APPENDIX C

TRANSPORTATION IMPACT STUDY

UNIVERSITY COMMUNITY PLAN AMENDMENT

Transportation Impact Study

JUNE 2016 | FINAL

Prepared By:

Kimley»Horn

1 EXECUTIVE SUMMARY

The purpose of the study is to evaluate the future transportation mode operations in the University community under four different network alternatives. The network alternatives vary by the inclusion or exclusion of two network modifications currently identified in the community plan: the Regents Road bridge crossing over Rose Canyon, and increased through lanes on Genesee Avenue between State Route 52 and Nobel Drive. The evaluation includes walkshed coverage and qualitative evaluation for pedestrians, quantitative level of stress and qualitative evaluation for bicycle facilities and connections, and level of service and travel time calculations for vehicles.

Network Alternatives

Four alternatives, labeled as A through D, were evaluated. The assumptions remained constant for each network, with the only differences noted as follows:

Future Year Network Scenarios	Alternative A	Alternative B	Alternative C	Alternative D
Regents Road Bridge	Yes	Yes	No	No
Genesee Avenue (Nobel – SR-52)	6 lanes	4 lanes	6 lanes	4 lanes

Active Transportation

There are no major changes to the pedestrian network planned for the University community. Site-specific improvements will need to be included as new development or redevelopment occurs. The Mid-Coast trolley project would provide pedestrian connections to existing facilities at each transit station in the community. The City will continue to upgrade curb ramps, crosswalks and traffic signal operations as part of their ongoing maintenance and operations programs. Specific pedestrian improvements are recommended at the following locations:

- *Nobel Drive at I-5; improve connections for the new transit center at La Jolla Village Square.*
- *Improve access to the pedestrian bridge across La Jolla Village Drive on the west side of the La Jolla Village Drive and Villa La Jolla Drive intersection*
- *Re-evaluate the need for the pedestrian bridge planned for La Jolla Village Drive just west of Genesee Avenue;*
- *Move the pedestrian crossing at the intersection of Torrey Pines Road and La Jolla Village Drive from the east leg of the intersection to the west leg;*
- *Install a new signal at the intersection of Eastbound La Jolla Village Drive and Gilman Drive to improve pedestrian safety;*
- *Install a new signal at the intersection of Genesee Avenue and State Route 52 Westbound ramps to improve pedestrian safety;*

The Regents Road bridge would provide an additional location to cross Rose Canyon at grade with existing roadways. Regardless of the alternative, pedestrian facilities would continue to be provided along Genesee Avenue across Rose Canyon.

This document provides an updated recommended bicycle network for the community that includes a mix of separated paths (Class I), bicycle lanes (Class II) including buffers, bicycle routes (Class III), and

protected bicycle lanes (Class IV). The proposed network provides more facilities with buffers or separation from vehicles than what was identified originally in the City's' Bicycle Master Plan. The completed network would reduce the bicycle level of traffic stress along the roadways where investments are made in bicycle facilities. It is recommended that signals along Class II and IV routes include detection for bicyclists and consideration of additional improvements such as bicycle boxes, no right-turn-on-red restrictions, and bicycle signal heads.

The bicycle network would be the same for each alternative, except for the type of facility that would be provided at the Regents Road and Genesee Avenue connections across Rose Canyon. With Alternatives A and B, the Regents Road bridge would provide an additional north-south bicycle facility connection for the community. Alternatives C and D also include the option of an active transportation bridge connecting Regents Road across Rose Canyon. Bicycle facilities would be provided on Genesee Avenue with each alternative, either as buffered Class II bicycle lanes (Alternatives A and D), or a separated facility shared with pedestrians (Alternatives B and C).

Public Transit

A key focus of the Regional Transportation Plan prepared by the San Diego Association of Governments (SANDAG) is to develop an ambitious and far-reaching transit network that significantly expands its role in our transportation network. This regional goal greatly applies to the transit network in the University community, as there have been significant investments made in the transit network that will be operational in the near future. As identified in the SANDAG 2050 Regional Transportation Plan (2050 RTP), these improvements include different transit options such as Light Rail Transit (LRT), Bus Rapid Transit (BRT), and High Frequency (Rapid) Local Bus. The Future Year conditions include transit projects identified in the 2050 RTP that are planned to be implemented by Year 2035.

Transit performance was evaluated primarily on auto travel time in the community, which is summarized as follows:

- *The auto travel time along Genesee Avenue is greatly affected by the network alternative. Alternative A results in significantly less travel time from one end of the community to the other when compared to other alternatives. Alternative D has the longest travel times along Genesee Avenue.*
- *The auto travel times along La Jolla Village Drive and Nobel Drive vary slightly between the alternatives but are not heavily influenced by the network alternative.*
- *The auto travel time along Regents Road is similar for Alternatives A and B, and similar for Alternatives C and D. There is not a good comparison between all alternatives as providing the bridge connection is a different travel pattern to evaluate and increases the overall distance traveled along Regents Road. No conclusions can be made from the Regents Road travel time analyses. Feedback received from MTS was that the Regents Road bridge would likely not be a candidate for many transit routes, so transit travel time in Regents Road may not be an important consideration.*

As identified by MTS, one of the key chokepoints identified that cause delays for buses in the community was the portion of Genesee Avenue between Nobel Drive and Governor Drive. For Alternatives C and D, the Genesee Avenue cross-section between Nobel Drive and State Route 52 should be evaluated to consider the implementation of transit bypass lanes at congested areas and intersections.

Street Network

A traffic model was prepared by SANDAG for existing and future community build-out conditions. Traffic counts obtained in 2015 were used to calibrate the existing model results. Using the attributes included in the calibrated existing model and the adopted community land uses, the future land use assumptions and roadway network variations were input and run to estimate future volumes.

Alternative D Travel Pattern Results

Alternative D represents a network that is similar to what currently exists with the planned network changes currently in the community facility financing plan, excluding the Regents Road bridge and Genesee Avenue project. These other network changes are described in depth within the report. Travel patterns under this alternative would remain similar to existing patterns.

Alternative A Travel Pattern Results

The changes in travel patterns for Alternative A show that Regents Road would experience increased volumes from one end of the community to the other. Lebon Drive would experience increased traffic as it acts as an alternative route to travel between Regents Road and La Jolla Village Drive. La Jolla Village Drive and Nobel Drive would experience some decreased volumes as people utilize Regents Road and Genesee Avenue to travel through the community rather than getting to and from the freeways on these corridors. Genesee Avenue across Rose Canyon and Governor Drive between Regents Road and Genesee Avenue would have reduced volumes. Volumes on I-5 and I-805 would be reduced as travel patterns shift towards using SR-52 for accessing North University on the Regents Road bridge. In general, travel decisions within the community are anticipated to rely less on the freeways and more on the internal community roadways.

Alternative B Travel Pattern Results

The changes in travel patterns for Alternative B would generally be similar to Alternative A, except the travel pattern decision changes would not reach vehicles on La Jolla Village Drive and Nobel Drive like they would for Alternative A.

Alternative C Travel Pattern Results

The change in travel patterns for Alternative C would primarily be drivers utilizing the increased capacity Genesee Avenue via SR-52 rather the I-5 and I-805 freeways adjacent to the community. There would be increased volume on Genesee Avenue across Rose Canyon.

Impacts

A total of 80 intersections throughout the community were analyzed to determine the operations during morning and afternoon peak periods. A total of 68 roadway segments throughout the community were analyzed using a volume-based daily capacity evaluation. Roadway segment travel times (based on speed) and midday intersection analyses were performed for intersections along Genesee Avenue, La Jolla Village Drive, Nobel Drive, and Regents Road. The following represents a summary of the intersection and roadway segment operations and travel time within the community.

The number of intersection locations that would operate at poor LOS (E or F) during at least one peak period and the number of locations that would be considered to have a significant impact when compared to existing conditions is as follows:

- *Alternative A: 29 locations operate at unacceptable LOS, 28 of which are a significant impact.*
- *Alternative B: 29 locations operate at unacceptable LOS, 29 of which are a significant impact.*
- *Alternative C: 31 locations operate at unacceptable LOS, 29 of which are a significant impact.*
- *Alternative D: 31 locations operate at unacceptable LOS, 30 of which are a significant impact.*

The number of roadway segment locations that would operate at poor LOS (E or F) using a volume-based analysis and the number of locations that would be considered to have a significant impact when compared to existing conditions is as follows:

- *Alternative A: 21 locations operate at unacceptable LOS, 19 of which are a significant impact.*
- *Alternative B: 23 locations operate at unacceptable LOS, 21 of which are a significant impact.*
- *Alternative C: 22 locations operate at unacceptable LOS, 20 of which are a significant impact.*
- *Alternative D: 23 locations operate at unacceptable LOS, 21 of which are a significant impact.*

The speed-based evaluations were performed using the roadway network associated with that alternative and the future peak-hour traffic volumes. A summary of the significant impacts by alternative when compared to existing conditions is as follows:

- *Alternative A would have significant impacts to all four corridors.*
- *Alternative B would have significant impacts to all four corridors.*
- *Alternative C would have significant impacts to three of the four corridors (no impact to Regents Road).*
- *Alternative D would have significant impacts to three of the four corridors (no impact to Regents Road).*

Freeways

Freeway operations for the adjacent Interstate 5, Interstate 805, and State Route 52 facilities were analyzed to determine the operations of the mainline and ramp connections. While the speed and density varies for each alternative, the number of locations that would operate at poor LOS (E or F) during at least one peak period and the number of locations that would be considered to have a significant impact when compared to existing conditions is the same for each alternative.

- *I-5 has one segment location with poor operations and a significant impact.*
- *All of I-805 (four segments) has poor operations and significant impacts.*
- *All of SR-52 (three segments) has poor operations and significant impacts.*

Similar to the freeway mainline analysis, the number of metered freeway on-ramp locations that would experience delays over 15 minutes and the number of metered on-ramp locations that would be considered to have a significant impact when compared to existing conditions is the same for each alternative.

- *Seven of the metered freeway on-ramps for I-5 have poor operations and significant impacts.*
- *One metered on-ramp for I-805 has poor operations and a significant impact.*

In general, the failing freeway segments are those that move traffic towards the University community in the morning and away from the University community in the afternoon.

Mitigations

Potential mitigation measures were identified for each location that would have a potential significant impact. Recommendations as to whether or not the mitigation measures should be implemented were then provided based on an evaluation of the network as a whole, and the effects that the vehicle-based mitigation measure would have on other modes of transportation and adjacent properties.

The locations where the mitigation measures are recommended are summarized in tables on the next few pages. Specific details regarding the mitigations are provided in the body of the document.

The number of intersections continuing to operate at unacceptable LOS during one or more peak periods after the implementation of the recommended mitigation measures is as follows:

Alternative A: 17 locations
Alternative B: 17 locations
Alternative C: 20 locations
Alternative D: 20 locations

The number of roadway segment locations continuing to operate at unacceptable LOS after the implementation of the recommended mitigation measures is as follows:

Alternative A: 16 locations
Alternative B: 15 locations
Alternative C: 16 locations
Alternative D: 17 locations

Vehicle speeds generally are increased along the corridors with the capacity improvements identified as mitigation to intersections and roadway segments.

Emergency Response

An emergency response time evaluation was performed for the area south of Rose Canyon, east of Interstate 5, west of Genesee Avenue, and north of State Route 52. The current response time to this area does not meet City goals. The average response time increases by a couple minutes regardless of the alternative selected. The Fire Department does not use average travel time as a quantifier when determining response time effectiveness, they use a 90% fractile which cannot be forecast in the future. However, based on the finding that average response times are expected to increase and existing response times are not currently meeting the City's goal response times, it can be concluded that regardless of the alternative selected, a new fire station would be beneficial to improve emergency response times in this area of the community.

Intersections Recommended for Mitigation Measures

ID	Intersection	Alt A (Regents Bridge & 6-lane Genesee)	Alt B (Regents Bridge & 4-lane Genesee)	Alt C (No Regents Bridge & 6-lane Genesee)	Alt D (No Regents Bridge & 4-lane Genesee)

1 INTRODUCTION

The following report has been prepared to determine and evaluate the traffic impacts associated with potential changes in the mobility network within the University community as part of a Community Plan Amendment. The purpose of the study is to evaluate the future transportation mode operations with inclusion or exclusion of two network modifications currently identified in the community plan: the Regents Road bridge crossing over Rose Canyon, and increased through lanes on Genesee Avenue between State Route 52 and Nobel Drive. The evaluation includes walkshed coverage and qualitative evaluation for pedestrians, quantitative level of stress and qualitative evaluation for bicycle facilities and connections, and level of service and travel time calculations for vehicles.

BACKGROUND

The University community is located at the northern border of the City of San Diego, encompassing the University Town Center, Torrey Pines, and the University of California San Diego (UCSD). The area commonly referred to as the “golden triangle”, bounded by Interstate 5 (I-5), Interstate 805 (I-805), and State Route 52 (SR-52), is located within the University community. **Figure 1-1** depicts the location of the University community in a regional context and **Figure 1-2** shows the community boundary in a localized context.

The future mobility network for the community is being updated using the adopted future land use. Specifically, the effort focuses on two projects currently in the community plan’s mobility network to determine if they should remain in the plan: 1) the construction of Regents Road bridge to cross Rose Canyon; and 2) the modification of Genesee Avenue to six lanes between Nobel Drive and State Route 52. Other community mobility network considerations are included in the evaluation to provide a comprehensive look at the future network.

REPORT LAYOUT

Due to the large amount of data required to represent four network alternatives, the body of the report includes summary tables that cover all alternatives and alternative-specific recommendations are included in the appendices:

Appendix A contains the future analysis results and recommended network for **Alternative A**.

Appendix B contains the future analysis results and recommended network for **Alternative B**.

Appendix C contains the future analysis results and recommended network for **Alternative C**.

Appendix D contains the future analysis results and recommended network for **Alternative D**.

The intent is that information on specific alternatives can be obtained quickly from the associated Appendix rather than finding the correct figure within the report. That said, it is important that at least Appendices A through D are included as part of this document when published and read.

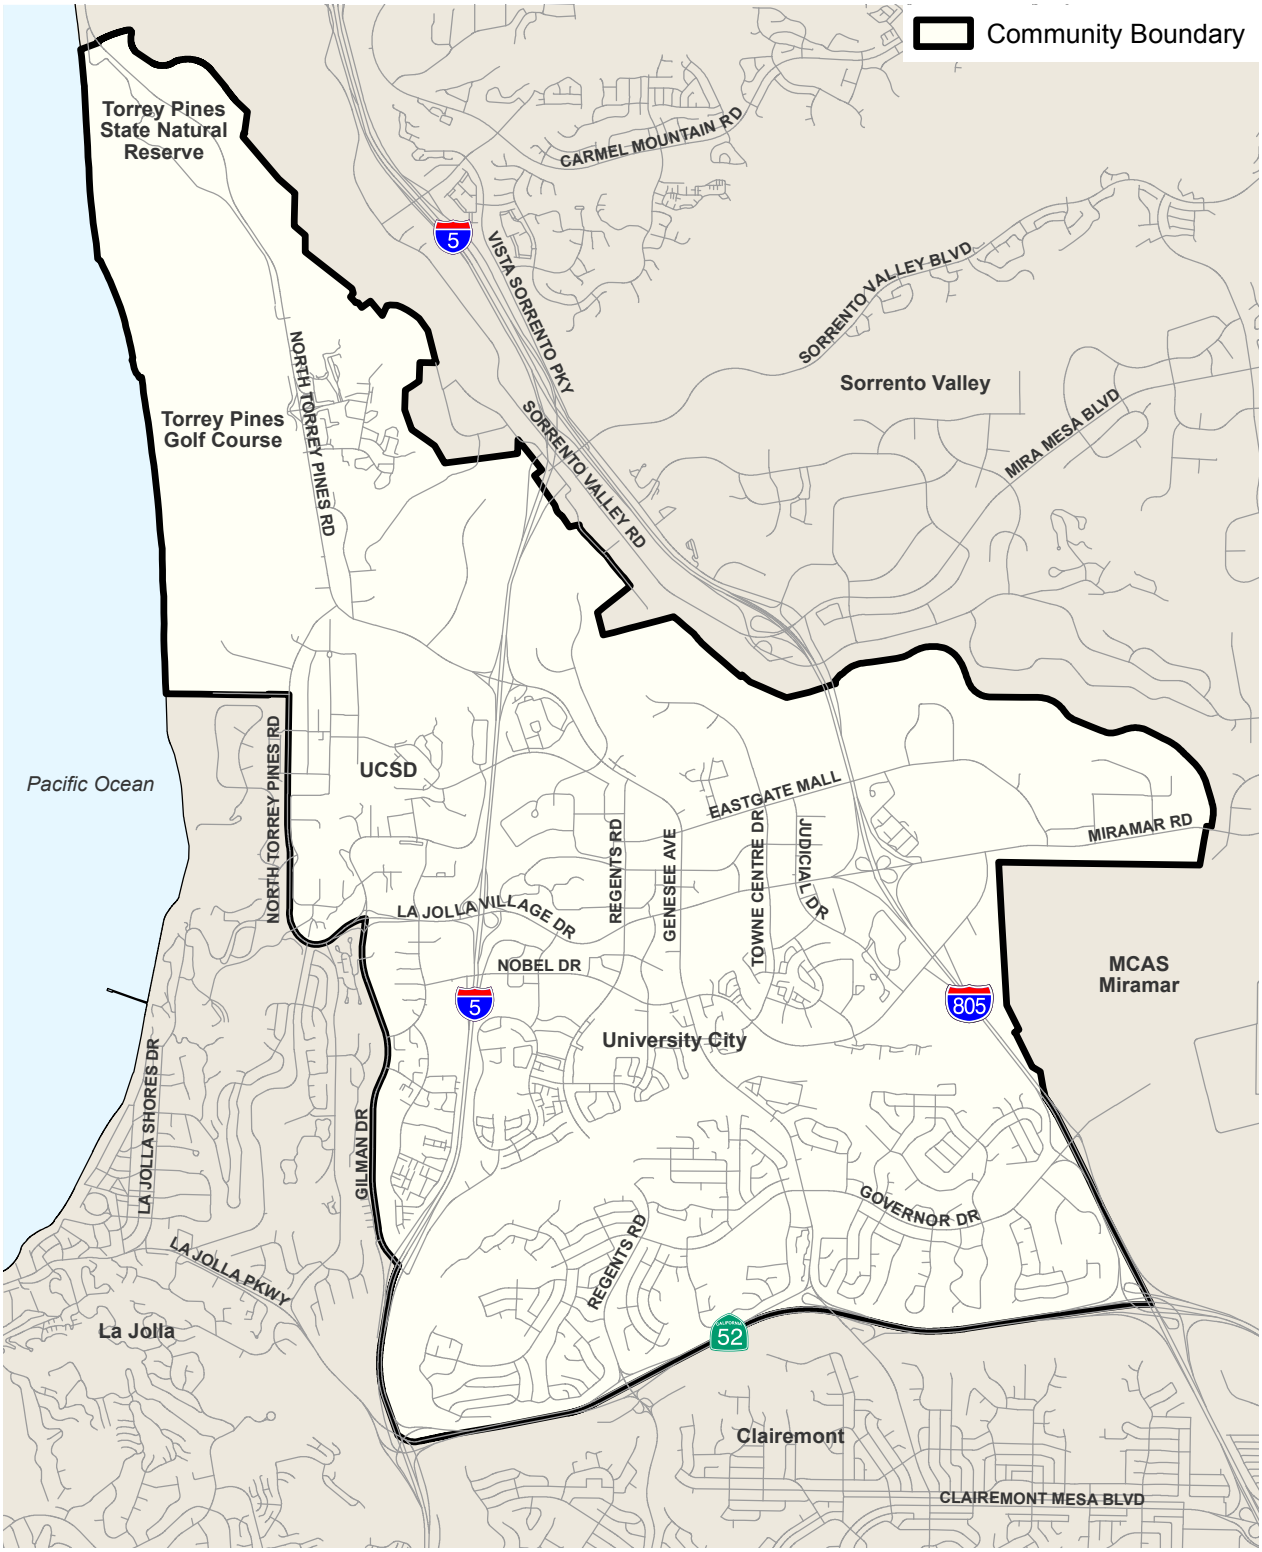
FIGURE 1-2



Community Boundary

2 STUDY AREA FACILITIES AND ANALYSIS SCENARIOS

The following section describes the study area included and the alternatives being evaluated.

STUDY AREA

INTERSECTIONS

Intersections to be studied were selected based on several factors, which included the following:

- Existing Circulation Element roadways intersecting with other existing Circulation Element roadways where both roadways function or are classified as a collector or higher
- Anticipated Circulation Element roadways intersecting with other existing and/or anticipated Circulation Element roadways where both roadways function or are classified as a collector or higher
- Key intersections where both intersecting streets meet one of the following conditions:
    - 4-lanes (or greater)
    - 3-lanes and carries over 15,000 Average Daily Traffic (ADT)
    - 2-lanes and carries over 10,000 ADT
- Intersections that provide access to/from freeways located within the University community
- Signalized intersections along corridors where travel time analysis is performed

It should be noted that some intersections selected for the study area fall just outside the University community boundary. However, these intersections were included in the analysis because they may influence or impact the flow of transportation within the community.

Based on the criteria listed above, a total of 80 intersections were selected for inclusion in the analysis study area. **Table 2-1** provides a list of the intersections and assigns an identification number to each intersection for use in this study. **Figure 2-1** graphically displays the location of each of the study intersections.

ROADWAY SEGMENTS AND CORRIDORS

Roadway segments to be studied were selected based on several factors, which included the following:

- Existing Circulation Element roadways functioning or classified as a collector or higher
- Anticipated Circulation Element roadways functioning or classified as a collector or higher
- Roadways providing access to/from freeways

Based on the criteria listed above, a total of 68 roadway segments were selected for analyses. **Figure 2-2** graphically displays the location of each of the roadway segments in the community selected for analyses.

Four corridors were selected to have travel time analysis performed to understand the flow of traffic through the community: La Jolla Village Drive, Genesee Avenue, Nobel Drive, and Regents Road.

FREEWAY SEGMENTS AND RAMPS

Freeway segments adjacent to the community and freeway entrance ramps that are controlled by ramp meters are included in the study area. **Figure 2-3** graphically displays the location of each of the freeway segments and entrance ramps included in the analysis study area, including facilities along I-5, I-805, and SR-52.

Study Area: Freeways and Ramps

ANALYSIS SCENARIOS

A total of five scenarios were analyzed as part of the project.

- Existing Conditions (2015)
- Future Year Alternative A
- Future Year Alternative B
- Future Year Alternative C
- Future Year Alternative D

Existing Conditions

1) Existing Conditions: Represents the traffic conditions of the street network as it exists in 2015. An existing conditions report was prepared under separate cover and provides additional information on the network in its current configuration. Appendix E contains the existing conditions information used as a baseline for this report.

Future Year Conditions

2) Future Year Conditions: The future community build-out conditions were developed based on land use and network assumptions within the University Community Plan area and superimposed on the SANDAG 2035 regional model. Four alternatives, labeled as A through D, were evaluated. **Table 2-2** summarizes the network differences for each alternative.

Table 2-2 Network Alternatives

Future Year Network Scenarios	Alternative A	Alternative B	Alternative C	Alternative D
Regents Road Bridge	Yes	Yes	No	No
Genesee Avenue (Nobel – SR-52)	6 lanes	4 lanes	6 lanes	4 lanes

ANALYSES INCLUDED

The evaluation process includes the following analyses:

- Qualitative look at pedestrian network connectivity
- Bicycle level of traffic stress
- Transit travel times using corridor speed
- Levels of service at all study intersections for the AM and PM peak-hours during a typical weekday
- Levels of service for the majority of study intersections along Genesee Avenue, La Jolla Village Drive, Nobel Drive, and Regents Road during the midday peak-hour during a typical weekday
- Levels of service for roadway segments within the community based on average daily traffic and theoretical capacity based on the roadway classification
- Levels of service along corridors within the community based on average speed
- Levels of service along freeway segments adjacent to the community based on density
- Length of queues and delays at freeway entrance ramps that have ramp meter operations

3 METHODOLOGY

The following section describes the methodology used to perform capacity analyses and determine significant impacts.

PEDESTRIAN NETWORK CONNECTIVITY AND BARRIERS

The existing conditions report provided an overview of where pedestrian connections currently are provided, areas that have missing pedestrian facilities, and barriers that may impede pedestrian connectivity. Based on that information, a few specific pedestrian connection areas were selected for further evaluation and are discussed in this report.

BICYCLE LEVEL OF TRAFFIC STRESS

The Mineta Transportation Institute published Low-Stress Bicycling and Network Connectivity *(2012)* which establishes a methodology for evaluating the level of stress for bicyclists riding on a designated bicycle facility associated with specific factors. The Mineta Transportation Institute document, developed by Mekuria et. al., used the City of San Jose as a test case to apply the methodology. This methodology applies a level of traffic stress (LTS) on a scale of LTS 1 (lowest stress) to LTS 4 (highest stress) for the following criteria:

- Roadway Classifications
- Roadway Speeds
- Bicycle Facility Type
- Bike Lane and Buffer Widths
- Intersection Control
- Bike Lane configuration at Intersections
- Parking Lane width
- Existing Transit Routes

LTS 1 facilities present little traffic stress and demand little attention from cyclists. They are suitable for almost all cyclists and attractive enough for a relaxing bike ride. LTS 2 facilities are suitable to most adult cyclists but demand more attention than might be expected from children. LTS 3 starts to introduce a stress level that not all adult cyclists feel comfortable with. LTS 4 is the highest level of stress and may be used by experienced bicyclists or not used at all.

Per the methodology guidance, both directions of a roadway segment are independently assigned a score between LTS 1 and LTS 4 based on several criteria shown in **Tables 3-1** through **3-7**. The resulting directional roadway level of traffic stress is the worst level of stress assigned to a segment from the several individual criteria scores. Where a table cell shows a result of "(no effect)", the resulting LTS for that situation is equal to the lower adjacent LTS.

Data on roadway classifications, speeds, bicycle facility type, and intersection control were compiled using field observations of roadway segments and intersections for classified roadways in the University community. This information was supplemented with measurement estimates and documentation of bike lane configurations at intersections taken from aerial imagery.

Table 3-1 Criteria for Bike Lanes Alongside a Parking Lane

	LTS ≥ 1	LTS ≥ 2	LTS ≥ 3	LTS ≥ 4
Street Width** (through lanes per direction)	1	(no effect)	2 or more	(no effect)
Sum of bike lane and parking lane width	15 ft. or more	14 or 14.5 ft.*	13.5 ft or less	(no effect)
Speed Limit or prevailing speed	25 mph or less	30 mph	35 mph	40 mph
Bike Lane Blockage	Rare	(no effect)	Frequent	(no effect)

Source: Mineta Transportation Institute, 2012

Note: (no effect)=factor does not trigger an increase to this level of traffic stress.

* If speed limit < 25 mph or Class= residential, then any width is acceptable for LTS 2.

Table 3-2 Criteria for Bike Lanes Not Alongside a Parking Lane

	LTS ≥ 1	LTS ≥ 2	LTS ≥ 3	LTS ≥ 4
Street Width (through lanes per direction)	1	2, if directions are separated by a raised median	More than 2 or 2 without a separating median	(no effect)
Bike Lane width (includes marked buffer and paved gutter)	6 ft. or more	5.5 ft or less	(no effect)	(no effect)
Speed Limit or prevailing speed	30 mph or less	(no effect)	35 mph	40 mph or more
Bike Lane Blockage	Rare	(no effect)	Frequent	(no effect)

Source: Mineta Transportation Institute, 2012

Note: (no effect)=factor does not trigger an increase to this level of traffic stress.

Table 3-3 Criteria for Level of Traffic Stress in Mixed Traffic

Speed Limits	Street Width		
	2-3 Lanes	4-5 Lanes	6+ Lanes
Up to 25 mph	LTS 1* or 2*	LTS 3	LTS 4
30 mph	LTS 2* or 3*	LTS 4	LTS 4
35+ mph	LTS 4	LTS 4	LTS 4

Source: Mineta Transportation Institute, 2012

Note: * Use lower value for streets without marked centerlines or classified as residential and with fewer than 3 lanes; use higher values otherwise.

Table 3-4 Level of Traffic Stress Criteria for Pocket Bike Lanes

Configuration	Level of Traffic Stress
Single right-turn lane up to 150 ft. long, starting abruptly while the bike lane continues straight, and having intersection angle and curb radius such that turning speed $\leq$ 15 mph.	LTS $\geq$ 2
Single right-turn lane up to 150 ft. long, starting abruptly while the bike lane continues straight, and having intersection angle and curb radius such that turning speed $\leq$ 20 mph.	LTS $\geq$ 3
Single right-turn lane in which the bike lane shifts to the left but the intersection angle and curb radius are such that turning speed is $\leq$ 15 mph.	LTS $\geq$ 3
Single right-turn lane with any other configuration; dual right-turn lanes; or right-turn lane along with an option (through-right) lane.	LTS $\geq$ 4

Source: Mineta Transportation Institute, 2012

Table 3-5 Level of Traffic Stress Criteria for Mixed Traffic in the Presence of a Right-turn Lane

Configuration	Level of Traffic Stress
Single right-turn lane with length $\leq$ 75 ft. and intersection angle and curb radius limit turning speed to 15 mph.	(No effect on LTS)
Single right-turn lane with length between 75 ft. and 150 ft., and intersection angle and curb radius limit turning speed to 15 mph.	LTS $\geq$ 3
Otherwise	LTS = 4

SIGNALIZED AND UNSIGNALIZED INTERSECTION LEVEL OF SERVICE

The Highway Capacity Manual (*HCM)* published by the Transportation Research Board establishes procedures to evaluate highway facilities and rate their ability to process traffic volumes. The terminology "level of service" is used to provide a qualitative evaluation based on certain quantitative calculations, which are related to empirical values. The criteria for the various levels of service designations for intersections are given in **Table 3-8**.

Level of service (LOS) for signalized intersections is defined in terms of delay, which is a measure of driver discomfort, frustration, fuel consumption, and loss of travel time. Specifically, LOS criteria are stated in terms of the average control delay per vehicle for the peak 15-minute period within the hour analyzed. The average control delay includes initial deceleration delay, queue move-up time, and final acceleration time in addition to the stop delay.

LOS for unsignalized intersections is determined by the computed or measured control delay and is defined for each movement. At an all-way stop control intersection, the delay reported is the average control delay of all movements at the intersection. At a one-way or two-way stop control intersection, the delay reported represents the worst movement, which is typically the left-turn from the minor street approach.

Synchro 9 (Trafficware) software was used to analyze the operations of both signalized and unsignalized intersections. Synchro provides the option to report methodologies for both 2010 and 2000 editions of the HCM. The 2010 version of the HCM is similar to the 2000 HCM methodologies but focused more on specific controller set ups. Due to the changes in the 2010 HCM, there are several limitations within Synchro that do not allow results to be produced for an intersection. Some of these limitations include:

- Exclusive pedestrian phases
- Exclusive U-turn phases
- Right turn overlaps with through movements
- Permissive left turns yielding to pedestrians at a T-intersection
- Split phasing

Since approximately thirty of the intersections within the community would not be able to produce results using the 2010 HCM methodology, the 2000 HCM methodology was used for the intersection analysis.

The following list contains the assumptions used for the existing conditions intersection analyses:

- HCM 2000 methodology
- Peak-hour factor (PHF) = Measured in field PHFs were used for the analysis
- Percent of heavy vehicle (PHV) = 2 percent
- Pedestrians & Bicycles = Volumes measured in field
- Signal Timing = Existing signal timing was used for all existing signalized intersections

The acceptable Level of Service (LOS) standard for intersections in the City of San Diego is LOS D.

Table 3-8 LOS Criteria for Intersections

LOS	Control Delay (sec/veh)		Description
	Signalized Intersections (a)	Unsignalized Intersections (b)	
A	≤10.0	≤10.0	Operations with very low delay and most vehicles do not stop.
B	>10.0 and ≤20.0	>10.0 and ≤15.0	Operations with good progression but with some restricted movement.
C	>20.0 and ≤35.0	>15.0 and ≤25.0	Operations where a significant number of vehicles are stopping with some backup and light congestion.
D	>35.0 and ≤55.0	>25.0 and ≤35.0	Operations where congestion is noticeable, longer delays occur, and many vehicles stop. The proportion of vehicles not stopping declines
E	>55.0 and ≤80.0	>35.0 and ≤50.0	Operations where there is significant delay, extensive queuing, and poor progression.
F	>80.0	>50.0	Operations that is unacceptable to most drivers, when the arrival rates exceed the capacity of the intersection.

ROADWAY SEGMENT CAPACITY LEVEL OF SERVICE ANALYSIS

In order to determine the operations along the study area roadway segments, capacity thresholds and associated LOS have been developed by the City of San Diego and is used as a reference. **Table 3-9** presents this information. The segment traffic volumes under LOS E as shown in this table are considered to be the capacity of the roadway. It should be noted that the values listed in the table are planning-level estimates only. The actual operations of a roadway segment would be affected by the type and frequency of traffic control, terrain, lane width, percent of heavy vehicles, and other factors.

Table 3-9 City of San Diego Roadway Segment Capacity and LOS Summary

Road Class	Lanes	Cross Section[1]	A	B	C	D	E
Freeway	8		60,000	84,000	120,000	140,000	150,000
Freeway	6		45,000	63,000	90,000	110,000	120,000
Freeway	4		30,000	42,000	60,000	70,000	80,000
Expressway	6	102/122	30,000	42,000	60,0000	70,000	80,000
Prime Arterial*	8		35,000	50,000	70,000	75,000	80,000
Prime Arterial	6	102/122	25,000	35,000	50,000	55,000	60,000
Major Arterial*	7		22,500	31,500	45,000	50,000	55,000
Major Arterial	6	102/122	20,000	28,000	40,000	45,000	50,000
Major Arterial*	5		17,500	24,500	35,000	40,000	45,000
Major Arterial	4	78/98	15,000	21,000	30,000	35,000	40,000
Collector	4	72/92	10,000	14,000	20,000	25,000	30,000
Collector (continuous left-turn lane)*	3		7,500	10,500	15,000	18,750	22,500
Collector(No center lane) (continuous left-turn lane)	4 2	64/84 50/70	5,000	7,000	10,000	13,000	15,000
Collector (No fronting property)	2	40/60	4,000	5,500	7,500	9,000	10,000
Collector (commercial-industrial fronting)	2	50/70	2,500	3,500	5,00	6,500	8,000
Collector (multifamily)	2	40/60	2,500	3,500	5,000	6,500	8,000
Sub-Collector (single-family)	2	36/56	---	---	2,200	---	---

Notes:

The volumes and the average daily level of service listed above are only intended as a general planning guideline.

Levels of service are not applied to residential streets since their primary purpose is to serve abutting lots, not carry through traffic. Levels of service normally apply to roads carrying through traffic between major trip generators and attractors.

[1]Cross Section: Curb to Curb width (feet)/Right-of-way width (feet)

CORRIDOR SPEED ANALYSIS

Four corridors within the community were selected for analysis of travel time during the peak hours in addition to the estimated daily capacity; these corridors include Genesee Avenue, La Jolla Village Drive, Nobel Drive, and Regents Road. Genesee Avenue and La Jolla Village Drive are the primary arterials serving the community. Nobel Drive and Regents Road are major roads that provide alternative routes. The corridor travel time analysis is simulated using the Synchro software. The analysis was performed using the 2000 HCM methodology which provides a computation of LOS using average vehicle travel speed. This average speed is computed by adding the running time between signalized intersections assuming free flow speed along the corridor and the control delay associated with each signalized intersection. **Table 3- 10** presents the arterial LOS criteria based on the urban street class and average travel speed.

Table 3-10 HCM 2000 Urban Street LOS Criteria

Urban Street Class	**I**	**II**	**III**	**IV**
Range of free-flow speeds (FFS)	55 to 45 mi/h	45 to 35 mi/h	35 to 30 mi/h	35 to 25 mi/h
Typical FFS	50 mi/h	40 mi/h	35 mi/h	30 mi/h
LOS	**Average Travel Speed (mi/h)**			
A	> 42	> 35	> 30	> 25
B	>34 – 42	> 28 – 35	> 24 – 30	> 19 – 25
C	> 27 – 34	> 22 – 28	> 18 – 24	> 13 – 19
D	> 21 – 27	> 17 – 22	> 14 – 18	> 9 – 13
E	> 16 – 21	> 13 – 17	> 10 – 14	> 7 -9
F	≤ 16	≤ 13	≤ 10	≤ 7

FREEWAY SEGMENTS

Freeway segments were analyzed during the AM and PM peak hours based on the methodologies outlined in the 2000 HCM. The free-flow speed of each freeway segment was calculated based on a base free-flow speed of 65 mph, which is consistent with Caltrans' requirements for analyzing freeway segments. Factors affecting the free-flow speed of each segment include the lane width, lateral clearance, number of lanes, interchange density, and geometric design. Based on each segment's free-flow speed, the density was calculated, which is the primary factor for determining the segment's LOS. **Table 3-11** presents the freeway segment criteria based on density.

Table 3-11 HCM 2000 Freeway Segment LOS Criteria

LOS	Density Range (pc/mi/ln)*
A	0 – 11
B	> 11 – 18
C	> 18 – 26
D	> 26 – 35
E	> 35 – 45
F	>45

Source: HCM 2000, Page 23-3
* passenger car per mile per lane

FREEWAY RAMP METERS

Ramp metering is a means of controlling the volume of traffic entering the freeway with the goal of improving the safety, traffic operations, and flow on the freeway main lanes. Freeway ramp meter analysis estimates the peak hour queues and delays at freeway ramps by comparing existing volumes to the meter rate at the given location. The fixed rate and uniform 15-minute maximum delay approaches are two approaches that are currently accepted by the City. The fixed rate approach is based solely on the specific time intervals that ramp meters are programmed to release traffic. The uniform 15-minute approach is based on the assumption that any demand exceeding 15-minutes will seek an alternate route or will choose to use the ramp during other time periods when the traffic demand is lower. The fixed rate approach was utilized in this study to analyze freeway ramp meters.

The excess demand at a freeway ramp forms the basis for calculating the maximum queues and maximum delays anticipated at each location. Substantial queues and delays can form where demand significantly exceeds the meter rate. This approach assumes a static rate throughout the course of the peak hour; however, Caltrans has indicated that the meter rates operate in a traffic responsive mode and based on the level of traffic using the on-ramp. To the extent possible, the meter rate in the field is set such that the queue length does not exceed the available storage, smooth flows on the freeway mainline are maintained, and there is no interference to arterial traffic.

Existing meter rates were provided by Caltrans and include a range between the least and most restrictive rates. Since many of the freeways operate at or above its capacity during the peak hours, the most restrictive rate was used for the analysis.

The following list contains the assumptions used for the existing conditions ramp meter analyses based on field observations:

- Storage length measured from recent aerials of the area
- 20% High Occupancy Vehicle (HOV)
- 80% Single Occupancy Vehicle (SOV) and evenly distributed between the SOV lanes
- 25-foot vehicle length

SIGNIFICANCE THRESHOLDS

The City of San Diego and Caltrans have developed acceptable threshold standards to determine the significance of project impacts to intersections, roadway segments, freeway segments, and freeway ramp metering. At intersections, the measurement of effectiveness (MOE) is based on allowable increases in delay. Along roadway segments and freeway segments, the MOE is based on allowable increases in the volume-to-capacity (v/c) ratio. Along corridors, the MOE is based on allowable increases in speed. At a freeway ramp meter, the MOE is based on allowable increases in delay, measured in minutes.

LOS F is not acceptable for any approach leg except for side streets on an interconnected arterial system. If vehicle trips from a project cause an intersection approach leg to operate at LOS F, except in the cases of side streets on an interconnected arterial system, this would be considered a significant project traffic impact that requires mitigation. At intersections that are expected to operate at LOS E or F without the project, the allowable increase in delay is two seconds at LOS E and one second at LOS F with the addition of the project. If vehicle trips from a project cause the delay at an intersection to increase by more than the allowable threshold, this would be considered a significant project impact that requires mitigation. Also, if the project causes an intersection that was operating at an acceptable LOS to operate at LOS E or F, this would be considered a significant project impact that requires mitigation.

For roadway segments that are forecasted to operate at LOS E or F with the project, the allowable increase in v/c ratio is 0.02 at LOS E and 0.01 at LOS F. If vehicle trips from a project cause the v/c ratio to increase by more than the allowable threshold, this would be considered a significant project traffic impact that requires mitigation. Also, if the project causes a street segment that was operating at an acceptable LOS to operate at LOS E or F, this would be considered a significant impact that requires mitigation.

Where the roadway segment operates at LOS E or F, if the intersections at the ends of the segment are calculated to operate at an acceptable LOS with the project; and a peak hour HCM arterial analysis for the same segment shows that the segment operates at an acceptable LOS with the project; then the project impacts are determined to be less than significant and no mitigation is required. If analysis shows either the intersections or segment under the peak hour HCM analysis do not operate acceptably, the project impacts are considered significant and unmitigated, requiring the adoption of findings of infeasibility and a statement of over-riding considerations before the project may be approved.

In certain instances mitigation may not be required even if a roadway segment operates at LOS E or LOS F. In such cases the following three conditions must all be met:

1. The roadway is built to its ultimate classification per the community plan;
2. The intersections on both ends of the failing segment operate at an acceptable LOS; and
3. An HCM arterial analysis indicates an acceptable LOS on the segment.

For corridor travel times, the allowable increase in speed is 0.5 miles per hour (mph) at LOS E and 1 mph at LOS F. If vehicle trips from a project cause the speed to decrease by more than the allowable threshold, this would be considered a significant project traffic impact that requires mitigation.

For freeway segments that are forecasted to operate at LOS E or F with the project, the allowable increase in v/c ratio is 0.01 at LOS E and 0.005 at LOS F. If vehicle trips from a project cause the v/c ratio to increase by more than the allowable threshold, this would be considered a significant project traffic impact that requires mitigation. Also, if the project causes a freeway segment that was operating at an acceptable LOS to operate at LOS E or F, this would be considered a significant impact that requires mitigation.

If vehicle trips from a project cause a metered ramp with a delay of 15 minutes per vehicle or higher to increase its delay by more than 2 minutes per vehicle, this would be considered a significant project traffic impact that requires mitigation if the freeway segment operates at LOS E or F.

Table 3-12 shows the criteria for determining levels of significance for the different facilities in the study area.

Table 3-12 Significance Criteria For Facilities in Study Area

Facility	Measures of Effectiveness (MOE)	Significance Threshold [(a)]
Intersection	Seconds of Delay	>2.0 seconds at LOS E or >1.0 second at LOS F
Roadway Segment	ADT, v/c Ratio	>0.02 at LOS E, or >0.01 at LOS F
Corridor	Speed	>1.0 mph at LOS E, or >0.5 mph at LOS F
Freeway Segment	v/c Ratio	>0.01 at LOS E, or >0.005 at LOS F
Freeway Ramp Meter	Minutes of delay per vehicle	>2.0 minutes for freeway segments operating at LOS E, and > 1.0 minutes for freeway segments operating at LOS F. The criteria only apply for ramp meters where the delay without project is 15 minutes or higher.

Source: City of San Diego Significance Determination Thresholds, page 72, January 2011.

Notes:

(a) Significance threshold applies only when the type of facility operates at LOS E or F.

If a project adds any increment of delay to cause the operations of an intersection to go from LOS D to either LOS E or LOS F, then the project is considered to cause a significant impact.

4 EXISTING SETTING

This section describes the existing mobility network within the University community.

SUMMARY OF EXISTING FACILITIES

Data regarding the existing setting was collected in May of 2015 and is documented in more detail in the University Community Existing Conditions Report. A summary of the network is provided in the following figures:

- **Figure 4-1** illustrates the existing pedestrian network and barriers;
- **Figure 4-2** illustrates the existing bicycle network;
- **Figure 4-3** illustrates the existing roadway classifications;
- **Figure 4-4** illustrates the transit network; and
- **Appendix E** provides the existing intersection geometrics.

This information is used as a baseline for comparison to the Future Year () network evaluations.

When preparing this report and from comments provided by the community, some minor discrepancies were found in the Existing Conditions Report. Information provided in this report is more current and supersedes information provided in the Existing Conditions Report.

FIGURE 4-1

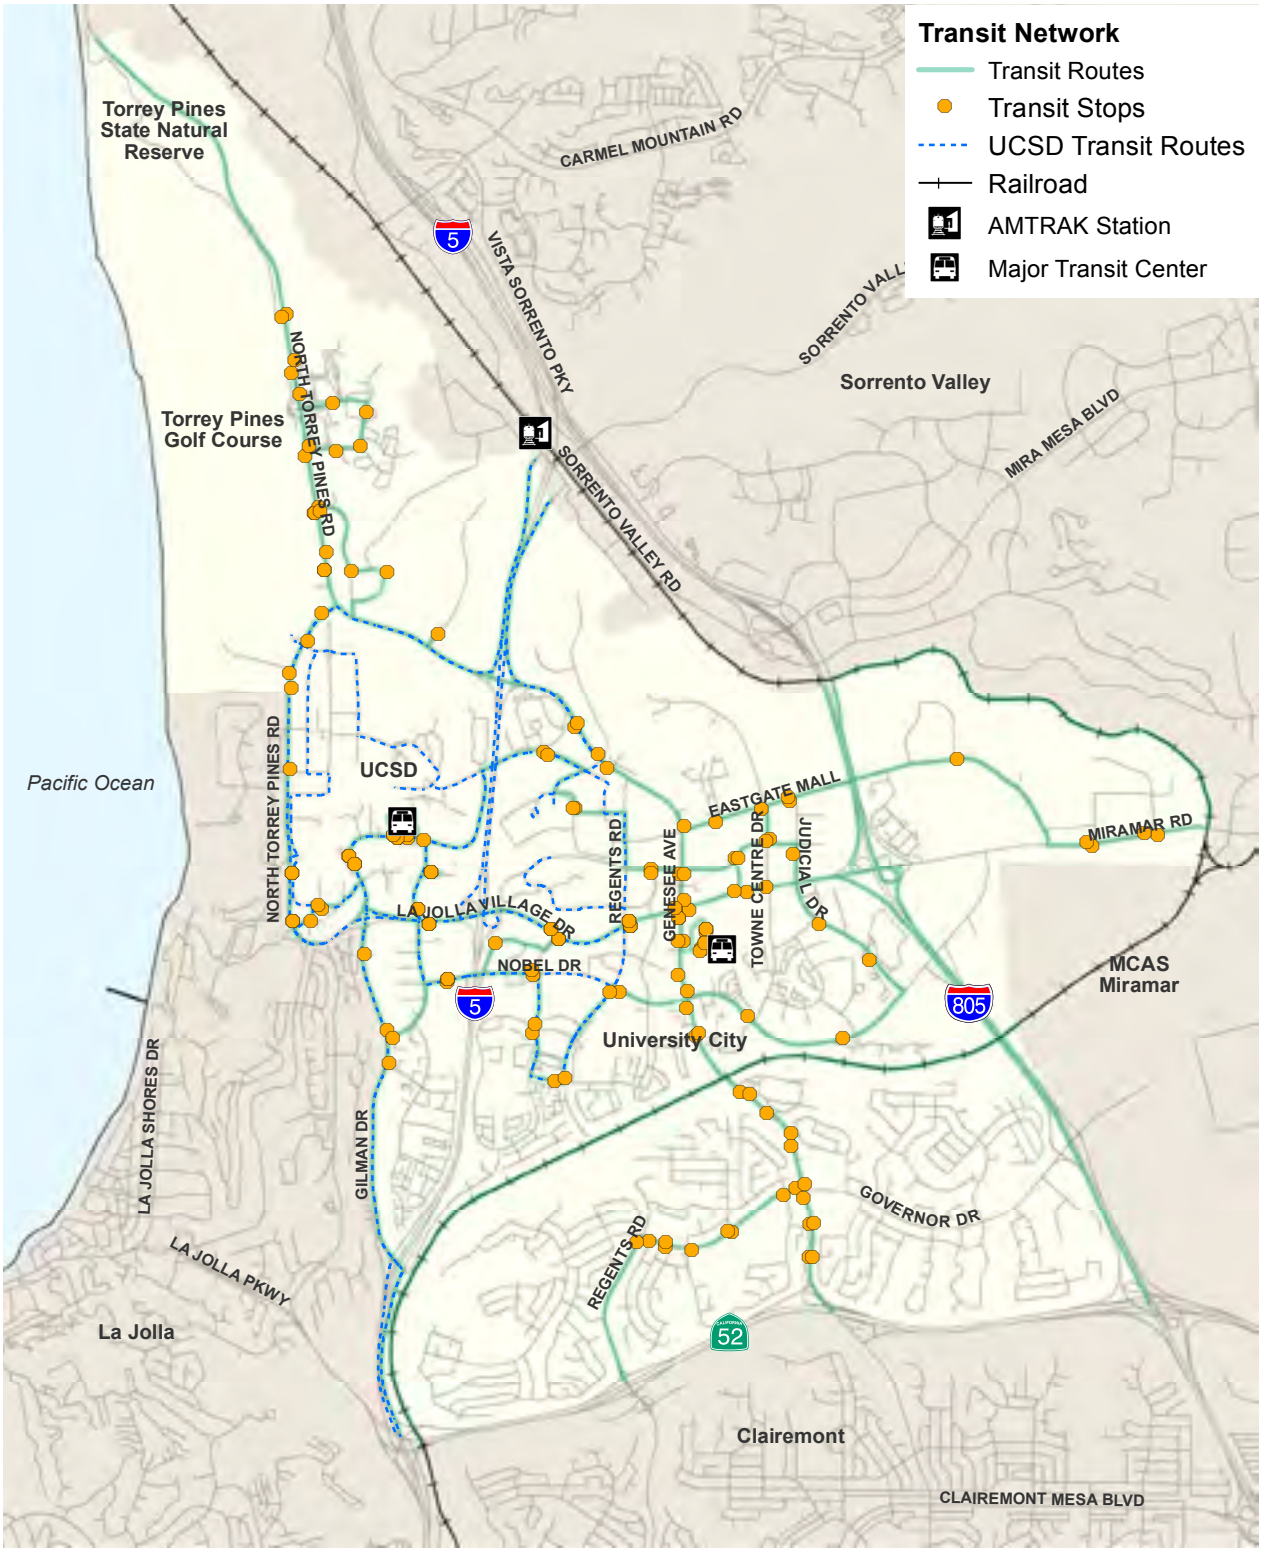
Roadway Functional Classifications

FIGURE 4-4



Existing Transit Routes

DESCRIPTION OF ROAD NETWORK

The following section provides a description of the existing Circulation Element streets within the University community. Ultimate roadway classifications are taken from the current University Community Plan, last updated October 2014. The portions of the roadways described are intended to reflect the areas within the given community, and may not reflect the entirety of the roadway. Functional classifications are based on field observations performed during preparation of this report. The City of San Diego Bicycle Master Plan (City BMP) proposes several bicycle facilities in this Community as noted in the roadway descriptions below.

URBAN STREETS

Eastgate Mall functions as a two-way east-west, 2 and 4-lane Collector. Between Regents Road and Genesee Avenue, Eastgate Mall is a 2-lane Collector with a continuous two-way left-turn lane, angled parking on both sides of the street and a curb to curb width of 70 feet. The posted speed limit is 25 mph. Between Genesee Avenue and Easter Way, Eastgate Mall is a 4-lane Collector with a continuous two-way left-turn lane, no parking, bike lanes on both sides of the street and a curb to curb width of 70 feet. Eastgate Mall turns into a 4-lane Major Arterial with a raised median, no parking, bike lanes on both sides of the street and a curb to curb width of 70 feet between Easter Way and the I-805 Freeway Overpass. The posted speed limit is 35 mph. Within these segments, Eastgate Mall is lined with sidewalks and curbs on both sides of the street. Over the I-805 Freeway Overpass, Eastgate Mall is classified as a 2-lane Collector with no parking, bike lanes on both sides of the street, and a curb to curb width of 40 feet. Within this segment, Eastgate Mall is lined with sidewalks on the south side of the street and curbs on both sides. The posted speed limit is 45 mph. Eastgate Mall between Eastgate Drive and Miramar Road is classified as a 2-lane Collector with a continuous left-turn lane, and a curb to curb width of 50 feet. Within this segment, the roadway has sidewalk, curb, and parking on the north side of the street. The posted speed limit is 45 mph. The ultimate adopted Community Plan street classification for Eastgate Mall is a 4-lane Collector between Regents Road and Genesee Avenue, a 4-way Major between Genesee Avenue and Towne Centre Drive and a 4-lane Collector between Towne Centre Drive and Miramar Road. The City BMP proposes Eastgate Mall as a Class II (Bike Lane) facility throughout the extents of the roadway.

Executive Drive functions as a two-way east-west, 4-lane Collector with a continuous two-way left-turn lane and a curb to curb width of 60 feet from Regents Road to Regents Park Row and 70 feet from Regents Park Row to Judicial Drive. Executive Drive is lined with sidewalks and curbs with parallel parking available on both sides of the street for the entire length of the street except for the segment between Regents Park Row and Genesee Avenue. The posted speed limit is 30 mph. Executive Drive has been built to the ultimate adopted Community Plan street classification except for the segment between Towne Centre Drive and Judicial Drive which is classified as a 4-lane Major. The City BMP proposes Executive Drive as a Class III (Bike Route) facility.

Executive Way functions as a two-way north-south, 4-lane Collector with a continuous two-way left-turn lane and a curb to curb width of 70 feet. Executive Way is lined with sidewalks and curbs with parallel parking available on both sides of the street for the entire length of the street. Executive Way has reached the ultimate adopted Community Plan street classification.

Genesee Avenue functions as a two-way north-south, 4 and 6-lane Arterial. Between North Torrey Pines Road and I-5, Genesee Avenue is a 6-lane Prime Arterial with bike lanes on both sides of the street, no parking, raised medians, and a curb to curb width ranging from 80 feet to 120 feet. Over I-5, Genesee Avenue turns into a 4-lane Major Arterial with no parking or bike lanes and a curb to curb width of 70 feet. Genesee Avenue between I-5 and Regents Road is a 6-lane Prime Arterial with bike lanes on both sides of the street, no parking, raised medians and a curb to curb width of 110 feet. Genesee Avenue between Regents Road and La Jolla

Villa is a 6-lane Major Arterial with bike lanes on both sides of the street, no parking, raised medians and a curb to curb width of 110 feet. Between La Jolla Village Drive and Esplanade Court, Genesee Avenue is a 4-Lane Major Arterial with bike and bus lanes, raised medians, no parking, and a curb to curb width of 110 feet. Genesee Avenue between Esplanade Court and Nobel Drive is a 6-lane Major Arterial with parking on the west side of the street, bike lanes on both sides of the street, raised medians, and a curb to curb width of 110 feet. Between Nobel Drive and Lehrer Drive, Genesee Avenue is a 4-lane Major Arterial with no parking, bike lanes on both sides of the street, raised medians, and a curb to curb width of 80 feet. Genesee Avenue is lined with sidewalks and curbs on both sides of the street for the entire length of the street. The posted speed limit is 45 mph. Access to I-5 and SR-52 is provided on Genesee Avenue. The ultimate adopted Community Plan street classification for Genesee Avenue is a 6-lane Collector between Nobel Drive and SR-52 Ramps and a 4-lane Major Arterial between the SR-52 Ramps and Lehrer Drive. Genesee has reached the ultimate adopted Community Plan street classification on all other road segments.

Gilman Drive functions as a two-way north-south, 4-lane Collector between UCSD Campus and Via Alicante with bike lanes on both sides of the street and a curb to curb width of 90 feet. Throughout this segment, Gilman Drive is lined with sidewalks and curbs with parallel parking available on the west side of the street, with parking available on both sides of the street between Evening Way and Villa La Jolla Drive. Gilman Drive between Via Alicante and I-5 is classified as a 4-lane Major Arterial with bike lanes, raised medians, and a curb to curb width of 70 feet. Parallel parking is only available on the west side of the street in front of the housing development north of Gilman Court. Between the housing development and I-5, Gilman Drive is lined with sidewalks and curbs on the west side of the street. The posted speed limit is 45 mph. Access to I-5 is provided at the southern terminus of Gilman Drive. The ultimate adopted Community Plan street classification for Gilman Drive is a 4-lane Major.

Golden Haven Drive functions as a two-way east-west, 4-lane Major Arterial with bike lanes on both sides of the street, no parking, raised medians and a curb to curb width of 74 feet. Golden Haven Drive is lined with sidewalks and curbs on both sides of the street for the entire length of the street. The posted speed limit is 35 mph. The ultimate adopted Community Plan street classification for Golden Haven Drive has been built.

Governor Drive functions as a two-way east-west, 4-lane Major Arterial with raised medians and a curb to curb width of 70 feet. Governor Drive is lined with sidewalks and curbs on both sides of the street for the entire length of the street. Parallel parking is available on both sides of the street along most segments of the roadway west of Gullstrand Street. Bike lanes are on both sides of the street between Genesee Avenue and Gullstrand Street. The posted speed limit is 35 mph. Access to I-805 is provided at the eastern terminus of Governor Drive. The ultimate adopted Community Plan street classification for Governor Drive is a 4-lane Major. The City BMP proposes Governor Drive west of Genesee Avenue as a Class II (Bike Lane) or III (Bike Route).

Judicial Drive functions as a two-way north-south, 4-lane Major Arterial with raised medians and a curb to curb width of 80 feet. Judicial Drive is lined with sidewalks and curbs on both sides of the street for the entire length of the street. Parallel parking is available north of Executive Drive with bike lanes on both sides of the street south of Executive Drive. Judicial Drive has reached its ultimate adopted Community Plan street classification. The City BMP proposes Judicial Drive as a Class II (Bike Lane) facility north of Executive Drive.

La Jolla Scenic Drive functions as a two-way north-south, 4-lane Major Arterial with raised medians and a curb to curb width of 80 feet. La Jolla Scenic Drive is lined with sidewalks and curbs with parallel parking available on both sides of the street for the entire length of the street. The ultimate adopted Community Plan does not include a street classification for La Jolla Scenic Drive. The City BMP proposes La Jolla Scenic Drive as a Class II (Bike Lane) facility.

La Jolla Village Drive functions as a two-way east-west, 6-lane Prime Arterial between Revelle College Drive and the I-5 SB Ramps and a 6-lane Major Arterial between the I-5 SB Ramps and the I-805 SB Ramps. La Jolla Village Drive has a curb to curb width of 120 feet and is lined with sidewalks and curbs on both sides of the street except between I-5 and Lebon Drive where sidewalk is only on the south side of the street. Parallel parking is available on both sides of the street east of I-5 and bike lanes are on both sides of the street west of La Jolla Scenic Drive. The posted speed limit is 45 mph. Access to I-5 and I-805 is provided along La Jolla Village Drive. The ultimate adopted Community Plan street classification for La Jolla Village Drive is a 8-lane Primary Arterial between Villa La Jolla Drive and the I-5 Ramps and Judicial Drive and the I-805 Ramps. All other segments of La Jolla Village Drive have reached their ultimate adopted Community Plan street classification. The City BMP proposes La Jolla Village Drive as a Class II (Bike Lane) facility.

Lebon Drive functions as a two-way north-south, 4 and 5-lane Major Arterial. Between Palmilla Drive and Nobel Drive, Lebon Drive is classified as a 4-lane Major Arterial with raised medians and a curb to curb width of 80 feet. Throughout this segment, parallel parking is available on both sides of the street. This segment is also classified as a Class III (Bike Route) facility. Lebon Drive between Nobel Drive and La Jolla Village Drive is classified as a 5-lane Major Arterial with raised medians, no parking, and a curb to curb width of 80 feet. Lebon Drive is lined with sidewalks and curbs on both sides of the street for the entire length of the street. The posted speed limit is 35 mph. The ultimate adopted Community Plan street classification for Lebon Drive has been reached. The City BMP proposes all of Lebon Drive as a Class II (Bike Facility) facility.

Miramar Road functions as a two-way east-west, 6 and 8-lane Prime Arterial. Between I-805 and Eastgate Mall, Miramar Road is classified as an 8-lane Prime Arterial with raised medians, bike lanes, no parking and a curb to curb width of 124 feet. Between Eastgate Mall and Camino Santa Fe, Miramar Road is classified as a 6-lane Prime Arterial with raised medians, bike lanes, no parking and a curb to curb width of 100 feet. Miramar Road is lined with sidewalks and curbs on both sides of the street east of Nobel Drive. West of Nobel Drive, Miramar Road has sidewalks and curbs on the north side of the street. Miramar Road has buffered bike lane facilities between Miramar Mall and Camino Santa Fe. The posted speed limit is 50 mph. Access to I-805 is provided on Miramar Road. The ultimate adopted Community Plan street classification for Miramar Road has been reached.

North Torrey Pines Road functions as a two-way north-south, 4 and 6-lane Arterial. Between Science Park Road and Genesee Avenue, North Torrey Pines Road is classified as a 6-lane Prime Arterial with raised medians, bike lanes, no parking, and a curb to curb width of 120 feet. Between Genesee Avenue and Revelle College Drive, North Torrey Pines Road is classified as a 6-lane and 4-lane Major Arterial with raised medians, bike lanes, no parking, and a curb to curb width of 80 feet. North Torrey Pines Road is lined with sidewalks and curbs on both sides of the street for the entire length of the street. The posted speed limit is 45 mph. The ultimate adopted Community Plan street classification for North Torrey Pines Road has been reached.

Nobel Drive functions as a two-way east-west, 4, 5 and 6-lane Arterial. Between Villa La Jolla Drive and I-5, Nobel Drive is classified as a 4-lane Major Arterial with raised medians, bike lanes, no parking, and a curb to curb width of 80 feet. Nobel Drive between I-5 and Genesee Avenue is classified as a 6-lane Major Arterial with raised medians and a curb to curb width of 100 feet. Parallel parking is available on both sides of the street between Lebon Drive and Regents Road. Throughout the rest of the segments, Nobel drive has bike lanes on both sides of the street. The posted speed limit is 40 mph. Nobel Drive turns into a 4-lane Major Arterial between Genesee Avenue and Towne Centre Drive with raised medians, parallel parking available on the south side of the street between Lombard Place and Via Las Rambles, and a curb to curb width of 90 feet. The posted speed limit is 35 mph. Between Towne Centre Drive and Judicial Drive, Nobel Drive is classified as a 6-lane Prime Arterial with raised medians, bike lanes, no parking, and a curb to curb width of 100 feet. The posted speed limit is 45 mph. Between Judicial Drive and Avenue of Flags, Nobel Drive is classified as a 5-lane Major

Arterial with raised medians, bike lanes, no parking and a curb to curb width of 100 feet. Nobel Drive from Avenue of Flags to Miramar Road is classified as a 4-lane Major Arterial with raised medians, bike lanes, no parking, and a curb to curb width of 80 feet. Nobel Drive is lined with sidewalks and curbs on both sides of the street for the entire length of the street. Access to I-5 and I-805 is provided along Nobel Drive. The ultimate adopted Community Plan street classification for Nobel Drive has been reached for all segments. The City BMP proposes Nobel Drive a Class II (Bike Lane) facility between Genesee Avenue and Towne Centre Drive.

Regents Road functions as a two-way north-south roadway that is divided by Rose Canyon. North of Rose Canyon between Genesee Avenue and Eastgate Mall, Regents Road is classified as a 2-lane Collector with a continuous left-turn lane, no parking, and a curb to curb width of 40. The posted speed limit is 25 mph. Between Eastgate Mall and La Jolla Village Drive, Regents Road is classified as a 4-lane Collector with a continuous left-turn lane, bike lanes, no parking, and a curb to curb width of 65 feet. Regents Road between La Jolla Village Drive and Nobel Drive is classified as a 5-lane Major Arterial with raised medians, parallel parking on both sides of the street and a curb to curb width of 90 feet. South of Nobel Drive, Regents Road is classified as a 4-lane Major Arterial with raised medians, parallel parking on both sides of the street, and a curb to curb width of 70 feet. North of Rose Canyon, Regents Road is lined with sidewalks and curbs on both sides of the street for the entire length of the street. The posted speed limit is 40 mph. The City BMP proposes Regents Road as a Class II (Bike Lane) or a Class III (Bike Route) facility south of Nobel Drive. South of Rose Canyon north of Governor Drive, Regents Road is classified as a 2-lane Collector with no parking and a curb to curb width of 30 feet. Between Governor Drive and Luna Avenue, Regents Road is classified as a 4-lane Major Arterial with raised medians, bike lanes, no parking, and a curb to curb width of 80 feet. Regents Road has buffered bike lanes between Pennant Way and Luna Avenue. South of Rose Canyon, Regents Road is lined with sidewalks and curbs on the east side of the street for the entire length of the street. The posted speed limit is 50 mph. Access to SR-52 is provided along Regents Road. The ultimate adopted Community Plan street classification for Regents Road is a 4-lane Major. The City BMP proposes Regents Road as a Class II (Bike Lane) or Class III (Bike Route) facility north of Governor Drive.

Torrey Pines Road functions as a two-way north-south, 4-lane Major Arterial with raised medians, bike lanes, and a curb to curb width of 60 feet. Torrey Pines Road is lined with sidewalks and curbs on both sides of the street for the entire length of the street. The ultimate adopted Community Plan does not include a street classification for Torrey Pines Road.

Towne Centre Drive functions as a two-way north-south, 4-lane Major Arterial with raised medians and a curb to curb width of 80 feet. Towne Centre Drive is lined with sidewalks and curbs on both sides of the street. Parallel parking available on both sides of the street for the majority of the street. Towne Centre Drive between Executive Drive and La Jolla Village Drive has bike lanes with no parking on both sides of the street. The posted speed limit is 40 mph. The ultimate adopted Community Plan street classification for Towne Centre Drive has been reached. The City BMP proposes Towne Centre Drive as a Class II (Bike Lane) or Class III (Bike Route) facility.

Villa La Jolla Drive functions as a two-way north-south roadway. South of VA Medical Center, Villa La Jolla Drive is classified as a 4-lane Major Arterial with raised medians, a posted speed limit of 40 mph, parallel parking on both sides of the street, and a curb to curb width of 80 feet. North of the VA Medical Center, Regents Road is classified as a 2-lane Collector with no parking and a curb to curb width of 26 feet. Villa La Jolla Drive is lined with sidewalks and curbs on both sides of the street for the entire length of the street. The posted speed limit is 25 mph. The ultimate adopted Community Plan street classification for Villa La Jolla Drive has been reached.

FREEWAYS

Interstate 5 is a significant north-south interstate that traverses the United States from the Mexican border to the Canadian border through the states of California, Oregon, and Washington. Within California, I-5 connects the following major metropolitan areas: San Diego, Los Angeles, Sacramento, and the eastern portion of the San Francisco Bay Area. I-5 is located on the western half of the University community and has interchanges at Genesee Avenue, La Jolla Village Drive, Gilman Drive, and Nobel Drive.

Interstate 805 is largely contained within the San Diego metropolitan area. Termini are both located along Interstate 5, one near the Mexico border and the other near the Torrey Pines State Reserve and the University of California at San Diego. I-805 is located on the eastern half of the University community and has interchanges at La Jolla Village Drive/Miramar Road, Nobel Drive, and Governor Drive.

State Route 52 is an east-west state highway that connects La Jolla on the west end at the termini with I-5 within Santee on the east end. SR-52 is located on the south side of the University community and has interchanges at interstate at Regents Road and Genesee Avenue.

TRAFFIC VOLUMES

Most of the peak-hour intersection turning movements and roadway segment traffic data were obtained in May of 2015 as part of the data collection process for this project. Three intersections along Nobel Drive had data collected in November 2015. The existing traffic volume data is contained in **Appendix E**.

INTERSECTION ANALYSIS

Peak-hour LOS analyses were performed for the morning (AM) and afternoon (PM) peak hour at each of the intersections within the study area. A midday peak hour was also evaluated at intersections along Genesee Avenue, La Jolla Village Drive, Nobel Drive, and Regents Road. The analyses represent the one-hour timeframe that experiences the highest total intersection volume at each individual location.

The following locations have coordinated signal timing plans for the listed time of day;

- Genesee Avenue - All Intersections (AM, Midday, PM)
- La Jolla Village Drive - All Intersections (AM, Midday, PM)
- Miramar Road - Miramar Mall, Miramar Place and Camino Santa Fe (AM, Midday, PM)
- Regents Road - Regents Park Row (AM)
- Regents Road - Nobel Drive (AM, PM)
- Regents Road - Luna Avenue (AM, Midday, PM)
- Regents Road - Plaza De Palmas (PM)
- Nobel Drive - Costa Verde Boulevard, Caminito Plaza Centro, (AM, Midday, PM)
- Nobel Drive - I-5 Ramps (Midday, PM)
- N. Torrey Pines Road - Pangea Drive, UCSD Northpoint Driveway (AM, PM)
- N. Torrey Pines Road - La Jolla Shores Drive (PM)
- Gilman Drive - Villa La Jolla Drive (AM, PM)

Table 4-1 presents the LOS analysis results for the study intersections. **Figures 4-5** through **4-7** illustrate the morning, midday and afternoon peak-hour LOS results for each of the study area intersections.

As shown in the results,

- Genesee Avenue experiences poor LOS around the I-5 interchange and south of Nobel Drive to the SR-52 interchange during both the AM and PM peak periods;
- La Jolla Village Drive experiences poor LOS at the intersection of Villa La Jolla Drive and between Regents Road and the I-805 interchange during both the AM and PM peak periods;
- Miramar Road experiences poor LOS during the PM peak periods;
- Nobel Drive experiences some delay but maintains acceptable LOS;
- Regents Road experiences poor LOS at the SR-52 interchange during both the AM and PM peak periods;
- Gilman Drive experiences poor LOS at the I-5 interchange during the PM peak hour; and
- Governor Drive experiences poor LOS at the I-805 Northbound ramps during the PM peak hour.

Table 4-1 Existing Conditions Summary of Intersection Analysis

Notes:

Bold values indicate intersections operating at LOS E or F.
ECL = Exceeds Calculable Limit. Reported when delay exceeds 180 seconds.

(a) Delay refers to the average control delay for the entire intersection, measured in seconds per vehicle. At a two-way stop-controlled intersection, delay refers to the worst movement.
(b) LOS calculations are based on the methodology outlined in the *2000 Highway Capacity Manual* and performed using Synchro 9.0

Notes:

Bold values indicate intersections operating at LOS E or F.

ECL = Exceeds Calculable Limit. Reported when delay exceeds 180 seconds.

SSSC = Side Street Stop Control

(a) Delay refers to the average control delay for the entire intersection, measured in seconds per vehicle. At a two-way stop-controlled intersection, delay refers to the worst movement.

(b) LOS calculations are based on the methodology outlined in the *2000 Highway Capacity Manual* and performed using Synchro 9.0

ROADWAY SEGMENT ADT BASED ANALYSIS

Each roadway segment in the study area was evaluated by comparing the daily traffic volume with the roadway's theoretical capacity based on its classification. The capacity represents the maximum daily volume before the roadway is expected to begin to operate at a LOS E. This volume-to-capacity comparison (v/c ratio) is a planning tool used to determine the general traffic demand on a segment and its sensitivity to delays.

Table 4-2 presents the results of the roadway segment analysis for a typical weekday. As shown in the table, it is estimated that all roadway segments function at an acceptable LOS D or better in the study area, except for the following segments.

- Eastgate Mall – between Judicial Drive and Eastgate Drive
  - 2-lane Collector, Freeway Overpass (LOS F)
- Eastgate Mall – between Eastgate Drive and Miramar Road
  - 2-lane Collector (LOS E)
- Genesee Avenue – between I-5 SB Ramps and I-5 NB Ramps
  - 6-lane Prime Arterial (LOS F)
- La Jolla Village Drive – between Villa La Jolla Drive and I-5 SB Ramps
  - 6-lane Prime Arterial (LOS F)
- La Jolla Village Drive – between I-5 SB Ramps and I-5 NB Ramps
  - 6-lane Major Arterial (LOS F)
- La Jolla Village Drive – between Genesee Avenue and Towne Centre Drive
  - 6-lane Major Arterial (LOS E)
- La Jolla Village Drive – between Towne Centre Drive and I-805 SB Ramps
  - 7-lane Major Arterial (LOS F)
- Miramar Road – between I-805 SB Ramps and I-805 NB Ramps
  - 6-lane Major Arterial (LOS F)
- Miramar Road – between Eastgate Mall and Camino Santa Fe
  - 6-lane Prime Arterial (LOS F)

Figure 4-8 illustrates the existing LOS results for each of the roadway segments in the study area based on the volume-to-capacity analysis methodology. The segments with LOS E or F have volumes above their theoretical capacity, typically resulting in periods of congestion.

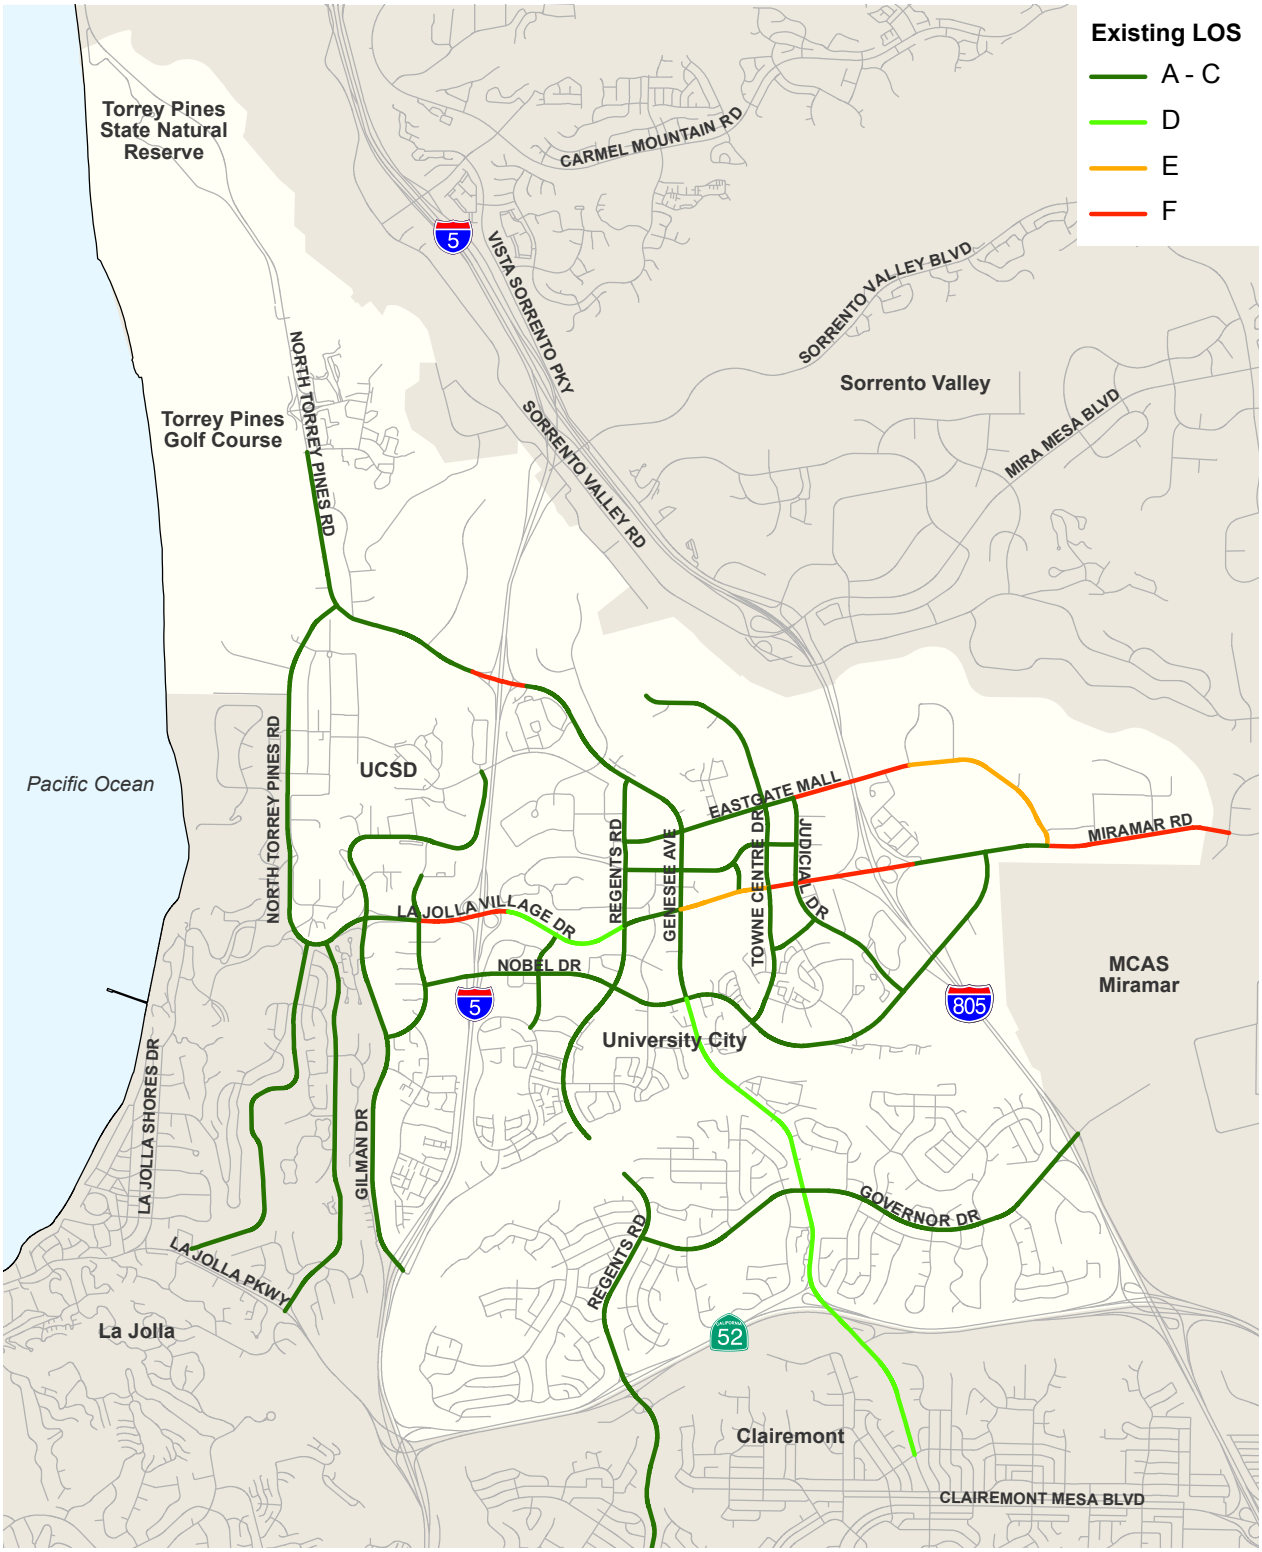
FIGURE 4-8



Existing Average Daily Traffic Level of Service Summary

CORRIDOR SPEED BASED ANALYSIS

A speed-based travel time analysis of key corridors within the University community was conducted during peak hours of the day. This analysis evaluates the roadway segment LOS perceived by auto users based on the average speed a vehicle maintains along the corridor. The following corridors were evaluated:

- Genesee Avenue (Lehrer Drive to North Torrey Pines Road)
- La Jolla Village Drive (Torrey Pines Road to Camino Santa Fe)
- Nobel Drive (La Jolla Village Square to Miramar Road)
- Regents Road (Genesee Avenue to Arriba Street, and Governor Drive to Luna Avenue)

The travel time information along each corridor was calculated using Synchro software and actual travel time information. A comparison of the two methods is provided to depict how well the simulation reflects actual travel times. This comparison is helpful in determining the accuracy of future travel time simulations. In general, the simulated travel times were longer than observed travel times because the simulation uses average approach delay, which does not account for the timed signal progression that occurs in the community. Also, the observed travel times represent an average time of several runs within a 2-hour timeframe, while the simulation uses the highest 1-hour volume at each intersection. Based on this comparison, the future travel time simulations compared to existing travel time simulations should show an accurate representation of change in delay, but would be expected to show a higher travel time than what would truly be experienced.

A summary of speed-based LOS along all four corridors are presented at the end of the section in **Figures 4-9** through **4-11**.

Genesee Avenue

The Genesee Avenue corridor is approximately 4.5 miles and goes through 18 traffic signals. The average speed along Genesee between North Torrey Pines Road and Lehrer Drive is estimated to be about 20 miles per hour during both peak periods and in both directions. Below 20 mph is equivalent to a LOS E. **Table 4-3** summarizes the total travel time, average speed, and resulting LOS for traveling from one end of the community to the other on Genesee Avenue.

In the morning peak, congestion is shown near Executive Square, new Campus Point Drive, and at the I-5 ramps. In the afternoon peak, congestion occurs consistently from Decoro Street to Eastgate Mall.

It should be noted that the interchange at I-5 was under construction at the time of these travel times for interchange improvements that will ultimately improve operations in that vicinity. However, the construction did not significantly affect the travel time runs.

La Jolla Village Drive/Miramar Road

The La Jolla Village Drive corridor is approximately 4.2 miles and goes through 17 traffic signals. The travel times were found to be faster than the estimated simulation times. **Table 4-4** summarizes the total travel time, average speed, and resulting LOS for traveling from one end of the community to the other on La Jolla Village Drive.

In the morning peak, the average speed along La Jolla Village Drive/Miramar Road is estimated to be around 20 miles per hour in the eastbound direction and less than 15 miles per hour in the westbound direction. The westbound direction has major congestion between the I-805 ramps and Genesee Avenue, and again near the I-5 ramps. The eastbound direction has noticeable congestion between the I-5 ramps and Genesee Avenue

In the afternoon peak, the average speed along La Jolla Village Drive/Miramar Road is estimated in the simulation to be about 12 miles per hour in the eastbound direction and 17 miles per hour in the westbound direction. The travel times showed an average speed of just under 30 miles per hour in both directions. Congestion at a couple key intersections significantly reduce travel speeds on the corridor. In the eastbound direction, the Towne Centre Drive intersection shows extreme congestion; in the westbound direction, Miramar Mall shows extreme congestion.

Nobel Drive

The Nobel Drive corridor is approximately 3.0 miles and goes through 16 traffic signals. **Table 4-5** summarizes the total travel time, average speed, and resulting LOS for traveling from one end of the community to the other on Nobel Drive.

The average speed along Nobel Drive between La Jolla Village Square and Miramar Road is estimated to be about 20 miles per hour in the morning peak period and closer to 15 miles per hour during the afternoon peak. Below 20 mph is equivalent to a LOS E.

Congestion is shown near the I-5 interchange, Genesee Avenue, and the I-805 interchange during both peak periods. During the field-collected travel time runs there were additional delays and congestion along Nobel Drive during the midday peak, especially near the commercial areas near Villa La Jolla.

Regents Road

The northern section of the Regents Road corridor is approximately 1.5 miles and goes through 9 traffic signals. **Table 4-6** summarizes the total travel time, average speed, and resulting LOS for traveling on the northern side of Regents Road. The average speed along Regents Road between Arriba Street and Genesee Avenue is estimated to be about 15 miles per hour in both peak periods and both directions. Below 15 mph is equivalent to a LOS F.

The southern section of the Regents Road corridor is approximately 1.5 miles and goes through 3 traffic signals. **Table 4-7** summarizes the total travel time, average speed, and resulting LOS for traveling on the southern side of Regents Road. The average speed along Regents Road between Luna Avenue and Governor Drive is estimated to be about 40 miles per hour in the morning peak period in both directions and about 20 miles per hour in the afternoon peak in both directions.

Existing PM Roadway Segment Speed Based Level of Service Summary

FREEWAY SEGMENTS

Freeway volumes were obtained from Caltrans and reflect the latest Year 2013 volumes that had been collected at the time of this report. The freeways were evaluated using procedures for a freeway mainline as outlined in the HCM.

Table 4-8 displays the LOS analysis results for the freeway segments adjacent to the community during the morning and afternoon peak hours. As shown in the table, the freeway segments surrounding the University community operate with an LOS D or better for all segments except the following:

- Interstate 5 shows LOS E and F between SR-52 and Gilman Drive during the AM and PM peak, respectively. During the AM peak, the failing LOS appears in the northbound direction, in the PM peak the failing LOS appears in the southbound direction.
- Interstate 805 shows LOS E or F at each of the study segments in both peak periods. The failing LOS shows up in the northbound direction during the AM peak and in the southbound direction during the PM peak.
- State Route 52 shows LOS E for the segment between Genesee Avenue and I-805 during the AM peak and LOS F between the segments of Regents Road and I-805 during the PM peak. All failing segments are in the eastbound direction.

In general, the failing segments are those that move traffic towards the University community in the morning and away from the University community in the afternoon. **Figure 4-12** illustrates the LOS along the freeways during the morning peak. **Figure 4-13** illustrates the LOS along the freeways during the afternoon peak. **Appendix K** includes the "k" and "d" factors published by Caltrans that are included in the analysis.

FREEWAY ENTRANCE RAMPS

Freeway entrance ramps that currently have ramp meters installed and in operation were evaluated to determine the delay and queue associated with the ramp meters. Calculations were made using the peak hour demand at the entrance ramp and the current meter rate to quantify the number and frequency of vehicles that are processed through the meter. The excess demand not being processed is then quantified along with its respective queue length. Ramp volumes were obtained from the intersection turning movements collected in May 2015. Appendix K contains the ramp meter rates provided by Caltrans.

Table 4-9 displays the results of the freeway ramp meters in the study area. It should be noted that the I-5/Genesee Avenue interchange was under construction at the time of this study and ramp meters were removed and not operating. As shown in the table, the meter rate adequately controls the expected demand with delays resulting in less than 15 minutes, except at the following location:

- I-805 SB & Nobel Drive, PM peak (21 minute delay)

It is expected that delays over 15 minutes lead people to use an alternate route or choose to use the ramp during a different time period. The existing ramp meter rate at this location is 229 vehicles per hour per lane. If the ramp meter rate was adjusted to be 240 vehicles per hour per lane or more, then the delays would be reduced to less than 15-minutes.

Figure 4-12 illustrates that no freeway entrance ramps are over capacity during the morning peak. Figure 4-13 illustrates the following ramps that are over capacity during the afternoon peak:

- I-5 SB & Gilman Drive
- I-5 SB & La Jolla Village Drive (WB to SB)

- I-5 SB & La Jolla Village Drive (EB to SB)
- I-805 SB & Nobel Drive
- I-805 SB and Governor Drive

Field observations were made at each of the entrance ramp locations to evaluate whether calculation results were accurate. Where calculation results were not accurate, the meter rate used in the calculations was adjusted to reflect queue lengths from field observations.

Notes:

(a) Peak-hour volumes were estimated by applying the K and D factors to the published 2013 Caltrans AADT volumes.

(b) The speed was calculated from a base free-flow speed (BFFS) of 65 mph.

(c) The LOS for the respective freeway segments were based on the methodologies contained in Chapter 23 of the *2000 Highway Capacity Manual*.

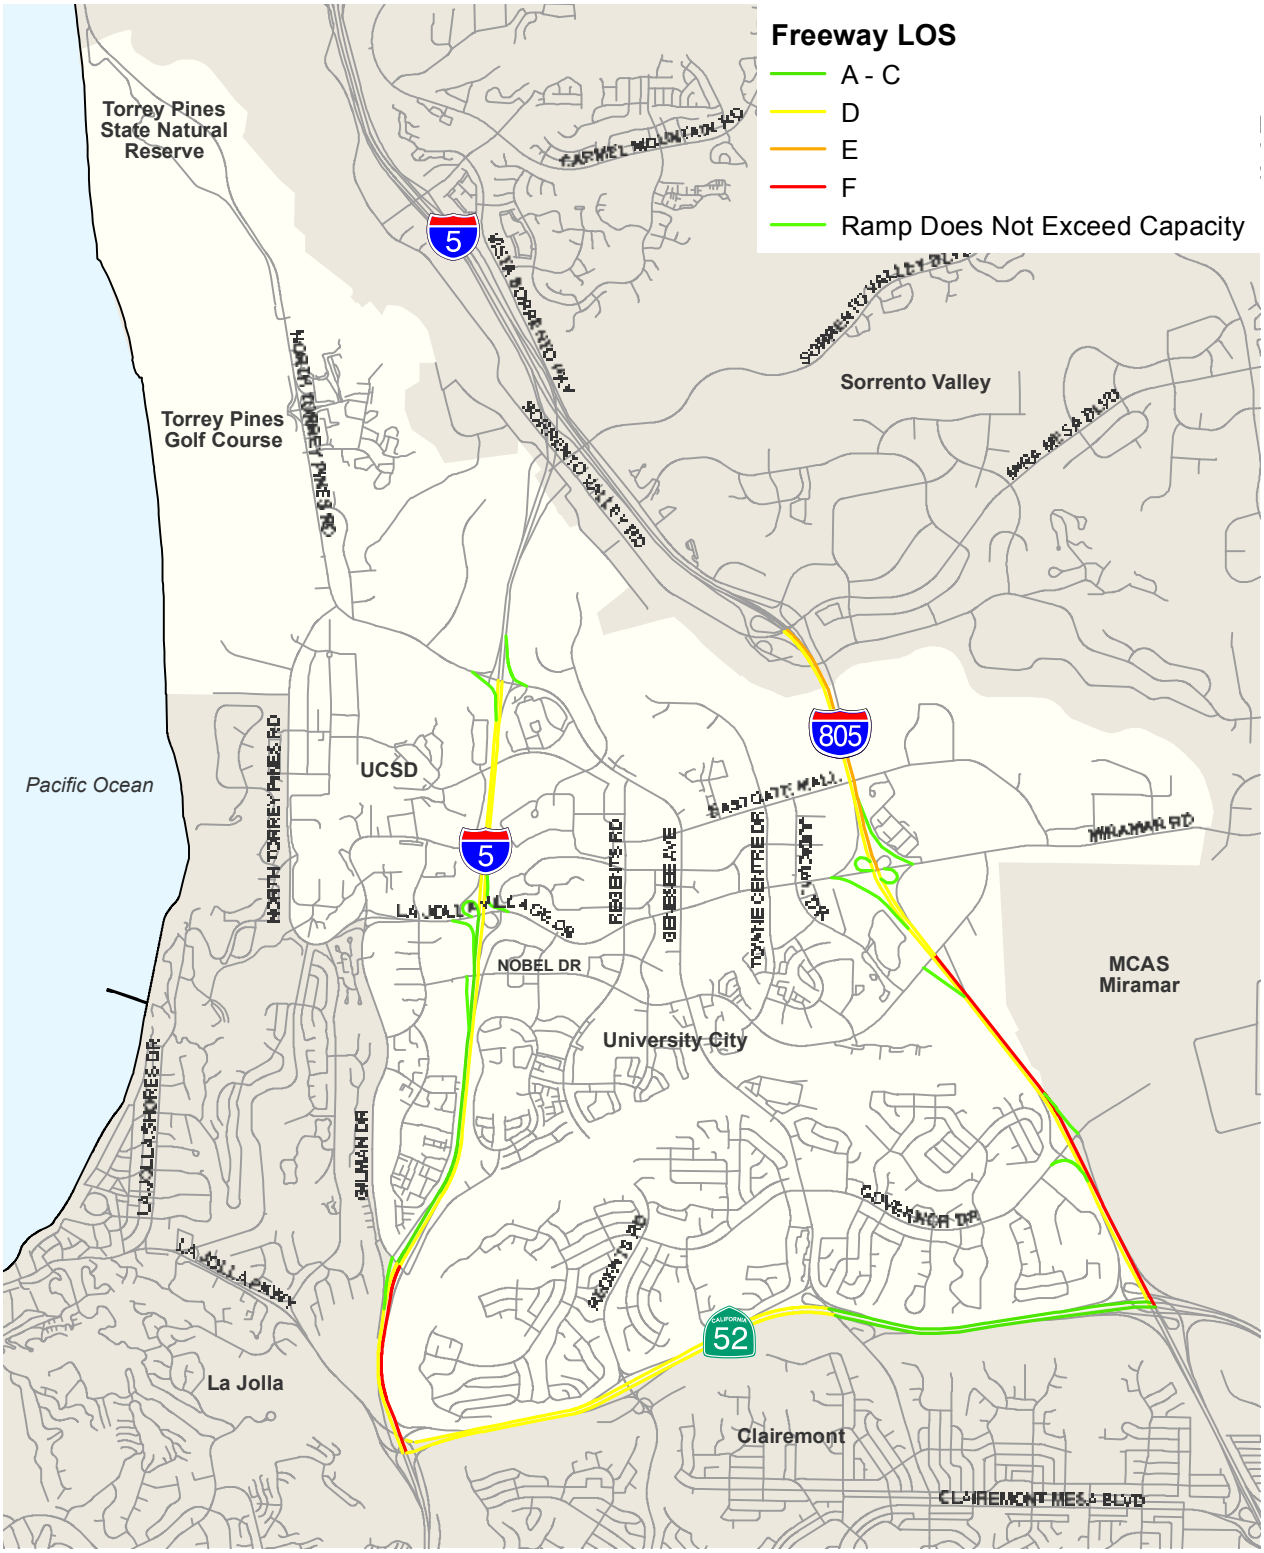
Notes:

(a) The ramp meter rate represents the most restrictive rate obtained from Caltrans. Cells that contain an "*" indicate meter rates that were manually adjusted to reflect queue lengths from field observations.

(b) A ramp meter rate ranging between 643 to 996 veh/hr/ln was provided by Caltrans, but field observations indicated that the ramp was not turned on.

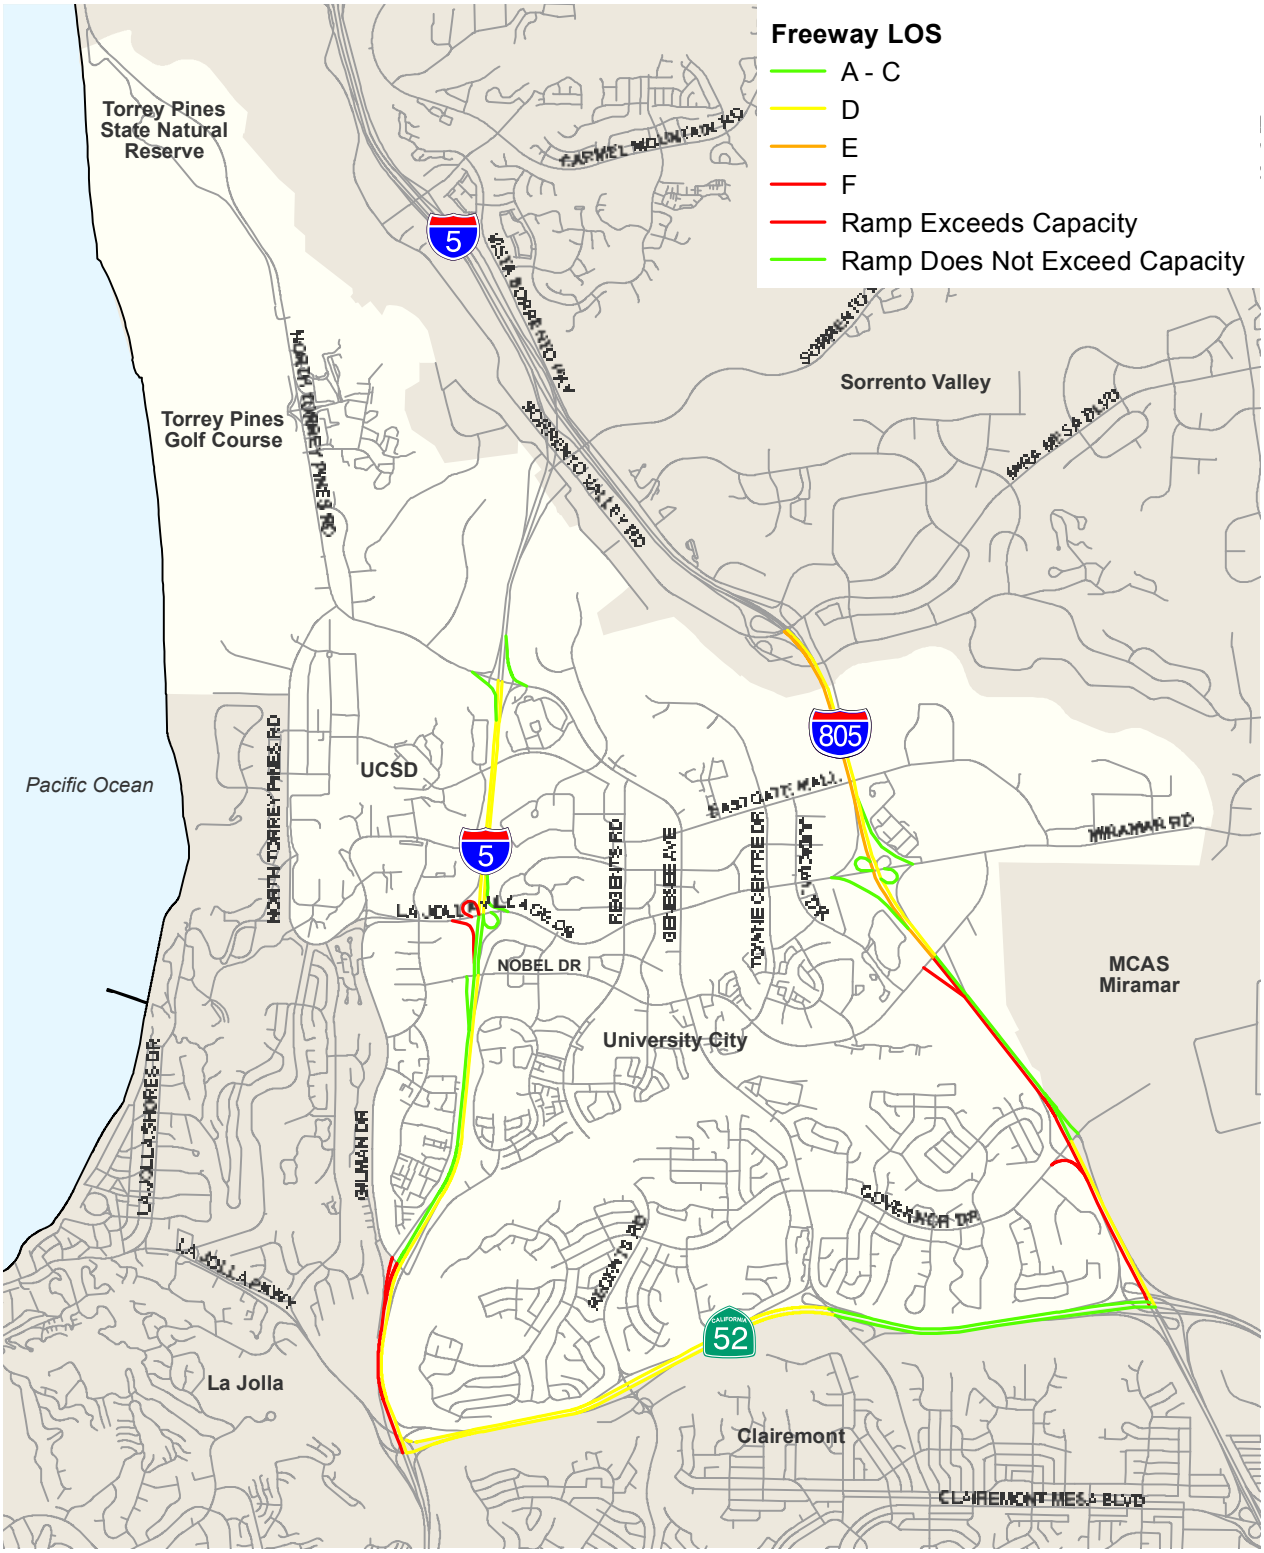
(c) Delays exceeding 15-minutes are shown in **bold** font.

FIGURE 4-12



Existing AM Freeway Operations Summary

FIGURE 4-13



Existing PM Freeway Operations Summary

5 ACTIVE TRANSPORTATION: WALKABLE COMMUNITY

SANDAG collects and maintains an inventory of the sidewalks within and adjacent to the University community. This information was used to create a baseline pedestrian network and to help determine existing pedestrian facilities versus missing facilities and connections within the community. The data is not all-inclusive, but has the necessary information to determine the adequacy of pedestrian connections. Figure 4-1 presented an overview of the pedestrian network inventory within the community. It is important to note that the sidewalk inventory available does not include private entities, such as the UCSD campus, nor separated trails, such as those within Rose Canyon.

FUTURE NETWORK CHANGES

There are no major changes to the pedestrian network planned for the University community. Site-specific improvements will need to be included as new development or redevelopment occurs. The City will continue to upgrade curb ramps and traffic signal operations as part of their ongoing maintenance and operations programs.

ACCESS TO TRANSIT

Each transit stop within the University community was evaluated for its accessibility through the sidewalk network. A 0.25-mile walkshed was calculated from each transit stop, allowing the simulated pedestrian to only utilize available sidewalks and crossings. The evaluation is purely distance based and does not have any factors related to time. **Figure 5-1** summarizes the results of the walkshed analysis performed for the existing transit network.

The northern and central areas within the community provide good pedestrian facilities to access transit. Most of the area is covered within a 0.25-mile walkshed. The southern part of the community is not well served, with only the areas very close to Governor Drive and Genesee Avenue having good pedestrian connections. Residential neighborhoods within the southwestern and southeastern areas of the “golden triangle” do not have public transit facilities located within a 0.25-mile walkshed.

The Mid-Coast trolley project would provide pedestrian connections to existing facilities at each transit station in the community.

COMMUNITY RECOMMENDATIONS

In general, sidewalks and curb ramps are provided along the majority of the roadways in the University community. The isolated sections of sidewalk that are missing are mostly constrained by bridge widths, do not have fronting property and are in a residential area where sidewalk is provided on the opposite side, or have special considerations. However, some segments such as Miramar Road between Eastgate Mall and Miramar Place and North Torrey Pines Road between Muir College Drive and Pangea Drive, among other sections of some residential streets, should be considered for the addition of sidewalk. Curb ramps throughout the community should continue to be implemented where they are not provided, and existing curb ramps should be updated to meet accessibility standards.

Crosswalks throughout the community should be upgraded to high-visibility crosswalks, such as continental (zebra) striping. With most roadways having high speeds and heavy volumes, additional crosswalk visibility would help notify drivers of an upcoming crosswalk and potential for pedestrian activity.

There are several schools located within the University community. The community would benefit from safe routes to school projects that improve pedestrian safety between residential areas and schools. Improved pedestrian access may reduce the number of vehicles driving to schools in the mornings and afternoons.

Pedestrian bridges are provided at certain locations within the community core retail area where pedestrian interactions between land uses separated by a roadway are frequent and traffic volumes on the roadway are especially high. These separated facilities improve the pedestrian experience as it removes pedestrians from potential conflict points with vehicles and eliminates wait times at signals. The planned Mid-Coast trolley stations will include raised platforms along Genesee Avenue that will provide access to the transit system and also act as a pedestrian crossing. Pedestrian facilities for each new trolley station will connect to the existing sidewalk network.

The new transit center planned at La Jolla Village Square is expected to be difficult to access from Nobel Drive with the current pedestrian crossing locations. It is recommended that a pedestrian facility is considered on the east side of the La Jolla Village Square parking lot, connecting to Nobel Drive at the intersection with the I-5 Southbound ramps. A pedestrian crossing could be provided on the west side of that signalized intersection to provide access to the retail shops on the north side of Nobel Drive. This would improve connectivity between the transit center and adjacent retail, as well as provide an alternative pedestrian access to La Jolla Village Square.

The pedestrian overcrossing located along La Jolla Village Drive just west of Villa La Jolla Drive has poor accessibility from either end, which limits its usefulness. It is recommended that a pedestrian trail is provided on the northern end of the overcrossing, providing a connection to the signalized intersection of Villa La Jolla Drive and VA Medical Center. This would encourage better use of the overcrossing for the VA and UCSD users north of La Jolla Village Drive and retail and residential uses south of La Jolla Village Drive.

There is a planned pedestrian overcrossing in the North University City (NUC) Public Facilities Financing Plan (PFFP) (NUC-1) that would be located on La Jolla Village Drive just west of Genesee Avenue. The location of that planned overcrossing is no longer a logical pedestrian connection. Originally, the overcrossing was planned to connect retail developments and be a part of a pedestrian bridge network that included another bridge crossing Genesee Avenue. The Genesee Avenue bridge crossing is being removed as part of the Mid-Coast Trolley project. As a result, the planned pedestrian overcrossing should be reconsidered. The Community Plan Amendment process will not be specifically addressing this issue and assessment of the removal of the bridge will be either studied by the development applicant or handled in the forthcoming Community Plan Update.

At the intersection of Torrey Pines Road and La Jolla Village Drive, it is recommended to move the pedestrian crossing from the east leg of the intersection to the west leg of the intersection. One of the heavy movements at this intersection is the northbound right-turn, which currently crosses the pedestrian pathway when they have a green light. Moving the pedestrian crossing to the other side of the intersection removes pedestrians from potential conflict points with vehicles when vehicles have a green light. Currently, the pedestrians cross at the same time that all northbound movements have a green light. Instead, the pedestrian crossing should be activated when the westbound left-turns and northbound right-turns have a green light, allowing pedestrians to cross concurrently with the northbound right-turns and be separated from the path of travel.

The Eastbound La Jolla Village Drive and Gilman Drive intersection is currently side-street stop-controlled. It has a short pedestrian crossing and curb ramps on the west side that provides an adequate crossing point. There is no pedestrian crossing and a free right-turn provided on the east side, with no sidewalk on the northeast corner. Pedestrians on the east side of Gilman Drive approaching this intersection are

required to go up to La Jolla Village Drive as no other pedestrian crossing option is provided. The recommended traffic signal at this intersection would allow for pedestrians on the east side to cross Gilman Drive to get to the sidewalk available on the west side. It would also provide additional attention to pedestrian crossing on the west side with a striped crosswalk and signal- controlled movements.

At the intersection of Genesee Avenue and SR-52 Westbound ramps, the sidewalk on the west side of Genesee Avenue ends just prior to the free right-turn from Genesee Avenue to westbound SR-52. No pedestrian crossing or facility is provided from that point south until Luna Avenue. The recommended traffic signal at this location would provide a location for pedestrians on the west side to cross to the east side of Genesee Avenue to utilize the existing sidewalk. Further, the recommended reconfiguration of the ramps would remove the southbound to westbound free right-turn movement which is a hazard for pedestrians.

Alternatives A and B

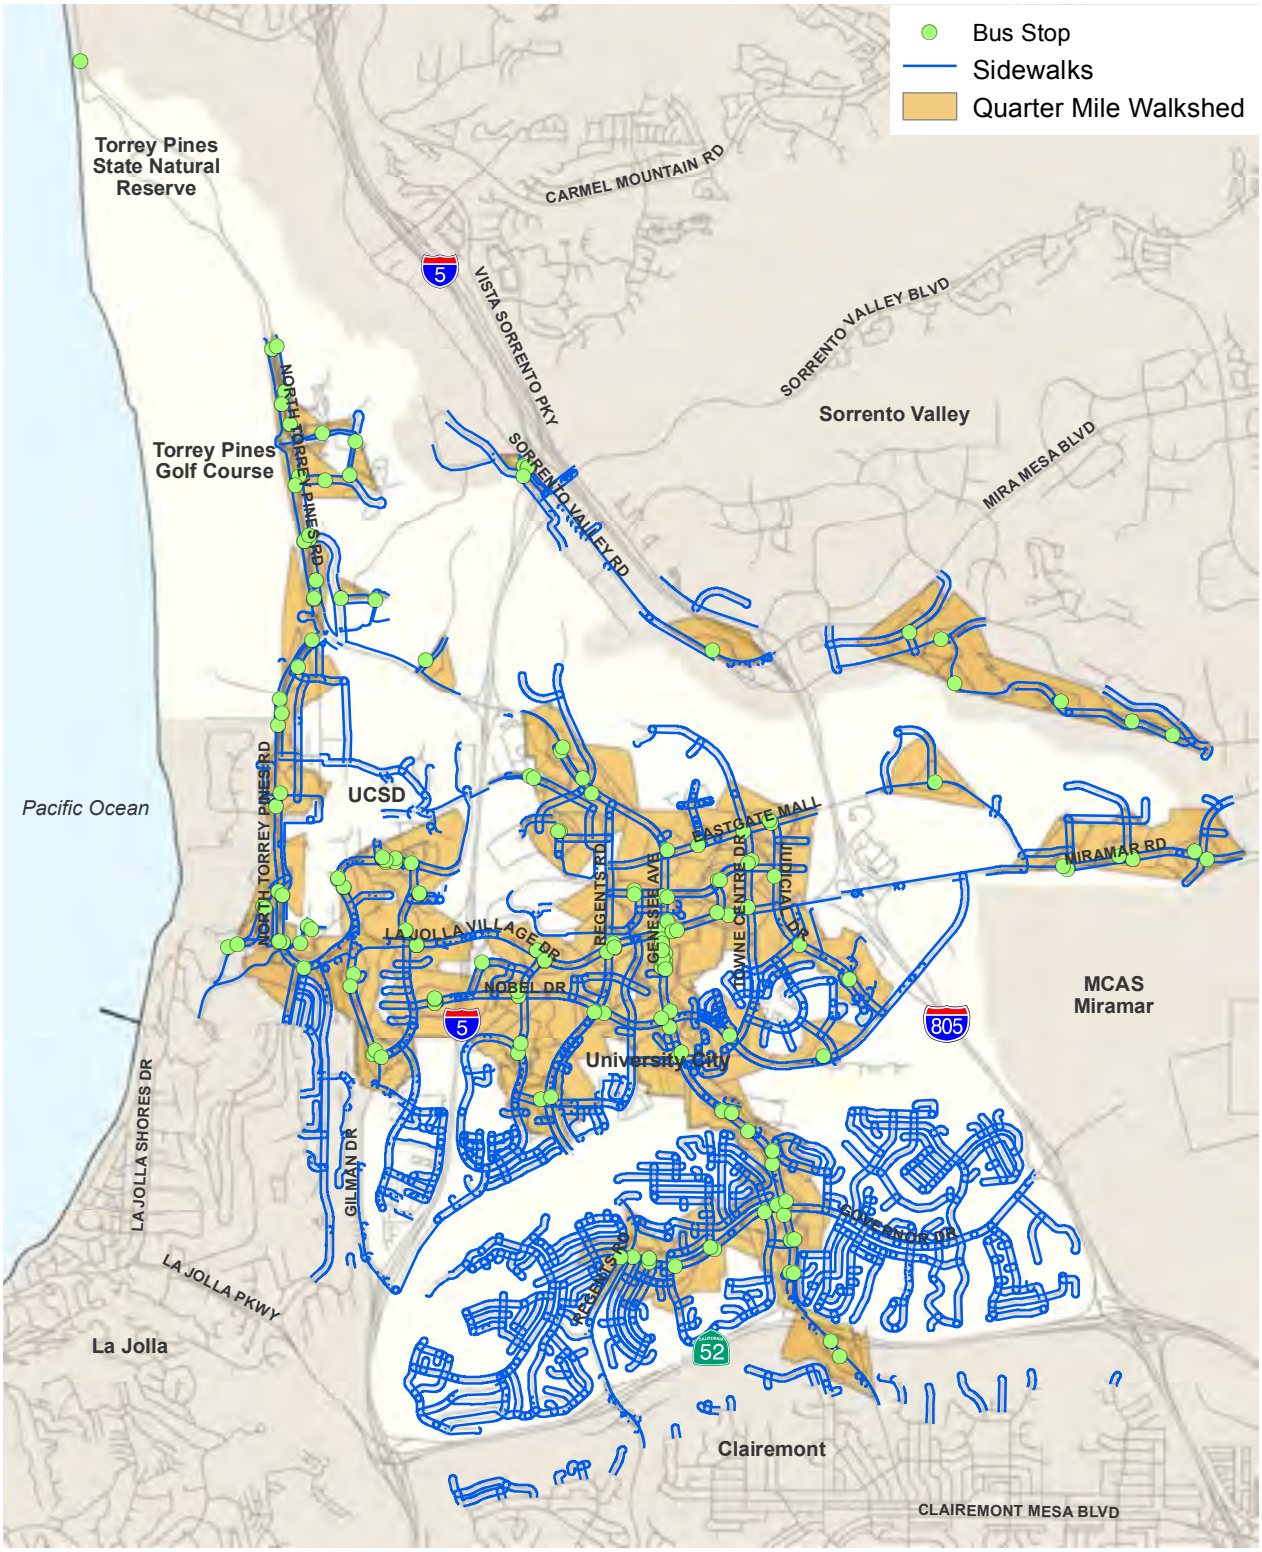
With implementation of Alternatives A and B, the Regents Road bridge would create a new pedestrian crossing over Rose Canyon. The bridge structure is approximately a quarter mile in length. There are retail uses north of the bridge at the northwest corner of Regents Road and Arriba Street and south of the bridge at the northeast corner of Regents Road and Governor Drive. It is anticipated that the bridge would have less than moderate use and would not be a key pedestrian connection for the community.

Regardless of the alternative, pedestrian facilities would continue to be provided along Genesee Avenue across Rose Canyon.

Alternatives C and D

With implementation of Alternatives C and D, the Regents Road bridge would not be built and there would be no change to the existing pedestrian network at or near Rose Canyon. Regardless of the alternative, pedestrian facilities would continue to be provided along Genesee Avenue across Rose Canyon.

FIGURE 5-1



Transit Walkshed Analysis Summary

6 ACTIVE TRANSPORTATION: BICYCLING

The City of San Diego has developed a network of designated Class I, II, and III bikeways as part of their Bicycle Master Plan efforts. A Class I facility is a bike path that provides for bicycles to travel on a paved right-of-way completely separated from any street or highway. A Class II facility is a bike lane that provides bicycles an exclusive or semi-exclusive lane of travel on a roadway separated by a painted line. A Class III facility is a bike route that provides for a shared use with pedestrian or motor vehicle traffic and is only identified by signage and/or pavement markings. **Table 6-1** provides more description and illustrates the types of bikeway identified in the City of San Diego Bicycle Master Plan (BMP).

Table 6-1 Regional Bicycle Facility Classifications

Class I – Bike Path Bike paths are bikeways that are physically separated from vehicular traffic. Also termed shared-use paths, bike paths accommodate bicycle, pedestrian, and other non-motorized travel. Paths can be constructed in roadway right-of-way or independent right-of-way. Bike paths provide critical connections in the region where roadways are absent or are not conducive to bicycle travel.	Class II - Bike Lanes Bike lanes are defined by pavement markings and signage used to allocate a portion of a roadway for exclusive or preferential bicycle travel. Within the regional corridor system, bike lanes should be enhanced with treatments that improve safety and connectivity by addressing site-specific issues. Such treatments include innovative signage, intersection treatments, and bicycle loop detectors.	Class III - Bike Routes Bike routes are located on shared roadways that accommodate vehicles and bicycles in the same travel lane. Established by signs, bike routes provide continuity to other bike facilities or designate preferred routes through corridors with high demand. Within the regional corridor system, bike routes should be enhanced with treatments that improve safety and connectivity by addressing site-specific issues.	

Source: *SANDAG Regional Bicycle Plan*, dated April 2010 (ALTA Planning)

Two additional bicycle facilities, Cycle Track (referred to as a Class IV Bicycle Lane by the City of San Diego) and Bicycle Boulevard, have been adopted into the SANDAG Regional Bike Plan (RBP). A Class IV Bicycle Lane is a bicycle facility that is located within the roadway right-of-way but essentially functions as a separated facility. Bicycle Boulevards are roadways where physical improvements such as traffic calming and diversions are intended to provide priority to bicyclists. Bicycle Boulevards are typically installed on local roads with a low volume of vehicles. **Table 6-2** further explains the two new bicycle facilities.

Table 6-2 Additional Bicycle Facility Classifications

Cycle Tracks A cycle track is a hybrid type bicycle facility that combines the experience of a separated path with the on-street infrastructure of a conventional bike lane. Cycle tracks are bikeways located in roadway right-of-way but separated from vehicle lanes by physical barriers or buffers. Cycle tracks provide for one-way bicycle travel in each direction adjacent to vehicular travel lanes and are exclusively for bicycle use. Cycle tracks are not recognized by Caltrans Highway Design Manual as a bikeway facility. Development of cycle track on segments of the regional corridor system is proposed through experimental, pilot projects.	Bicycle Boulevards Bicycle boulevards are local roads or residential streets that have been enhanced with traffic calming and other treatments to facilitate safe and convenient bicycle travel. Bicycle boulevards accommodate bicyclists and motorists in the same travel lanes, typically without specific vehicle or bicycle lane delineation. These roadway designations prioritize bicycle travel above vehicular travel. The treatments applied to create a bike boulevard heighten motorists' awareness of bicyclists and slow vehicle traffic, making the boulevard more conducive to safe bicycle and pedestrian activity. Bicycle boulevard treatments include signage, pavement markings, intersection treatments, traffic calming measures and can include traffic diversions. Bicycle boulevards are not defined as bikeways by Caltrans Highway Design Manual; however, the basic design features of bicycle boulevards comply with Caltrans standards.	
Source: *SANDAG Regional Bicycle Plan*, dated April 2010 (ALTA Planning)

FUTURE NETWORK CHANGES

The following table summarizes improvements to the bicycle network in the University community that are recommended as part of this Community Plan Amendment. These recommendations would be the same for each of the four alternatives.

Table 6-3 Recommended Bicycle Improvements

	Improvement	Facility Classification	Corridors	Funding
1	**I-5 Bicycle Path** - Caltrans is constructing a bicycle path connecting Roselle Street with Voigt Drive. This path will include an active transportation bridge over Genesee Avenue. The existing bicycle lanes allowed on the shoulders of I-5 between Genesee Avenue and Roselle Street would be removed due to this facility upgrade.	1	I-5/UCSD	Caltrans
2	**I-5 Bicycle Path Extension to Gilman Bridge** - UCSD will extend the bicycle path along I-5 from Voigt Road to Gilman Drive bridge. The length of this segment is 0.4 miles.	1	I-5/UCSD	UCSD
3	**Rose Canyon/San Clemente Canyon Connections** - Provide a path connecting Rose Canyon, San Clemente Canyon and South University (at Blothe Avenue). These connections will require a bridge to cross the railroad tracks. The length of this segment within the community is 0.3 miles.	1	Coastal Trail I-5/UCSD Rose Canyon	FBA
4	**Marian Bear Trail** - construct a trail along existing dirt trail connecting Standley Recreation Center with San Clemente Trail. This improvement should be completed when San Clemente Trail is improved to a Class 1 facility. The length of this segment is 0.5 miles.	1	none	FBA
5	**Executive Drive** - Designate bicycle lanes from Judicial Drive to Nobel Road/Miramar Street by narrowing travel lanes and removing parking. This segment is 0.8 miles in length.	2	Executive	FBA
6	**Judicial Drive** - Provide bicycle lanes between Executive Drive and Eastgate Mall by narrowing travel lanes and removing parking. This segment is 0.2 miles.	2	Judicial	FBA
7	**Via La Jolla** - Construct bicycle lanes from Gilman Drive to La Jolla Village Drive. The length of this segment is 0.6 miles.	2	none	FBA
8	**Gilman Drive (UCSD Segment)** - This project would construct a bridge over I-5 with bicycle lanes. Additionally, UCSD has identified projects to upgrade facilities on Gilman to bicycle lanes connecting to City facilities at La Jolla Village Drive.	2	UCSD	UCSD
9	**Voigt Drive (UCSD)** - Voigt Drive will be realigned to connect directly with the Genesee Avenue/Campus Point Drive intersection and its bridge over I-5 will be widened. Bicycle lanes will be provided.	2	UCSD	Mid Coast LRT

Table 6-3 Recommended Bicycle Improvements (continued)

	Improvement	Facility Classification	Corridors	Funding
10	**Blothe Avenue and Stressman Street Bicycle Route** - Designate all of Blothe Avenue and Stressman Street from Blothe Avenue to Governor Drive as a bicycle route connecting South University with bicycle paths on the fringe of the community. These segments are approximately 1 mile in length.	3	none	FBA
11	**Eastgate Mall** - Designate as a bicycle route between Genesee Avenue and Regents Road. Use traffic calming techniques to slow vehicular speeds for this segment which is adjacent to a park and school. This segment is 0.25 miles in length.	3	Eastgate Coastal Trail	FBA
12	**Governor Drive** - Designate as a protected bicycle lane within the existing right-of-way. In areas where space is limited, designate as bicycle lanes. This segment is 2.6 miles long.	4	Governor	FBA
13	**Nobel Drive** - Designate as protected bicycle lanes from Miramar Road to the I-5 northbound ramps. This improvement will require narrowing of travel lanes and removal of on-street parking. This segment is 3.1 miles in length.	4	Nobel	FBA & SANDAG
14	**Eastgate Mall** - Designate as protected bicycle lanes from Miramar Road to Genesee Avenue. This would accomplished through a combination of widen the roadway, narrowing travel lane widths, road diets, or parking removal. This segment is 1.85 miles in length.	4	Eastgate Coastal Trail	FBA
15	**Regents Road North** - Designate this segment as protected bicycle lanes from the southern terminus at Rose Canyon to Genesee Avenue. This segment would be improved through a combination of narrow travel lanes and parking removal. This segment is 1.7 miles in length.	4	Regents	FBA
16	**Regents Road South** - Designate this segment as protected bicycle lanes from the northern terminus of the road at Rose Canyon to the SR-52 eastbound ramps. This segment is 1.1 miles in length.	4	Regents	FBA
17	**Gilman Drive** - Construct protected bicycle lanes from the existing terminus of the Rose Canyon path at I-5/La Jolla Colony to La Jolla Village Drive (WB ramps). The protected lanes would be two-way and on the west side of Gilman Drive from I-5 to Evening Way, where the northbound lanes would cross at a new traffic signal. From Evening Way to La Jolla Village and the UCSD campus, the protected lanes would become one-way. The length of this segment is 1.7 miles.	4	I-5/UCSD	FBA

The following table summarizes additions to the bicycle network in the University community that are recommended for **only Alternatives A and B**:

Table 6-4 Additional Recommended Bicycle Improvements – Alternatives A and B

	Improvement	Facility Classification	Corridors	Funding
18	**Regents Road Bridge** - With completion of a bridge over Rose Canyon (for autos), construct protected bicycle lanes from the existing terminus of Regents Road north of the canyon to the existing terminus south of the canyon. This segment is approximately 0.3 miles in length.	4	Regents	FBA

The following table summarizes additions to the bicycle network in the University community that are recommended for **only Alternative C.**

Table 6-5 Additional Recommended Bicycle Improvements – Alternative C **and D**

	Improvement	Facility Classification	Corridors	Funding
19	**Regents Road Bridge** – Construct an active transportation bridge that would be used only by bicycles, pedestrians, and emergency vehicles from the existing terminus of Regents Road north of the canyon to the existing terminus south of the canyon. This segment is approximately 0.3 miles in length.	1	Genesee	FBA

The following table shows an addition to the bicycle network in the University community that is recommended for **only Alternatives B and C**:

Table 6-6 Additional Recommended Bicycle Improvements – Alternatives B and C

	Improvement	Facility Classification	Corridors	Funding
20	**Genesee Avenue** – Construct a shared-use trail adjacent to the travel lanes between Nobel Drive and SR-52 WB ramps. The existing sidewalks would be widening to 12 feet in width to accommodate both pedestrians and bicyclists. This segment is 1.35 miles in length.	1	Genesee	FBA

The following table summarizes improvements that are not included in the community plan, but are depicted in San Diego Association of Government's Bicycle Master Plan.

Table 6-7 Additional Bicycle Improvements – SANDAG

Improvement		Facility Classification	Corridors	Funding
21	**Rose Canyon Bicycle Path** - Extend from the existing trail at I-5/La Jolla Colony to Nobel Drive, generally following dirt paths on the north side of the railroad tracks. Provide connections to Nobel Drive and Genesee Avenue. Total length of the segment is 2.4 miles.	1	Coastal Trail	SANDAG
22	**Roselle Canyon Bicycle Path** - Construct a trail along existing dirt path connecting Eastgate Mall and Roselle Street. Path is 1.4 miles in length.	1	Coastal Trail	SANDAG

The resulting bicycle network maps are provided in **Appendices A – D**.

BICYCLE LEVEL OF TRAFFIC STRESS

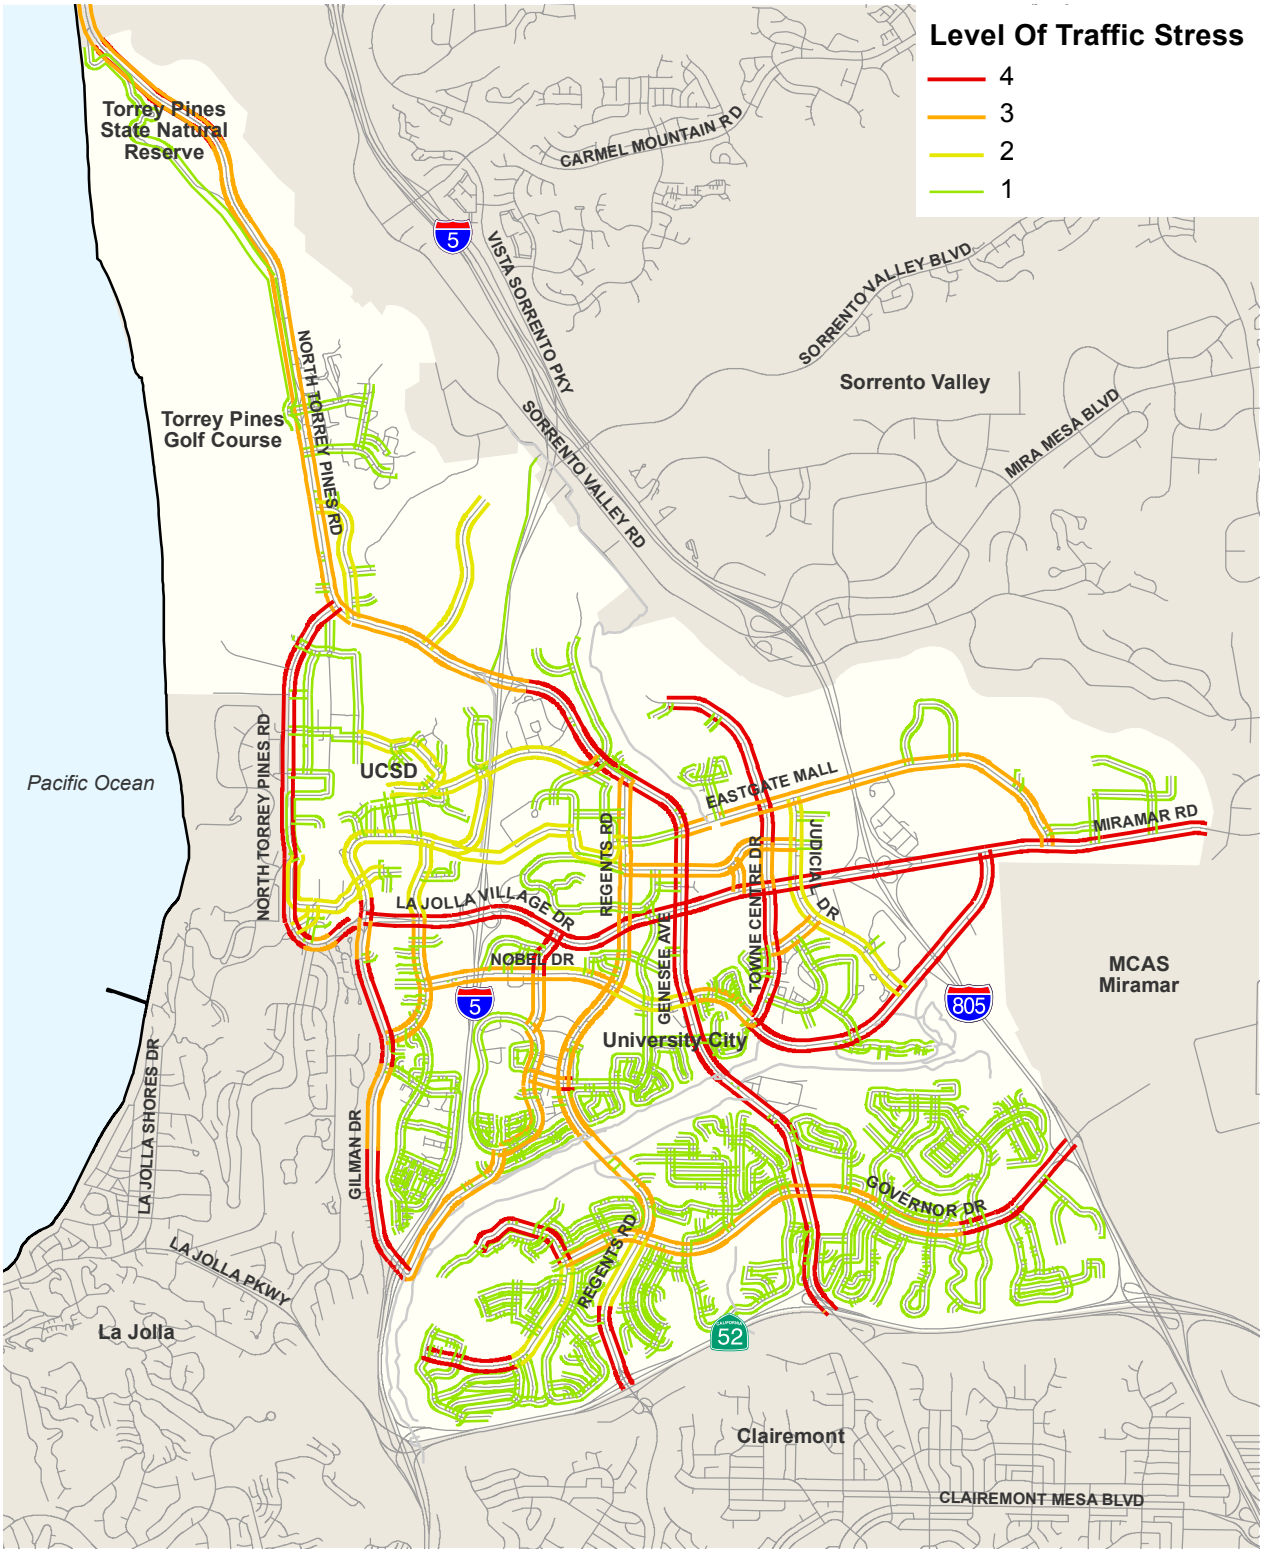
The Bicycle Level of Traffic Stress (BLTS) analysis was completed to summarize the biking conditions in the community. **Figure 6-1** summarizes the LTS score for each direction of roadway segments throughout the community with the recommended improvements in place. The results would not change between alternatives except for the area where the Regents Road bridge would be. Without the bridge, there would not be a bicycle facility, nor an associated LTS score for the segment.

With the completed bicycle network in the community, the BLTS is reduced along the corridors where there is an investment in bicycle facilities. These corridors include Eastgate Mall, Nobel Drive, Regents Road, Governor Drive, and the I-5 freeway. The BLTS methodology allows for moderate improvements in score with buffered or separated bicycle facilities, but has limits to how much the stress level can change since speed and number of lanes play a factor in the analysis and remain unchanged on several roadways. The proposed bicycle network includes several separated facilities that would provide bicyclists increased comfort that is not reflected in the BLTS scoring.

ADDITIONAL RECOMMENDATIONS

The effectiveness of bicycle facilities is a combination of the facility provided along the side of the road and its continuity through each intersection. The recommended facilities along the roadways are described in the previous section. To address safety concerns for bicycles at intersections, it is recommended that signals along Class II and IV facilities include detection for bicyclists and consideration of additional improvements such as bicycle boxes, no right-turn-on-red restrictions for vehicles, and bicycle signal head indications.

FIGURE 6-1



Completed Network Bicycle Level of Traffic Stress
Alternatives A & B

7 FUTURE YEAR VEHICLE NETWORK

This chapter discusses the vehicle network analyses and variations in results between the different network alternatives being considered.

FUTURE YEAR VOLUME FORECASTS

LAND USE ASSUMPTIONS

The adopted community land use was considered in this study. The land use assumptions for future conditions were consistent across each Alternative. **Table 7-1** shows the land use and trip generation comparison between base year 2008 and the adopted community plan. An estimated 271,502 new trips are planned for the community. The origin and destination assumptions associated with trips generated by these land uses was set constant for each of the alternatives. This determination was made to be able to understand the change in patterns between alternatives solely based on the available network change, and not mixed with network and user mode-choice and origin-destination decision changes.

MODEL CALIBRATION PROCESS

A traffic model was prepared by SANDAG for existing and future community build-out conditions. Traffic counts obtained in May of 2015 were used to calibrate the existing model results. Using the attributes included in the calibrated existing model, the future adopted land use assumptions including community plan amendments currently under review, initiated community plan amendments, and proposed roadway network variations were input and run to estimate future volumes. Based on the existing calibration exercise and the future volume projections, several post-model adjustments were made. Details of the adjustments are provided in **Appendix F**. Adjustments were typically required when the model-to-volume comparison was greater than 10%. The existing model did not have the Judicial Drive connection that exists and was present when traffic counts were obtained in 2015 and was included in the future models, so some locations greater than 10% were not adjusted due to the change in traffic patterns associated with this connection. The same post-model adjustments were made to each alternative except on Regents Road where volume adjustments were needed for the no bridge.

The model data provides roadway and freeway volumes, and was not used for intersection volumes. Future peak hour turning movements at the study area intersections were developed using methodologies from National Cooperative Highway Research Program (NCHRP) 255 – Highway Traffic Data for Urbanized Area Project Planning and Design, Chapter 8. NCHRP Report 255 is a compilation of the best techniques that are currently being used in urban areas to forecast future traffic volumes. These techniques were identified through a survey of state and local agencies with follow-up field visits to obtain detailed information on procedural steps and typical applications. The method used to forecast the future turning movement volumes evaluation is the NCHRP's "Directional Volume Forecast". For this method, existing and future daily traffic volumes, existing peak hour turning movements, and projected peak hour "K" and directional "D" factors are used to calculate future year turning movements. Existing daily segment traffic volumes and peak hour intersection turning movements were counted in the field. Future daily traffic volumes were obtained from the forecast model forecast. Using the "Directional Volume Forecast" technique, the existing turning movements at each study area intersection were factored based on increases in daily approach traffic and existing K and D factors. Each respective movement was derived using an iterative approach that balances the inflows and outflows for each approach. The supporting worksheets for calculating future volumes and the resulting peak hour intersection turning movement volumes are included in **Appendices A - F**.

Table 7-1 Community Trip Generation Changes between Existing and Future Year Build-out

SUMMARY OF PLANNED PROJECTS

The following projects are included in the North University City (NUC) Public Facilities Financing Plan (FFP) and were included in the network for each alternative:

- (NUC-13) Regents Road between Genesee Avenue and Eastgate Mall changed from 2-lane Collector (continuous left-turn lane) to a 4-lane Major Arterial
- (NUC-24) Genesee Avenue between I-5 SB Ramps and I-5 NB Ramps changed from a 4-lane Major Arterial to a 8-lane Prime Arterial
- (NUC-50) Miramar Road between Eastgate Mall and Miramar Mall changed from a 6-lane Prime Arterial to a 7-lane Prime Arterial
- Genesee Avenue between La Jolla Village Drive and Esplanade Court changed from a 4-lane Major Arterial to a 6-lane Major Arterial (temporarily 4-lane Major Arterial until completion of transit projects)

In addition to the above, the following roadway changes take place depending on the alternative:

Alternative A

- (NUC-A) Genesee Avenue from Nobel Drive to SR-52 WB Ramps changed from a 4-lane Major Arterial to a modified 6-lane Major Arterial
- (NUC-18) Regents Road Bridge spanning Rose Canyon
- (NUC-18) Regents Road between Rose Canyon and Governor Drive changed from a 2-lane Collector (no fronting property) to a 4-lane Collector

Alternative B

- (NUC-18) Regents Road Bridge spanning Rose Canyon
- (NUC-18) Regents Road between Rose Canyon and Governor Drive changed from a 2-lane Collector (no fronting property) to a 4-lane Collector

Alternative C

- (NUC-A) Genesee Avenue from Nobel Drive to SR-52 WB Ramps changed from a 4-lane Major Arterial to a modified 6-lane Major Arterial

The resulting network geometry at each individual intersection is illustrated in **Figures 7-1 through 7-5**.

Planned Future Intersection Geometry: Variations by Alternative

TRAVEL PATTERNS BY ALTERNATIVE

Alternative D represents a network that is similar to what currently exists with the planned network changes described above. As such, travel patterns would remain similar.

Figure 7-6 illustrates the origins and destinations north and south of Rose Canyon that utilize the Genesee Avenue bridge crossing under Alternative D. Every trip across the canyon has an origin on one side of the canyon and destination on the other side. As such, the total of all origins and destinations north of the canyon equals 100% and the total of all origins and destinations south of the canyon equals 100%. On the north side of the canyon, the majority (87%) of people are utilizing North University area, with about 10% expected to be in the UCSD footprint and about 3% traveling outside of the community to the east. On the south side of the canyon, about 44% are utilizing the South University community, about 41% are traveling between Clairemont, 14% are freeway traffic, and the remaining 1% travel between La Jolla.

Each of the other three alternatives were compared to Alternative D to determine how travel patterns would change in response to changes in the network.

Alternative A

Figure 7-7 illustrates the changes that occur with the implementation of Alternative A. Regents Road would experience increased volumes from one end of the community to the other. Lebon Drive would experience increased traffic as it acts as an alternative route to get between Regents Road and La Jolla Village Drive. La Jolla Village Drive and Nobel Drive would experience some decreased volumes as people utilize Regents Road and Genesee Avenue to travel through the community rather than getting to and from the freeway on these corridors. Genesee Avenue across Rose Canyon and Governor Drive between Regents Road and Genesee Avenue would have reduced volumes. Volumes on I-5 and I-805 would be reduced. SR-52 would have some increases and some decreases as people change their travel pattern to exit into the community off SR-52 rather than travel to I-5 or I-805 to exit into the community. In general, travel decisions internal to the community are changed to rely less on the freeways and more on the internal community roadways.

Figure 7-8 illustrates the origins and destinations north and south of Rose Canyon that would utilize one of the two bridge crossings with the implementation of Alternative A. On the north side of the canyon, the majority of people are utilizing North University area, with about 10% expected to be in the UCSD footprint and about 5% traveling outside of the community. This is pretty similar to Alternative D. On the south side of the canyon, about 40% are utilizing the South University community, about 38% are traveling between Clairemont, 20% are freeway traffic, and the remaining 2% travel between La Jolla. There is increased access to the freeways south of the community for this alternative when compared to Alternative D. It is estimated that about 60% of crossings use Genesee Avenue and 40% use Regents Road.

Alternative B

Figure 7-9 illustrates the changes that occur with the implementation of Alternative B. The changes would generally be similar to Alternative A, except the travel pattern decision changes would not reach vehicles on La Jolla Village Drive and Nobel Drive like they did on Alternative A.

Figure 7-10 illustrates the origins and destinations north and south of Rose Canyon that would utilize one of the two bridge crossings with the implementation of Alternative B. The patterns would be similar to Alternative A, with about 55% of crossings use Genesee Avenue and 45% use Regents Road.

Alternative C

Figure 7-11 illustrates the changes that occur with the implementation of Alternative C. The change in travel patterns would primarily be people utilizing SR-52 to reach Genesee Avenue rather the I-5 and I-805 freeways adjacent to the community. There would be increased volume on Genesee Avenue across Rose Canyon.

Figure 7-12 illustrates the origins and destinations north and south of Rose Canyon that would utilize the Genesee Avenue bridge crossing with the implementation of Alternative C. The patterns would be similar to Alternative D, with approximately 3% more vehicles traveling through the south side of the community to access freeways.

INTERSECTIONS

Table 7-2 displays the LOS analysis results for the study intersections for each alternative, using the roadway network associated with that alternative and the future peak-hour traffic volumes. The findings are illustrated in **Appendices A - D.** The number of locations that would operate at poor LOS (E or F) during at least one peak period and the number of locations that would be considered to have a significant impact when compared to existing conditions is as follows:

- Alternative A: 29 locations operate at unacceptable LOS, 28 of which are a significant impact.
- Alternative B: 29 locations operate at unacceptable LOS, 29 of which are a significant impact.
- Alternative C: 31 locations operate at unacceptable LOS, 29 of which are a significant impact.
- Alternative D: 31 locations operate at unacceptable LOS, 30 of which are a significant impact.

Appendices G - J contain the peak-hour intersections LOS calculation worksheets.

ROADWAY SEGMENT VOLUME-BASED

Table 7-3 displays the LOS analysis results for the volume-based roadway segments evaluation for each alternative, using the roadway network associated with that alternative and the future daily traffic volumes. The findings are illustrated in **Appendices A - D.** The number of locations that would operate at poor LOS (E or F) and the number of locations that would be considered to have a significant impact when compared to existing conditions is as follows:

- Alternative A: 21 locations operate at unacceptable LOS, 19 of which are a significant impact.
- Alternative B: 23 locations operate at unacceptable LOS, 21 of which are a significant impact.
- Alternative C: 22 locations operate at unacceptable LOS, 20 of which are a significant impact.
- Alternative D: 23 locations operate at unacceptable LOS, 21 of which are a significant impact.

ROADWAY SEGMENT SPEED-BASED

Table 7-4 displays the LOS analysis results for the speed-based roadway segments evaluation for Alternatives A and B, which include the Regents Road Bridge, **Table 7-5** displays the LOS analysis results for the speed-based roadway segments evaluation for Alternatives C and D, which does not include the Regents Road Bridge. Each evaluation was performed using the roadway network associated with that alternative and the future peak-hour traffic volumes. The findings are illustrated in **Appendices A - D.** A summary of the significant impacts by alternative when compared to existing conditions is as follows:

- Alternative A would have significant impacts to all four corridors.
- Alternative B would have significant impacts to all four corridors.
- Alternative C would have significant impacts to three of the four corridors.
- Alternative D would have significant impacts to three of the four corridors.

Table 7-6 provides a summary of the significant impacts by corridor and peak period for each alternative.

Appendices G - J contain tables and graphs that summarize the travel time details along each corridor.

Notes:

Bold values indicate intersections operating at LOS E or F.

(a) Delay refers to the average control delay for the entire intersection, measured in seconds per vehicle. At a two-way stop-controlled intersection, delay refers to the worst movement.

(b) LOS calculations are based on the methodology outlined in the *2010 Highway Capacity Manual* and performed using Synchro 9.0

Notes:

Bold values indicate roadway segments operating at LOS E or F.

(a) Road classifications are based on _____

(b) Average Daily Traffic (ADT) volumes for the roadway segments were determined from SANDAG Modeling

(c) The v/c Ratio is calculated by dividing the ADT volume by each respective roadway segment's capacity.

Notes:

(a) Speed is calculated as the roadway segment distance divided by the travel time in miles per hour (mph).

(b) The arterial LOS is based on average through-vehicle travel speed for the segment or for the entire street under consideration and is influenced both by the number of signals per mile and by the intersection control delay.

(c) Midday Peak La Jolla Village Dr arterial segment from Torrey Pines Rd to I-805 Southbound Ramps

8 FREEWAYS

This section includes the results of existing conditions analyses at the study area freeway segments and ramps.

SUMMARY OF PLANNED PROJECTS

The following changes to the freeway network were included in the model and reflected in the freeway analysis:

- I-5 HOV lanes, north of La Jolla Village Drive
- DARs at I-5 and Voigt Drive
- I-805 HOV lanes throughout study area
- New hook ramp from Governor to SB I-805
- Direct access ramps at I-805 and Nobel Drive
- DARS at I-805 and Carroll Canyon (outside of community influence)
- Carroll Canyon extension to Sorrento Valley Road (outside of community influence)
- Carroll Canyon to I-805 SB Ramp modification (outside of community influence)

FUTURE NETWORK ANALYSIS

FREEWAY SEGMENTS

Table 8-1 displays the LOS analysis results for the freeway segments adjacent to the community during the morning and afternoon peak hours using the future freeway configuration and the future peak-hour traffic volumes. Freeway volumes were obtained from the SANDAG model runs prepared for this CPA. The freeways were evaluated using procedures for a freeway mainline as outlined in the HCM. The findings are illustrated in **Appendices A - D.**

While the speed and density varies for each alternative, the number of locations that would operate at poor LOS (E or F) during at least one peak period and the number of locations that would be considered to have a significant impact when compared to existing conditions is the same for each alternative.

- I-5 has one location with poor operations and a significant impact.
- All of I-805 (four segments) has poor operations and significant impacts.
- All of SR-52 (three segments) has poor operations and significant impacts.

In general, the failing segments are those that move traffic towards the University community in the morning and away from the University community in the afternoon. **Appendix F** includes the “k” and “d” factors published by Caltrans that are included in the analysis.

FREEWAY ENTRANCE RAMPS

Freeway entrance ramps that currently have ramp meters installed and in operation were evaluated to determine the delay and queue associated with the ramp meters. No new ramp meter locations were assumed.

Caltrans provided a range of possible meter rates at each location, which is adjusted based on traffic flow on the freeway. **Appendix F** contains the ramp meter rates provided by Caltrans. The most restrictive rates were used for this analysis. Ramp volumes were obtained from the intersection turning movements estimated at each location for each alternative.

Calculations were made using the peak hour demand at the entrance ramp and the most restrictive meter rate to quantify the number and frequency of vehicles that are processed through the meter. The excess demand not being processed is then quantified along with its respective queue length. **Table 8-2** displays the results of the freeway ramp meters in the study area.

Similar to the freeway mainline analysis, the number of locations that would experience delays over 15 minutes and the number of locations that would be considered to have a significant impact when compared to existing conditions is the same for each alternative.

- Seven of the ramp meters for I-5 have poor operations and significant impacts.
- One ramp meter for I-805 has poor operations and a significant impact.

It is expected that delays over 15 minutes lead people to use an alternate route or choose to use the ramp during a different time period.

.

	Alt D (No Bridge, 4-Lane Genesee)	120	449	n/a	500		0		0		0	--

Notes:

(a) The ramp meter rate are based on the most restrictive rate obtained from Caltrans and assumed to be the same under the Future Year scenarios.

(b) A significant impact resulted in an increase in delay of more than 2 min with ramp delays less than 15 minutes or more than 1 min with ramp delays greater than 15 minutes.

Table 8-2 Future Year Freeway Ramp Metering Operations Summary (continued)

On-Ramp	Scenario	Total General Purpose Peak Hour Volume (veh/hr/ln)		Ramp Meter Rate (veh/hr/ln) (a)		Excess Demand (veh/hr)		Delay (min)		Queue Length (ft/ln)		Impact? (b)
		AM	PM	AM	PM	AM	PM	AM	PM	AM	PM

Notes:

(a) The ramp meter rate are based on the most restrictive rate obtained from Caltrans and assumed to be the same under the Future Year scenarios.

(b) A significant impact resulted in an increase in delay of more than 2 min with ramp delays less than 15 minutes or more than 1 min with ramp delays greater than 15 minutes.

9 PUBLIC TRANSIT

There are several types of transit currently serving the University community, a trolley line currently under construction, and more planned changes to transit service in the area. **Figure 9-1** shows an overview of the current and planned transit system within the community.

EXISTING NETWORK

Data regarding the existing setting was collected in 2015 and is documented in more detail in the University Community Existing Conditions Report. The following is a quick summary of available transit in the community.

BUS ROUTES

Bus routes within the University community include:

- MTS Route 30: Downtown – UTC/VA Medical Center
- MTS Routes 31 and 921: UTC – Mira Mesa
- MTS Route 41: Fashion Valley – UCSD/VA Medical Center
- MTS Route 50: Downtown – UTC Express
- MTS Route 150: Downtown – UTC/ VA Hospital Express
- MTS Route 60: Euclid Transit Center – UTC
- NCTD Route 101: Oceanside – VA/UCSD
- MTS Route 105: Old Town – UTC
- MTS SuperLoop 201/202: UTC Transit Center – UCSD
- MTS SuperLoop 204: UTC East Loop
- MTS Rapid Route 237: Rancho Bernardo – UCSD
- MTS Coaster Connection Route 978: Torrey Pines
- MTS Coaster Connection Route 979: North University City

A description and map of each of the bus routes within the community is provided in **Appendix L**.

SHUTTLE SERVICES

The UCSD Transportation Services provides eight shuttle routes that serve the University community. The shuttle routes specifically serve the campus, medical centers, and other key points off campus. Students, faculty, and staff can ride the shuttles for free. All shuttles operate during academic quarters with some shuttles operating year-round. A description and map of the shuttle routes is provided in **Appendix L.**

RAIL SERVICES

There are two rail lines that travel through the University community: the NCTD COASTER and the AMTRAK Pacific Surfliner.

- The COASTER is a commuter rail line operated by NCTD that runs north to south from Oceanside to downtown San Diego through the University community. The COASTER serves eight stations including Santa Fe Depot, Old Town, Sorrento Valley, Solana Beach, Encinitas, Carlsbad Poinsettia, Carlsbad Village, and Oceanside. It takes about an hour to travel the entire route from downtown San Diego (Santa Fe Depot) to the Oceanside Transit Center.

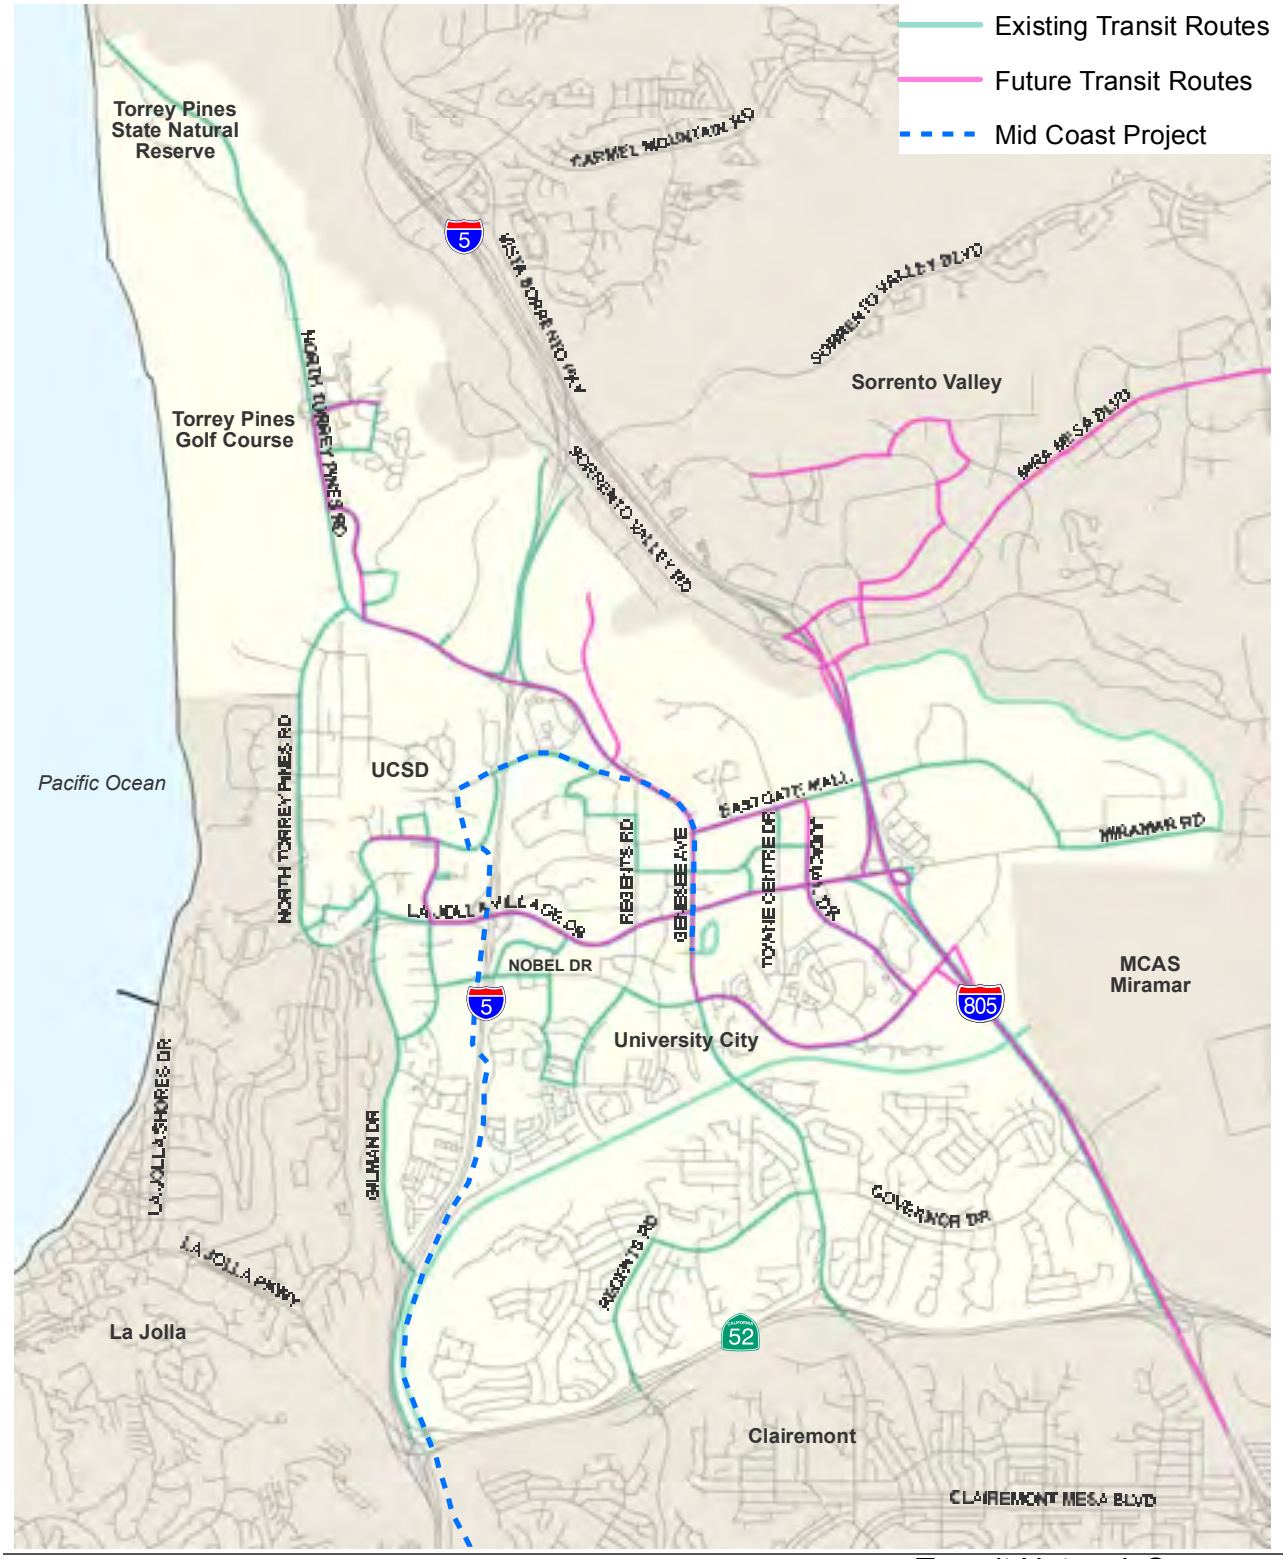
- The Pacific Surfliner is a passenger rail line operated by AMTRAK that runs north to south from San Luis Obispo to downtown San Diego through the University community. The Pacific Surfliner serves thirty stations including the eight COASTER stations stated above, as well as Anaheim, Santa Barbara, and Los Angeles.

FUTURE NETWORK CHANGES

A key focus of the Regional Transportation Plan prepared by the San Diego Association of Governments (SANDAG) is to develop an ambitious and far-reaching transit network that significantly expands the role that transit plays. This regional goal greatly applies to the transit network in the University community, as there have been significant investments made in the transit network that will be operational in the near future. As identified in the SANDAG 2050 Regional Transportation Plan (2050 RTP), these improvements include different transit options such as Light Rail Transit (LRT), Bus Rapid Transit (BRT), and High Frequency (Rapid) Local Bus. The Future Year conditions included transit projects identified in the 2050 RTP that are planned to be implemented by Year 2035. The following summarizes these planned improvements for the University community:

- **COASTER Improvements**. The COASTER commuter train is planned to be expanded to have double tracking and increased frequencies between Oceanside and downtown San Diego. It is planned to achieve 20 minute peak headways. The expected year for completion of this improvement is 2018.
- **Mid-Coast LRT Extension**. The Blue Line Trolley is planned to be extended from the Old Town Transit Center to the UTC Transit Center. Stops with in the University Community are planned to be located at Nobel Drive near I-5, the VA Medical Center, UCSD, Voigt Drive, Executive Drive, and the UTC Transit Center. The expected year for completion of this improvement is 2018.
- **Route 470** is a planned BRT service connecting Escondido to UTC/UCSD. The expected year for completion of this improvement is 2018.
- **Route 680** is a planned BRT service connecting Otay Mesa to Sorrento Mesa using I-805. There is a possible direct access ramp (DAR) connection to the University community near UTC. The expected year for completion of this improvement is 2018.
- **Route 688** is a planned BRT Express service between San Ysidro and Sorrento Mesa that would serve the University community. The expected year for completion of this improvement is 2018.
- **Route 689** is a planned BRT Express service between Millenia/Otay Ranch and UTC/Torrey Pines that would serve the University community and provide connections to the research and employment center along North Torrey Pines Road. The expected year for completion of this improvement is 2018.
- **UTC Area Super Loop** is planned to have increased Rapid bus frequency of routes 201 and 202 to provide 10 minute peak and 15 minute off-peak headways. The expected year for completion of this improvement is 2018. The off-peak headway is planned to be further reduced to 10 minute headways by 2035.
- **Route 870** is planned to provide BRT service between El Cajon and UTC/Campus point during peak hours and would extend the existing Route 870, serving the University community. The expected year for completion of this improvement is 2020.
- **Route 561** is a planned Trolley line or Urban Aerial Ropeway that would connect between UTC and Mira Mesa. This would serve as an extension to the Mid-Coast LRT line. The expected year for completion of this improvement is 2030.
- **Route 30** is a planned addition of Rapid Bus service to the existing route, providing 10-minute headways and connections between Old Town and Sorrento Mesa including the UTC area. The expected year for completion of this improvement is 2030.
- **Route 47** is a planned Rapid Bus service providing connections between Oceanside and UTC. The expected year for completion of this improvement is 2030.

FIGURE 9-1



Transit Network Summary

TRANSIT TRAVEL TIMES

Tables 9-1 through 9-5 compare the vehicle travel time along the key corridors in the University community. This comparison was made to assess the impact on overall travel time as a result of changes to the network.

The travel time along Genesee Avenue is greatly affected by the network alternative which include MTS Routes 41, 50, 105. Alternative A results in a significantly less travel time from one end of the community to the other when compared to other alternatives. Alternative D has the longest travel times along Genesee Avenue.

The travel times along La Jolla Village Drive and Nobel Drive vary slightly between the alternatives but are not heavily influenced by the network alternative.

The travel time along Regents Road is similar for Alternatives A and B, and similar for Alternatives C and D. There is not a good comparison between all alternatives as providing the bridge connection is a different travel pattern to evaluate and increases the overall distance traveled along Regents Road consecutively. No conclusions can be made from the Regents Road travel time analyses. Feedback received from MTS was that the Regents Road bridge would likely not be a candidate for many transit routes anyways, so travel time may not be an important consideration.

COMMUNITY RECOMMENDATIONS

As discussed in the existing conditions report, one of the key chokepoints identified that causes delays for buses in the community was the portion of Genesee Avenue between Nobel Drive and Governor Drive. Delays occur frequently during peak periods and there is no alternative route to cross Rose Canyon. Future travel time through this corridor would vary depending on the selected alternative. With Alternatives A and C, this portion of the corridor would have increased capacity. Alternative B may also have some increased capacity at select locations along this corridor. Alternative D would not provide increased capacity for vehicle travel along Genesee Avenue between Nobel Drive and SR-52 and travel time duration and consistency would remain a concern for buses traveling this route. For Alternatives C and D, the roadway cross-section should be evaluated to consider the implementation of transit bypass lanes at congested areas and intersections.

Table 9-1 Genesee Avenue Travel Time by Alternative Summary

10 SIGNIFICANCE OF IMPACTS AND MITIGATION MEASURES

This chapter addresses the project impacts for each of the future alternatives based on a comparison between the Future Year conditions and the Existing conditions. Per the City's significance thresholds and the analysis methodology presented in this report, the following cumulative impacts were determined:

SIGNIFICANCE OF IMPACTS

INTERSECTIONS

- Genesee Avenue & John Hopkins Drive
- Genesee Avenue & Scripps Hospital
- Genesee Avenue & La Jolla Village Drive
- Genesee Avenue & Esplanade Court
- Genesee Avenue & Nobel Drive
- Genesee Avenue & Decoro Street
- Genesee Avenue & Centurion Square
- Genesee Avenue & Governor Drive
- Genesee Avenue & SR-52 Westbound Ramps
- Genesee Avenue & SR-52 Eastbound Ramps
- Genesee Avenue & Appleton Street/Lehrer Drive
- Genesee Avenue & Torrey Pines Road
- La Jolla Village Drive Eastbound & Gillman Drive
- La Jolla Village Drive & Villa La Jolla Drive
- La Jolla Village Drive & I-5 Southbound Off-Ramps
- La Jolla Village Drive & Regents Road
- La Jolla Village Drive & Executive Way
- La Jolla Village Drive & Towne Centre Drive
- La Jolla Village Drive & I-805 Southbound Ramps
- Miramar Road & Eastgate Mall
- Miramar Road & Camino Santa Fe
- Nobel Drive & La Jolla Village Square Driveway
- Nobel Drive & I-5 Southbound On-Ramp
- Nobel Drive & Regents Road
- Nobel Drive & Arriba Street
- Nobel Drive & Governor Drive
- Nobel Drive & Luna Avenue
- N. Torrey Pines Road & La Jolla Shores Drive
- Towne Centre Drive & Eastgate Mall
- Executive Way & Executive Drive
- Judicial Drive & Eastgate Mall
- Governor Drive & I-805 Northbound Ramps
- Gilman Drive & I-5 Southbound Ramps

SEGMENTS

- Eastgate Mall from Genesee to Easter Way
- Eastgate Mall from Judicial Drive to Eastgate Drive (Freeway Overpass)
- Eastgate Mall from Eastgate Drive to Miramar Road
- Genesee Avenue from La Jolla Village Drive to Esplanade Court
- Genesee Avenue from Nobel Drive to Centurion Square
- Genesee Avenue from Centurion Square to Governor Drive
- Genesee Avenue from Governor Drive to SR-52 Westbound Ramps
- Genesee Avenue from SR-52 Westbound Ramps to SR-52 Eastbound Ramps
- Genesee Avenue from SR-52 Eastbound Ramps to Lehrer Drive
- La Jolla Village Drive from Revelle College Drive to Villa La Jolla
- La Jolla Village Drive from Villa La Jolla Drive to I-5 Southbound Ramps
- La Jolla Village Drive from I-5 Southbound Ramps to I-5 Northbound Ramps
- La Jolla Village Drive from I-5 Northbound Ramps to Lebon Drive
- La Jolla Village Drive from Lebon Drive to Regents Road
- La Jolla Village Drive from Regents Road to Genesee Avenue
- La Jolla Village Drive from Executive Way to Towne Centre Drive
- La Jolla Village Drive from Towne Centre Drive to I-805 Southbound Ramps
- Miramar Road from Miramar Mall to Camino Santa Fe
- Nobel Drive from Villa La Jolla Drive to I-5 Southbound On-Ramp
- Nobel Drive from I-5 Southbound On-Ramp to I-5 Northbound Off-Ramp/University Center Lane
- Nobel Drive from Avenue of Flags to Miramar Road
- Regents Road from SR-52 Westbound Ramps to SR-52 Eastbound Ramps
- Regents Road from SR-52 Eastbound Ramps to Luna Avenue
- Torrey Pines Road from La Jolla Village Drive to South

CORRIDORS

- Genesee Avenue, between SR-52 and North Torrey Pines Road
- La Jolla Village Drive, between Torrey Pines Road and I-805
- Nobel Drive, between La Jolla Village Square and Miramar Road
- Regents Road, between Luna Avenue and Genesee Avenue

FREEWAY SEGMENTS

- Interstate 5 between:
    - SR-52 and Gilman Drive
- Interstate 805 between:
    - SR-52 and Governor Drive
    - Governor Drive and Nobel Drive
    - Nobel Drive and La Jolla Village Drive
    - La Jolla Village Drive and Mira Mesa Boulevard
- State Route 52 between:
    - Interstate 5 and Regents Road
    - Regents Road and Genesee Avenue
    - Genesee Avenue and Interstate 805

FREEWAY RAMPS

- Interstate 5 Southbound at Gilman Drive
- Interstate 5 Southbound at Nobel Drive
- Interstate 5 Northbound at Westbound La Jolla Village Drive
- Interstate 5 Northbound at Eastbound La Jolla Village Drive
- Interstate 5 Southbound at Westbound La Jolla Village Drive
- Interstate 5 Southbound at Eastbound La Jolla Village Drive
- Interstate 5 Northbound at Genesee Avenue
- Interstate 805 Southbound at Nobel Drive

MITIGATION MEASURES

INTERSECTIONS

This section identifies required mitigation measures for roadway and intersections that would be significantly impacted under Alternatives A, B, C and D when compared to Existing Conditions (Plan to Ground). For comparison purposes between alternatives, Appendix N was created to show differences for each alternative when compared to the current plan recommendations evaluated as Alternative A.

Genesee Avenue & John Hopkins Drive (Intersection 2):

- Alternatives A, B, C and D when compared to Existing Conditions: Repurpose one of the five westbound through lanes on Genesee Avenue to become a second right turn lane. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C, and D Recommended Improvements: Repurposing one of the five westbound through lanes on Genesee Avenue to become a second right turn lane is recommended under these alternatives. Accommodating the high volume right-turn to John Hopkins Drive reduces queues for through traffic on Genesee Avenue. A third through lane on Genesee Avenue is not anticipated to be needed from this intersection and on to the west/north through the intersections along North Torrey Pines Road, providing flexibility in the use of the roadway to accommodate bicycle facilities. This improvement project is not identified in the NUC PFFP. The project would be added to the NUC PFFP for each of these alternatives.

Genesee Avenue & Scripps Hospital (Intersection 6):

- Alternatives A, B, C and D when compared to Existing Conditions: Add a second left turn lane from Genesee Avenue to Scripps Hospital and install an overlap phase for the right-turn from Scripps Hospital to Genesee Avenue. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C, and D Recommended Improvements: Adding a second left turn lane from Genesee Avenue to Scripps Hospital and installing an overlap phase for the right-turn from Scripps Hospital to Genesee Avenue is not recommended under these alternatives.

There is not adequate room to add a second westbound left-turn lane without eliminating a bicycle facility, which would result in impacts to non-vehicular modes of travel, or widening the roadway, which would result in reduced width for pedestrian facilities or involve the expansion of current right-of-way through additional property acquisition. Increased intensity of the land uses south of this intersection should rely on the new LRT and supporting transit investments being made to get people to and from this area. This improvement project is not identified in the NUC PFFP and would not be added for any of these alternatives.

Genesee Avenue & La Jolla Village Drive (Intersection 12):

- Alternatives A, B, C and D when compared to Existing Conditions: Construct a fourth westbound through lane and a third eastbound left-turn lane on La Jolla Village Drive. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C, and D Recommended Improvements: Constructing a fourth westbound through lane and a third eastbound left-turn lane on La Jolla Village Drive is not recommended under these alternatives. Roadway widening would involve the expansion of current right-of-way through additional property acquisition. Property acquisitions, however, are considered environmentally, financially, and socially infeasible. This improvement project is not identified in the NUC PFFP and would not be added for any of these alternatives.

Genesee Avenue & Esplanade Court (Intersection 13):

- Alternatives A, B, C and D when compared to Existing Conditions: Modify the westbound approach of Esplanade Court to include two left turn lanes, one through lane, and two right-turn lanes. The significant traffic impact, associated with Alternatives A, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure. The significant traffic impact, associated with Alternative B, to this roadway intersection would not be fully mitigated with the implementation of this measure and no additional mitigation was considered feasible.

- Alternatives A, B, C, and D Recommended Improvements: Modifying the westbound approach of Esplanade Court to include two left turn lanes, one through lane, and two right-turn lanes is not recommended under these alternatives. Increased intensity of the land uses east of this intersection should rely on the new LRT and supporting transit investments being made to get people to and from this area instead of widening roadways to accommodate additional personal vehicles. Further, widening of the westbound approach increases pedestrian crossing distances. This improvement project is not identified in the NUC PFFP and would not be added for any of these alternatives.

Genesee Avenue & Nobel Drive (Intersection 14):

- Alternatives A, B, C, and D when compared to Existing Conditions: Construct a third westbound through-lane along Nobel Drive and install an eastbound right-turn overlap phase (for Alternatives A, B, C, and D) and install a third northbound through lane on Genesee Avenue (for Alternatives B and D). The significant traffic impact, associated with Alternatives A and B, to this roadway intersection would be fully mitigated with the

implementation of these measures. The significant traffic impact, associated with Alternatives C and D, to this roadway intersection would not be fully mitigated with the implementation of these measures and no additional mitigation was considered feasible.

- Alternatives A and C Recommended Improvements: Constructing a third westbound through-lane along Nobel Drive is not recommended under these alternatives. Addition of a third westbound through-lane would require widening of Nobel Drive that would negatively affect the bicycle and pedestrian environment at the intersection. Nobel Drive is planned to be a key bicycle facility connection in the community and adding additional travel lanes increases the level of stress for bicyclists. The widening would also increase the pedestrian crossing distance. This improvement project is not identified in the NUC PFFP and would not be added for any of these alternatives.

- Alternative B Recommended Improvements: Constructing a third westbound through-lane along Nobel Drive is not recommended; however, the installation of an eastbound right-turn overlap phase, and addition of a third northbound through lane on Genesee Avenue (NUC-A) is recommended under these alternatives. Addition of a third westbound through-lane would require widening of Nobel Drive that would negatively affect the bicycle and pedestrian environment at the intersection. Nobel Drive is planned to be a key bicycle facility connection in the community and adding additional travel lanes increases the level of stress for bicyclists. The widening would also increase the pedestrian crossing distance. Addition of a third northbound through lane is included in the University PFFP and would be implemented under this alternative. As a result, the significant traffic impacts to this intersection would be partially mitigated with the implementation of these measures and; therefore, impact to this intersection would remain significant and unmitigated.

- Alternative D Recommended Improvements: Constructing a third westbound through-lane along Nobel Drive and addition of a third northbound through lane on Genesee Avenue is not recommended under this alternative. Addition of a third westbound through-lane would require widening of Nobel Drive that would negatively affect the bicycle and pedestrian environment at the intersection. Nobel Drive is planned to be a key bicycle facility connection in the community and adding additional travel lanes increases the level of stress for bicyclists. The widening would also increase the pedestrian crossing distance. Addition of a third northbound through lane is included in the NUC PFFP; however, Alternative D analyzes the network without that project in place. As a result, under Alternative D the significant traffic impact to this intersection would remain significant and unmitigated.

Genesee Avenue & Decoro Street (Intersection 15):

- Alternatives B, C and D when compared to Existing Conditions: Construct a third northbound and southbound lane on Genesee Avenue (for Alternative B) and stripe eastbound and westbound right-turn lanes on Decoro Street (for Alternatives B, C, and D). The significant traffic impact, associated with Alternatives B and C, to this roadway intersection would be fully mitigated with the implementation of these measures. The significant traffic impact, associated with Alternative D, to this roadway intersection would not be fully mitigated with the implementation of these measures and no additional mitigation was considered feasible.

- Alternative B Recommended Improvements: Striping eastbound and westbound right-turn lanes on Decoro Street is recommended as part of the University Community Plan Amendment under this alternative. There is adequate width to add the lane without street width modifications and bicycle and pedestrians would not be impacted by the change. Vehicles currently can stack two wide as if there was a right-turn lane, but only if vehicles are not utilizing the curb parking. On-street parking would need to be removed to add the right-turn pockets. Addition of a third northbound and southbound through lane is included in the University PFFP and FBA under NUC-A, which would be modified to include the additional through lanes with a repurposing of the current roadway under this alternative. As a result, the significant traffic impacts to this intersection would be fully mitigated.

- Alternative C Recommended Improvements: Striping eastbound and westbound right-turn lanes on Decoro Street is recommended as part of the University Community Plan Amendment under this alternative. There is adequate width to add the lane without street width modifications and bicycle and pedestrians would not be impacted by the change. Vehicles currently can stack two wide as if there was a right-turn lane, but only if vehicles are not utilizing the curb parking. On-street parking would need to be removed to add the right-turn pockets. Addition of a third northbound and southbound through lane is included in the University PFFP and FBA under NUC-A. As a result, the significant traffic impacts to this intersection would be fully mitigated.

- Alternative D Recommended Improvements: Striping eastbound and westbound right-turn lanes on Decoro Street is recommended as part of the University Community Plan Amendment under this alternative. There is adequate width to add the lane without street width modifications and bicycle and pedestrians would not be impacted by the change. Vehicles currently can stack two wide as if there was a right-turn lane, but only if vehicles are not utilizing the curb parking. On-street parking would need to be removed to add the right-turn pockets. Addition of a third northbound and southbound through lane is included in the University PFFP and Alternative D analyzes the network without that project in place. As a result, the significant traffic impacts to this intersection would be partially mitigated with the implementation of these measures and; therefore, impact to this segment would remain significant and unmitigated.

Genesee Avenue & Centurion Square (Intersection 16):

- Alternative D when compared to Existing Conditions: Construct a third northbound and southbound lane on Genesee Avenue. The significant traffic impact, associated with Alternative D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternative D Recommended Improvements: Addition of a third northbound and southbound through lane is included in the University PFFP and Alternative D analyzes the network without that project in place. As a result, the significant traffic impacts to this intersection would remain significant and unmitigated.

Genesee Avenue & Governor Drive (Intersection 17):

- Alternatives A, B, C and D when compared to Existing Conditions: Construct a grade separated intersection (removing northbound and southbound through-movements), with two northbound and southbound through-lanes in the undercrossing. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A Recommended Improvements: Constructing a grade separated intersection (removing northbound and southbound through-movements), with two northbound and southbound through-lanes in the undercrossing is not recommended as part of the University Community Plan Amendment under this alternative. Instead, surface-level improvements at the existing intersection are recommended. These improvements would be the addition of a northbound right-turn lane. This requires some modification to the existing curb to accommodate the right-turn pocket. The significant traffic impact, associated with Alternatives A, to this roadway intersection would be fully mitigated with the implementation of this measure. This improvement project is identified in the University PFFP under NUC-A and would be modified for this alternative.

- Alternatives B Recommended Improvements: Construct a grade separated intersection (removing northbound and southbound through-movements), with two northbound and southbound through-lanes in the undercrossing is not recommended as part of the University Community Plan Amendment under this alternative. Instead, surface-level improvements at the existing intersection are recommended. These improvements would be the addition of a northbound and southbound through lane, maintaining exclusive right-turn lanes in each direction. This requires some modifications to the existing curb to accommodate the right-turn pockets. The significant traffic impact, associated with Alternative B, to this roadway intersection would be fully mitigated with the implementation of this measure. This improvement project is identified in the University PFFP under NUC-A and would be modified for this alternative.

- Alternatives C and D Recommended Improvements: Constructing a grade separated intersection (removing northbound and southbound through-movements), with two northbound and southbound through-lanes in the undercrossing is recommended as part of the University Community Plan Amendment under each of these alternatives. The topography of Genesee Avenue approaching this intersection allows for the intersection to remain at its current elevation and an undercrossing to be constructed beneath it. Separating the through traffic on Genesee Avenue will significantly increase flow between the north and south areas of the University community. Businesses at the intersection would still have access and provide services to the adjacent community, but would experience less traffic on their adjacent roads. The significant traffic impact, associated with Alternatives C and D, to this roadway intersection would be fully mitigated with the implementation of this measure. This improvement project is not identified in the University PFFP and would be added under these alternatives.

Genesee Avenue & SR-52 Westbound Ramps (Intersection 18):

- Alternatives A, B, C and D when compared to Existing Conditions: Signalize the intersection and square up ramps, adding a protected phase for northbound left-turns from Genesee Avenue to the SR-52 ramp, and add a second right-turn lane on the exit ramp. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Signalizing the intersection, squaring up ramps, adding a protected phase for northbound left-turns from Genesee Avenue to the SR-52 ramp, and adding a second right-turn lane on the exit ramp is recommended as part of the University Community Plan Amendment under these alternatives. The project not only improves vehicle operations, but improves safety for bicyclists, pedestrians, and vehicles by removing free movements and controlling movements at the signal. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure. This improvement project is not identified in the University PFFP and would not be added under these alternatives since it's a State facility under Caltrans District 11 jurisdiction.

Genesee Avenue & SR-52 Eastbound Ramps (Intersection 19):

- Alternatives C and D when compared to Existing Conditions: Add a second southbound left-turn lane from Genesee Avenue to the eastbound SR-52 entrance ramp. The significant traffic impact, associated with Alternatives C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives C and D Recommended Improvements: Adding a second southbound left-turn lane from Genesee Avenue to the eastbound SR-52 entrance ramp is not recommended under these alternatives. There is not adequate room to add a second southbound left-turn lane without eliminating a bicycle facility, which would result in impacts to non-vehicular modes of travel, or widening the bridge, which would result in significant costs and environmental impacts. As a result, the significant traffic impacts to this intersection would remain significant and unmitigated. This improvement project is not identified in the University PFFP and would not be added for any of these alternatives.

Genesee Avenue & Appleton Street/Lehrer Drive (Intersection 20):

- Alternatives A, B, C and D when compared to Existing Conditions: Modify Appleton Street to have two eastbound left-turn lanes and a shared through-right lane, modify Lehrer Street to have one westbound left-turn lane, a shared through-right lane, and an exclusive right turn lane, and change the eastbound and westbound phasing to provide protected left turns. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Modifying Appleton Street to have two eastbound left-turn lanes and a shared through-right lane, modifying Lehrer Street to have one westbound left-turn lane, a shared through-right lane, and an exclusive right turn lane, and changing the eastbound and westbound phasing to provide protected

left turns is not recommended under these alternatives because it is outside of the community boundary. As a result, the significant traffic impacts to this intersection would remain significant and unmitigated.

La Jolla Village Drive & Torrey Pines Road (Intersection 21):

- Alternatives A, B, C and D when compared to Existing Conditions: Relocate the pedestrian crossing from the east leg to the west leg of the intersection and implement signal phasing modification to improve operation. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Relocating the pedestrian crossing from the east leg to the west leg of the intersection and implementing signal phasing modification to improve operation is recommend as part of the University Community Plan Amendment under these alternatives. The crosswalk on the east leg of the intersection conflicted with the heaviest movements at the intersection: dual northbound right-turns and dual westbound left-turns. Moving the crosswalk to the other side of the intersection decreases the amount of vehicles that the pedestrians would have a potential conflict with, improving the safety for pedestrians. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure. This improvement project is not identified in the University PFFP and would be added for any of these alternatives.

La Jolla Village Drive Eastbound Ramps & Gilman Drive (Intersection 23b):

- Alternatives A, B, C and D when compared to Existing Conditions: Signalize the intersection and install a protected southbound left turn phase, re-stripe eastbound ramp approach to have a shared left-right lane, and an exclusive right-turn lane. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Signalizing the intersection, installing a protected southbound left turn phase, and re-striping eastbound ramp approach to have a shared left-right lane and an exclusive right-turn lane is recommended as part of the University Community Plan Amendment under these alternatives. Signalizing the intersection improves the operations of the intersection, and also improves the safety for bicyclists, pedestrians, and vehicles. The signal provides control of conflicting movements to avoid potential conflicts between all users. This improvement should be completed concurrent with installation of a protected bikeway on Gilman Drive. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure. This improvement project is not identified in the University PFFP and would be added for any of these alternatives.

La Jolla Village Drive & Villa La Jolla Drive (Intersection 24):

- Alternatives A, B, C and D when compared to Existing Conditions: Construct a second westbound right-turn lane from La Jolla Village Drive to Villa La Jolla Drive and add a third

southbound left turn lane from Villa La Jolla Drive to La Jolla Village Drive. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would not be fully mitigated with the implementation of this measure and no additional improvements are considered feasible.

- Alternatives A, B, C and D Recommended Improvements: Constructing a second westbound right-turn lane from La Jolla Village Drive to Villa La Jolla Drive is recommended under these alternatives. Providing additional queue space and processing time for the right-turn movement reduces the potential of right-turning traffic blocking through traffic on La Jolla Village Drive. There is not a pedestrian crossing on the east leg of the intersection, so the widening would not increase pedestrian crossing distance. Adding a third southbound left turn lane from Villa La Jolla Drive to La Jolla Village Drive is not recommended under these alternatives. Triple left-turn movements can be a safety concern and typically are used only in special circumstances. Increased intensity of the land uses north of this intersection should rely on the new LRT and supporting transit investments being made to get people to and from this area. The additional right-turn lane would improve the function of the intersection, but not completely restore it to acceptable levels. As a result, the significant traffic impacts to this intersection would be partially mitigated, but remain significant and unmitigated. This improvement project is not identified in the University PFFP and would be added for any of these alternatives.

La Jolla Village Drive & I-5 Southbound Off-Ramps (Intersection 25):

- Alternatives C and D when compared to Existing Conditions: Modify one of the westbound through lanes to be a shared through-right lane, creating dual right-turns. The significant traffic impact, associated with Alternatives C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives C and D Recommended Improvements: Modifying one of the westbound through lanes to be a shared through-right lane, creating dual right-turns is not recommended as part of the University Community Plan Amendment under these alternatives. This improvement would require eliminating the HOV lane on the freeway entrance ramp or widening the ramp. Eliminating the HOV lane would discourage carpooling and transit use. Widening of the ramp is infeasible without complete reconfiguration of the interchange due to the lack of available vacant space between the entrance and exit ramps. As a result, the significant traffic impacts to this intersection would remain significant and unmitigated. This improvement project is not identified in the University PFFP and would not be added for any of these alternatives.

La Jolla Village Drive & Regents Road (Intersection 28):

- Alternatives A, B, C, and D when compared to Existing Conditions: Construct a fourth eastbound and westbound through lane along La Jolla Village Drive and add a second southbound left turn lane from Regents Road to La Jolla Village Drive. The significant traffic impact, associated with Alternatives A, B, C, and D, to this roadway intersection would not be fully mitigated with the implementation of this measure and no additional improvements are considered feasible.

- Alternatives A, B, C, and D Recommended Improvements: Constructing a fourth eastbound and westbound through lane along La Jolla Village Drive is not recommended under these alternatives. Roadway widening would involve the expansion of current right-of-way through additional property acquisition. Property acquisitions, however, are considered environmentally, financially, and socially infeasible. Widening of Regents Road would be required to add the additional left-turn lane, and this location is constrained on both sides such that property acquisition would be required. Therefore, the addition of a second southbound left-turn lane is not recommended. The significant traffic impact, associated with Alternatives A, B, C, and D, to this roadway intersection would remain significant and unmitigated. This improvement project is not identified in the University PFFP and would not be added for any of these alternatives.

La Jolla Village Drive & Executive Way (Intersection 29):

- Alternatives A, B, C and D when compared to Existing Conditions: Construct a fourth eastbound and westbound through lane along La Jolla Village Drive, and modify the northbound and southbound approach of Executive Way to have two left-turn lanes, one through lane, and one right-turn lane with an overlap phase. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C, and D Recommended Improvements: Constructing a fourth eastbound and westbound through lane along La Jolla Village Drive is not recommended under these alternatives. Roadway widening would involve the expansion of current right-of-way through additional property acquisition. Property acquisitions, however, are considered environmentally, financially, and socially infeasible. Widening of Executive Way would be required to add the needed lanes, and this location is constrained on both sides such that property acquisition would be required. Therefore, the additional lanes on Executive Way is not recommended. The significant traffic impact, associated with Alternatives A, B, C, and D, to this roadway intersection would remain significant and unmitigated. This improvement project is not identified in the University PFFP and would not be added for any of these alternatives.

La Jolla Village Drive & Towne Centre Drive (Intersection 30):

- Alternatives A, B, C and D when compared to Existing Conditions: Construct a fourth eastbound through lane on La Jolla Village Drive (maintaining the exclusive right turn lane), convert westbound right-turn lane to a shared through-right lane, add an exclusive southbound right-turn lane, and remove the pedestrian crossing on the east leg. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Constructing a fourth eastbound through lane on La Jolla Village Drive (maintaining the exclusive right turn lane), converting westbound right-turn lane to a shared through-right lane, adding an exclusive southbound right-turn, and removing the pedestrian crossing on the east leg lane are not recommended under these alternatives. This intersection serves all traffic from I-805 that access the north University area and will continue to have high vehicle volumes despite community efforts

for other modes of travel. The southbound left-turn and eastbound right-turn lane would require widening and would increase pedestrian crossing distance, but is needed for maximizing vehicle efficiency for this location. Roadway widening would involve the expansion of current right-of-way through additional property acquisition. Property acquisitions, however, are considered environmentally, financially, and socially infeasible. Removing the pedestrian crossing on the east leg limits pedestrian access options, but also limits potential conflict points between pedestrians and vehicles at this high volume intersection. The significant traffic impact, associated with Alternatives A, B, C, and D, to this roadway intersection would remain significant and unmitigated. This improvement project is not identified in the University PFFP and would not be added for any of these alternatives.

La Jolla Village Drive & I-805 Southbound Ramps (Intersection 31):

- Alternatives A, B, C and D when compared to Existing Conditions: Construct a fourth westbound through-lane and modify the ramp to provide a third southbound right-turn lane. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Constructing a fourth eastbound and westbound through lane along La Jolla Village Drive is not recommended under these alternatives. Roadway widening would involve the expansion of current right-of-way through additional property acquisition. Property acquisitions, however, are considered environmentally, financially, and socially infeasible. Modify the ramp to provide a third southbound right-turn lane is not recommended under these alternatives. Triple right-turn movements can be a safety concern and typically are used only in special circumstances. As a result, the significant traffic impacts to this intersection would remain significant and unmitigated. This improvement project is not identified in the University PFFP and would not be added for any of these alternatives.

Miramar Road & Eastgate Mall (Intersection 34):

- Alternatives A, B, C and D when compared to Existing Conditions: Modify the southbound Eastgate Mall approach to have two left-turn lanes and one right-turn lane. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Modifying the southbound Eastgate Mall approach to have two left-turn lanes and one right-turn lane is recommended under these alternatives. Planned protected bicycle lanes would need to be included on Eastgate Mall. Additional roadway width to accommodate the bicycle facilities and turn lanes would require property acquisition from an adjacent vacant land. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure. This improvement project is not identified in the University PFFP and would be added under each of these alternatives.

Miramar Road & Camino Santa Fe (Intersection 37):

- Alternatives A, B, C and D when compared to Existing Conditions: Construct a fourth eastbound and westbound through lane along Miramar Road, re-stripe the southbound leg to have a left-turn lane, shared left-through-right, and two exclusive rights, and maintain a right-turn overlap. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Constructing a fourth eastbound and westbound through lane along Miramar Road is not recommended under these alternatives. This would require removing existing Class II bicycle lanes, which would result in impacts to non-vehicular modes of travel. Re-stripe the southbound leg to have a left-turn lane, shared left-through-right, and two exclusive rights, and maintain a right-turn overlap is not recommended. Triple right-turn movements can be a safety concern and typically are used only in special circumstances. As a result, the significant traffic impacts to this intersection would remain significant and unmitigated. This improvement project is not identified in the University PFFP and would not be added for any of these alternatives.

Nobel Drive & La Jolla Village Square Driveway (Intersection 39):

- Alternatives A, B, C and D when compared to Existing Conditions: Construct a second northbound right-turn lane from La Jolla Village Square to Nobel Drive and a third westbound left-turn lane from Nobel Drive to La Jolla Village Square. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Constructing a second northbound right-turn lane from La Jolla Village Square to Nobel Drive and a third westbound left-turn lane from Nobel Drive to La Jolla Village Square is not recommended under these alternatives. Increased intensity of the land uses south of this intersection should rely on the new transit center and supporting transit investments being made to get people to and from this area instead of widening roadways to accommodate additional personal vehicles. Further, widening of the northbound approach increases pedestrian crossing distances, which would result in impacts to non-vehicular modes of travel. As a result, the significant traffic impacts to this intersection would remain significant and unmitigated. If the shopping center redevelops, improvements could be made to this intersection at that time. This improvement project is not identified in the University PFFP and would not be added for any of these alternatives.

Nobel Drive & I-5 Southbound On-Ramp (Intersection 40):

- Alternatives A, B, C and D when compared to Existing Conditions: Construct an exclusive eastbound right-turn lane on Nobel Drive. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Constructing an exclusive eastbound right-turn lane on Nobel Drive is not recommended under these alternatives.

The addition of the right-turn lane would require property acquisition and would affect the parking and circulation of the adjacent private retail use. Property acquisition, however, is considered environmentally, financially, and socially infeasible. As a result, the significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would remain significant and unmitigated. This improvement project is not identified in the University PFFP and would not be added for any of these alternatives.

Nobel Drive & Regents Road (Intersection 44):

- Alternatives A, B, C and D when compared to Existing Conditions: Restripe to add a third westbound through lane on Nobel Drive, add an eastbound right-turn lane on Nobel Drive, and remove the pedestrian crossing on the east leg. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Restriping to add a third westbound through lane on Nobel Drive is not recommended under these alternatives, as it precludes implementation of planned bicycle lanes on Nobel Drive. This would result in impacts to non-vehicular modes of travel. Addition of an eastbound right-turn lane on Nobel Drive is not recommended under these alternatives as the widening to add the lane would impact the pedestrian facilities. There is not adequate width available to widen for the right-turn lane and maintain the existing sidewalk width. Remove the pedestrian crossing on the east leg is not recommended under these alternatives as it would remove pedestrian connectivity options. As a result, the significant traffic impacts to this intersection would remain significant and unmitigated. This improvement project is not identified in the University PFFP and would not be added for any of these alternatives.

Regents Road & Arriba Street (Intersection 59):

- Alternatives A and B when compared to Existing Conditions: Construct a second northbound left-turn lane on Regents Road. The significant traffic impact, associated with Alternatives A and B, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A and B Recommended Improvements: Constructing a second northbound left-turn lane on Regents Road is recommended under these alternatives. There is adequate width to add a second left-turn lane without widening the curb-to-curb width of the roadway by re-striping and/or modify the median on Regents Road. The significant traffic impact, associated with Alternatives A and B, to this roadway intersection would be fully mitigated with the implementation of this measure. This improvement project is not identified in the University PFFP and would be added under both of these alternatives.

Regents Road & Governor Drive (Intersection 60):

- Alternatives A and B when compared to Existing Conditions: Construct a second southbound left-turn lane on Regents Road and add a second westbound left-turn lane on Governor Drive. The significant traffic impact, associated with Alternatives A and B, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A and B Recommended Improvements: Constructing a second southbound left-turn lane on Regents Road and adding a second westbound left-turn lane on Governor Drive is recommended under these alternatives. The additional turn lanes would require widening of Regents Road and Governor Drive to accommodate the new lanes and maintain existing and planned bicycle facilities. This improvement is necessary to maintain acceptable operations at the first intersection south of the newly constructed Regents Road Bridge under these alternatives. The significant traffic impact, associated with Alternatives A and B, to this roadway intersection would be fully mitigated with the implementation of this measure. This improvement project is not identified in the University PFFP and would be added under both of these alternatives.

Regents Road & Luna Avenue (Intersection 63):

- Alternatives A, B, C and D when compared to Existing Conditions: Construct a third northbound and southbound through lane on Regents Road / Clairemont Mesa Boulevard. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Constructing a third northbound and southbound through lane on Regents Road / Clairemont Mesa Boulevard is not recommended under these alternatives because it is outside of the community boundary. As a result, the significant traffic impacts to this intersection would remain significant and unmitigated. This intersection is outside of the University community and no project would be included in the University PFFP for any of these alternatives.

North Torrey Pines Road & La Jolla Shores Drive (Intersection 66):

- Alternatives A, B, C and D when compared to Existing Conditions: Restripe to add a third southbound through lane on North Torrey Pines Road, modify eastbound and westbound La Jolla Shores Drive approaches to utilize "protected left-turn" phasing instead of "split phasing" in the traffic signal, and remove the pedestrian crossing on the north leg. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Restriping to add a third southbound through lane on North Torrey Pines Road is not recommended under these alternatives because it would remove existing bicycle lane on North Torrey Pines Road. Modifying eastbound and westbound La Jolla Shores Drive approaches to utilize "protected left-turn" phasing instead of "split phasing" in the traffic signal, and removing the pedestrian crossing on the north leg is not recommended as part of the University Community Plan Amendment because it impacts the pedestrian connectivity. As a result, the significant traffic impacts to this intersection would remain significant and unmitigated. This improvement project is not identified in the University PFFP and would not be added for any of these alternatives.

Gilman Drive & I-5 Southbound Ramps (Intersection 69):

- Alternatives A, B, C and D when compared to Existing Conditions: There are no significant impacts at this intersection when compared to existing conditions.

- Alternatives C and D Recommended Improvements: To improve operations to acceptable conditions during all peak periods, converting one westbound through lane to a left-turn lane, creating dual left-turns at this intersection. This improvement project is not identified in the University PFFP and would be added for either of these alternatives.

Towne Center Drive & Eastgate Mall (Intersection 73):

- Alternatives A, B, C and D when compared to Existing Conditions: Construct a second westbound left-turn lane from Eastgate Mall to Towne Centre Drive. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Constructing a second westbound left-turn lane from Eastgate Mall to Towne Centre Drive is recommended under these alternatives. There is adequate width to add a second left-turn lane without widening the curb-to-curb width of the roadway by re-striping and/or modify the median on Eastgate Mall. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure. This improvement project is not identified in the University PFFP and would be added under each of these alternatives.

Executive Way & Executive Drive (Intersection 76):

- Alternatives A, B, C and D when compared to Existing Conditions: Traffic signal modification for eastbound and westbound left-turns to be "protected-permissive" instead of "permissive". The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Traffic signal modification for eastbound and westbound left-turns to be "protected-permissive" instead of "permissive" is recommended under these alternatives. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure. This traffic signal improvement project is not identified in the University PFFP and would be added under each of these alternatives.

Judicial Drive & Eastgate Mall (Intersection 77):

- Alternatives A, B, C and D when compared to Existing Conditions: Traffic signal modification for northbound and southbound approach of Judicial Drive to be "split-phased" in the traffic signal, and re-stripe the northbound approach to have a left-turn lane, shared left-through-right lane, and right-turn lane. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Traffic signal modification for northbound and southbound approach of Judicial Drive to be "split-phased" in the traffic signal, and re-striping the northbound approach to have a left-turn lane, shared left-through-right lane, and right-turn lane is recommended under these alternatives. The

significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure. This traffic signal improvement project is not identified in the University PFFP and would be added under each of these alternatives.

Governor Drive and I-805 Northbound Ramps (Intersection 79):

- Alternatives A, B, C and D when compared to Existing Conditions: Install roundabout control at this roadway intersection. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Installing roundabout control at this roadway intersection is recommended under these alternatives. A roundabout would fit within the intersection width and provide efficient flow based on the volumes and traffic patterns at this location. Caltrans continues to support alternatives besides signalizing intersections. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure. Install roundabout control at this roadway intersection is not identified in the University PFFP and would not be added under these alternatives since it's a State facility under Caltrans District 11 jurisdiction.

SEGMENTS

This section identifies required mitigation measures for roadway facilities that would be significantly impacted under Alternatives A, B, C and D when compared to Existing Conditions (Plan to Ground). For comparison purposes between alternatives, Appendix N was created to show differences for each alternative when compared to the current plan recommendations evaluated as Alternative A.

Eastgate Mall from Genesee Avenue to Easter Way:

- Alternatives A, B, and D when compared to Existing Conditions: Widen the roadway to a 4-lane Major. The significant traffic impact, associated with Alternatives A, B and D, to this roadway segment would be fully mitigated with the implementation of this measure.

- Alternatives A, B, and D Recommended Improvements: Widening the roadway to a 4-lane Major is not recommended as part of the University Community Plan Amendment under these alternatives. Removal of the continuous two way left turn lane to provide a raised center median for the purpose of bringing this roadway to four lane major street standards would impact ingress and egress of several existing driveways on both sides of the street. Nevertheless, the intersection of Eastgate Mall with Genesee Avenue operates at an acceptable LOS. Furthermore, with the improvements recommended at the intersection of Eastgate Mall and Towne Centre Drive that entail adding a second westbound left-turn lane from Eastgate Mall to Towne Centre Drive, this intersection will also operate at acceptable LOS. Therefore, the impact at this location is determined to be less than significant and no mitigation is required. This improvement project is not identified in the University PFFP and would not be added for any of these alternatives.

Eastgate Mall from Judicial Drive to Eastgate Drive (Freeway Overpass):

- Alternatives A, B, C and D when compared to Existing Conditions: Widen the roadway to a 4-lane Collector with a continuous left-turn lane. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway segment would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Widening the roadway to a 4-lane Collector with a continuous left-turn lane, excluding widening the bridge over Interstate 805 (I-805), and additional right-of way to accommodate bicycle facilities is recommended under these alternatives. With the recommended improvements, the significant traffic impact, associated with Alternatives A, B, C and D, would be fully mitigated with the implementation of this measure. This improvement project is identified in the University FBA (NUC-34) and would remain in the University FBA.

Eastgate Mall from Eastgate Drive to Miramar Road:

- Alternatives A, B, C and D when compared to Existing Conditions: Widen the roadway to a 4-lane Collector with a continuous left-turn lane. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway segment would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Widening the roadway to a 4-lane Collector with a continuous left-turn lane and additional right-of way to accommodate protected bicycle facilities is recommended under these alternatives. With the recommended improvements, the significant traffic impact, associated with Alternatives A, B, C and D, to this roadway segment would be fully mitigated with the implementation of this measure. This improvement project is identified in the University FBA (NUC-34) and would be updated to extend to Miramar Road.

Genesee Avenue from La Jolla Village Drive to Esplanade Court:

- Alternatives C and D when compared to Existing Conditions: Repurpose the right-of-way to provide for a 6-lane Prime arterial with Class II bike facility with buffers. The significant traffic impact, associated with Alternatives C and D, to this roadway segment would be fully mitigated with the implementation of this measure.

- Alternatives C and D Recommended Improvements: Repurposing the right-of-way to provide for a 6-lane Prime arterial with Class II bike facility with buffers is recommended as part of the University Community Plan Amendment under these alternatives. With the recommended improvements, the significant traffic impact, associated with Alternatives C and D, to this roadway segment would be fully mitigated with the implementation of this measure.

Genesee Avenue from Nobel Drive to Centurion Square (4-Lane Major Arterial):

- Alternative B and D when compared to Existing Conditions: Repurpose the right-of way to provide a modified 6 lane major between Nobel Drive and Decoro Street and modified 6 lane prime between Decoro Street and Centurion Square with bicycle facilities that include a shared pedestrian-bicycle facility accommodated on widened sidewalks or Class II bicycle

facility as right-of-way permits. The significant traffic impact, associated with this Alternative, to this roadway segment would be fully mitigated with the implementation of this measure.

- Alternative B and D Recommended Improvements: Repurposing the right-of way to provide a modified 6 lane major between Nobel Drive and Decoro Street and modified 6 lane prime between Decoro Street and Centurion Square with bicycle facilities that include a shared pedestrian-bicycle facility accommodated on widened sidewalks or Class II bicycle facility as right-of-way permits is recommended under this alternative. The modified design along this segment includes maintaining existing curb to curb width, reducing median width, restriping and widening sidewalks where right-of way permits to accommodate shared bike and pedestrian facility. As a result, significant traffic impact to Genesee Avenue from Nobel Drive to Centurion Square would be fully mitigated. The existing University FBA (NUC-A) project would be modified.

Genesee Avenue from Nobel Drive to Centurion Square (6-Lane Major Arterial):

- Alternative C when compared to Existing Conditions: Widen to an 8-lane Prime arterial. The significant traffic impact, associated with Alternative C, to this roadway segment would be fully mitigated with the implementation of this measure. Another option is to repurpose the existing right-of-way for the segment between Decoro Street and Centurion Square to provide a modified 6 lane prime and widening the segment from Nobel Drive and Decoro Street to provide 8 lane prime.

  Alternative C Recommended Improvements: Widening to an 8-lane Prime arterial or repurposing to a 6-lane Prime is not recommended under this alternative. There is not sufficient width to accommodate driveway acceleration and deceleration lanes when converting to a 6-lane Prime arterial facility or to widen the roadway to provide an 8-lane Prime arterial facility without several property acquisitions. Roadway widening would involve the expansion of current right-of-way through additional property acquisition. Property acquisitions, however, are considered environmentally, financially, and socially infeasible. As a result, the significant traffic impacts to this roadway segment would remain significant and unmitigated. The existing University FBA (NUC-A) project would be modified to repurpose the existing right-of-way to provide a modified 6 lane major between Nobel Drive and Centurion Square with bike facilities that include a shared pedestrian bicycle facility accommodated on widened sidewalks or Class II bicycle facility as right-of-way permits.

Genesee Avenue from Centurion Square to Governor Drive (4-Lane Major Arterial):

- Alternative B and D when compared to Existing Conditions: Repurpose the right-of way to provide a modified 6 lane major with bicycle facilities that include a shared pedestrian-bicycle facility accommodated on widened sidewalks or Class II bicycle facility as right-of-way permits. The significant traffic impact, associated with Alternative B, would be fully mitigated with the implementation of these measures.

- Alternative B and D Recommended Improvements: Repurposing the right-of way to provide a modified 6 lane major with bike facilities that include a shared pedestrian bicycle facility

accommodated on widened sidewalks or Class II bicycle facility as right-of-way permits is recommended under this alternative. The modified design along this segment includes maintaining existing curb to curb width, reducing median width, restriping and widening sidewalks where Right-of way permits to accommodate shared bike and pedestrian facility. The significant traffic impact, associated with Alternative B, to this roadway segment would be fully mitigated with the implementation of this measure. The existing University FBA (NUC-A) project would be modified.

Genesee Avenue from Centurion Square to Governor Drive (6-Lane Major Arterial):

- Alternative C when compared to Existing Conditions: Widen to an 8-lane Prime arterial. The significant traffic impact, associated with Alternative C, to this roadway segment would be fully mitigated with the implementation of this measure.

- Alternative C Recommended Improvements: Widening to an 8-lane Prime arterial is not recommended under these alternatives. There is not sufficient width to provide an 8-lane Prime arterial facility without several property acquisitions. Roadway widening would involve the expansion of current right-of-way through additional property acquisition. Property acquisitions, however, are considered environmentally, financially, and socially infeasible. As a result, the significant traffic impacts to this intersection would remain significant and unmitigated. Implementing NUC-A project currently included in University FBA is recommended and included as a baseline condition for this alternative; therefore, would still be included in the University FBA.

Genesee Avenue from Governor Drive to SR-52 Westbound Ramps (4-Lane Major Arterial):

- Alternative B and D when compared to Existing Conditions: Repurpose the right-of way to provide a modified 6 lane major with bike facilities that include a shared pedestrian bicycle facility accommodated on widened sidewalks or Class II bicycle facility as right-of-way permits. The significant traffic impact, associated with Alternative B, would be partially mitigated with the implementation of these measures.

- Alternative B and D Recommended Improvements: Repurposing the right-of way to provide a modified 6 lane major with bike facilities that include a shared pedestrian bicycle facility accommodated on widened sidewalks or Class II bicycle facility as right-of-way permits is recommended under this alternative. The modified design along this segment includes maintaining existing curb to curb width, reducing median width, restriping and widening sidewalks where Right-of way permits to accommodate shared bike and pedestrian facility. The significant traffic impact, associated with Alternative B, to this roadway segment would be partially mitigated with the implementation of this measure. The existing University FBA (NUC-A) project would be modified.

Genesee Avenue from Governor Drive to SR-52 Westbound Ramps (6-Lane Major Arterial):

- Alternative A and C when compared to Existing Conditions: Repurpose the right-of-way to a 6-lane Prime arterial. The significant traffic impact, associated with Alternative A, to this roadway segment would be fully mitigated with the implementation of this measure.

- Alternative A and C Recommended Improvements: Repurpose the right-of-way to a 6-lane Prime arterial is not recommended under these alternatives. There is not adequate width to accommodate driveway acceleration and deceleration lanes along this segment when converting to a 6-lane Prime arterial facility without several property acquisitions. Roadway widening would involve the expansion of current right-of-way through additional property acquisition. Property acquisitions, however, are considered environmentally, financially, and socially infeasible. As a result, the significant traffic impacts to this intersection would remain significant and unmitigated. Implementing NUC-A project currently included in University FBA is recommended and included as a baseline condition for this alternative; therefore, would still be included in the University FBA.

Genesee Avenue from SR-52 Westbound Ramps to SR-52 Eastbound Ramps:

- Alternatives A, B, C and D when compared to Existing Conditions: Repurpose the right-of way to provide a modified 6 lane major with bike facilities that include a shared pedestrian bicycle facility accommodated on widened sidewalks or Class II bicycle facility as right-of-way permits. The significant traffic impact, associated with these Alternatives, would be fully mitigated with the implementation of these measures.

- Alternatives A, B, C and D Recommended Improvements: Repurposing the right-of way to provide a modified 6 lane major with bike facilities that include a shared pedestrian bicycle facility accommodated on widened sidewalks or Class II bicycle facility as right-of-way permits is not recommended under this alternative because it is outside of the community boundary. As a result, the significant traffic impacts to this intersection would remain significant and unmitigated. This roadway segment is outside of the University Community Planning Area and no project would be included in the University PFFP for any of these alternatives.

Genesee Avenue from SR-52 Eastbound Ramps to Lehrer Drive:

- Alternatives A, B, C and D when compared to Existing Conditions: Widen and repurpose the roadway to a 6-lane Major. The significant traffic impact, associated with Alternatives A, B, C and D, to this roadway intersection would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Widen and repurpose the roadway to a modified 6-lane Major is not recommended under this alternative because it is outside of the community boundary. As a result, the significant traffic impacts to this intersection would remain significant and unmitigated. This roadway segment is outside of the University Community Planning Area and no project would be included in the University PFFP for any of these alternatives.

La Jolla Village Drive from Revelle College Drive to Villa La Jolla Drive:

- Alternatives C and D when compared to Existing Conditions: Widen to an 8-lane Prime Arterial. The significant traffic impact, associated with Alternatives C and D, to this roadway segment would be fully mitigated with the implementation of this measure.

- Alternatives C and D Recommended Improvements: Widen to an 8-lane Prime Arterial is not recommended as part of the University Community Plan Amendment under these alternatives. To provide an 8-lane Prime arterial facility would require widening of La Jolla Village Drive between Revelle College Drive and Villa La Jolla Drive, including modifying the La Jolla Village Drive urban interchange with Gilman Drive and the pedestrian bridge just west of Villa La Jolla Drive. Roadway widening would involve the expansion of current right-of-way through additional property acquisition. Property acquisitions, however, are considered environmentally, financially, and socially infeasible. Property acquisitions would require demolition of existing buildings which would generate additional environmental impacts associated with air quality, noise, GHGs, solid waste, and traffic as well as continuing to promote vehicular usage. Additionally widening of the roadway would require reconstruction of the pedestrian bridge located 250 feet west of the intersection of La Jolla Village Drive with Villa La Jolla Drive and increase the pedestrian crossing distance at intersections. As a result, the significant traffic impacts to this intersection would remain significant and unmitigated. Widening the roadway to an 8-lane Prime arterial is not identified in the University PFFP and would not be added for any of these alternatives.

La Jolla Village Drive from Villa La Jolla Drive to I-5 Northbound Ramps:

- Alternatives A, B, C and D when compared to Existing Conditions: Widen to an 8-lane Prime. The significant traffic impact, associated with all studied alternatives, to this roadway segment would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Widen to an 8-lane Prime Arterial is not recommended as part of the University Community Plan Amendment under these alternatives. Roadway widening would involve the expansion of current right-of-way through additional property acquisition. Property acquisitions, however, are considered environmentally, financially, and socially infeasible. This would also require widening of the overpass and reconfiguration of the interchange to add an additional westbound lane. As a result, the significant traffic impacts to this intersection would remain significant and unmitigated. Widening the roadway to an 8-lane Prime arterial is not identified in the University PFFP and would not be added for any of these alternatives.

La Jolla Village Drive from I-5 Northbound Ramps to Towne Centre Drive:

- Alternatives A, B, C and D when compared to Existing Conditions: Repurpose to a 6-lane Prime. The significant traffic impact, associated with all studied alternatives, to this roadway segment would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Repurposing to a 6-lane Prime is recommended as part of the University Community Plan Amendment under these alternatives. Repurposing entails removal of on street parking and providing acceleration and deceleration lanes at existing driveways. The significant traffic impact, associated with all studied alternatives, to this roadway segment would be fully mitigated with the implementation of this measure. Repurposing to a 6-lane Prime arterial is not identified in the University PFFP and would be added under these alternatives.

Miramar Road from Miramar Mall to Camino Santa Fe:

- Alternatives A, B, C and D when compared to Existing Conditions: Widen to an 8-lane Prime. The significant traffic impact, associated with all studied alternatives, to this roadway segment would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Widen to an 8-lane Prime is not recommended as part of the University Community Plan Amendment under these alternatives. Roadway widening would involve the expansion of current right-of-way through additional property acquisition. Property acquisitions, however, are considered environmentally, financially, and socially infeasible. Another option is removal of existing Class II bicycle lanes, which would result in impacts to non-vehicular modes of travel. As a result, the significant traffic impacts to this intersection would remain significant and unmitigated. This improvement project is not identified in the University PFFP and would not be added for any of these alternatives.

Nobel Drive from Villa La Jolla Drive to I-5 Southbound On-Ramp:

- Alternatives A, B, C and D when compared to Existing Conditions: Widen to a 6-lane Prime. The significant traffic impact, associated with all studied alternatives, to this roadway segment would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Widen to a 6-lane Prime is not recommended under these alternatives. To provide a 6-lane Prime arterial facility would require property acquisition from the adjacent private retail center and would have an impact to existing bicycle lanes and pedestrian crossing distances. Roadway widening would involve the expansion of current right-of-way through additional property acquisition. Property acquisitions, however, are considered environmentally, financially, and socially infeasible. As a result, the significant traffic impacts to this roadway segment would remain significant and unmitigated. This improvement project is not identified in the University PFFP and would not be added for any of these alternatives.

Nobel Drive from I-5 Southbound On-Ramp to I-5 Northbound Off-Ramp/University Center Lane:

- Alternatives A, B, C, and D when compared to Existing Conditions: Widen to a 6-lane Major. The significant traffic impact, associated with all studied alternatives, to this roadway segment would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C, and D Recommended Improvements: Widening to a 6-lane Major is not recommended as part of the University Community Plan Amendment under these alternatives. This improvement would require widening of the Nobel Drive which would impact the layout of the Mid-Coast station at southwest corner of the intersection of Nobel Drive with the I-5 Southbound on-ramp. Additionally, widening of the roadway would increase pedestrian crossing distance to the proposed Mid-Coast station just west of the I-5 freeway. As a result, the significant traffic impacts to this intersection would remain significant and unmitigated. This improvement project is not identified in the University PFFP and would not be added for any of these alternatives.

Regents Road from SR-52 Westbound Ramps to SR-52 Eastbound Ramps:

- Alternatives A and B when compared to Existing Conditions: Widen to a 6-lane Major. The significant traffic impact, associated with Alternatives A and B, to this roadway segment would be fully mitigated with the implementation of this measure.

- Alternatives A and B Recommended Improvements: Widen to a 6-lane Major is not recommended under these alternatives. Widening this section would require modifications to two overpasses of SR-52. The roadway is currently built to its ultimate classification and intersections on either end operate at acceptable conditions. The impact at this location is determined to be less than significant and no mitigation is required. This improvement project is not identified in the University PFFP and would not be added for any of these alternatives.

Regents Road from SR-52 Eastbound Ramps to Luna Avenue:

- Alternatives A and B when compared to Existing Conditions: Widen to a 6-lane Major. The significant traffic impact, associated with Alternatives A and B, to this roadway segment would be fully mitigated with the implementation of this measure.

- Alternatives A and B Recommended Improvements: Widen to a 6-lane Major is not recommended as part of the University Community Plan Amendment under this alternative. This roadway is located outside of the University community boundary and is currently built to its ultimate classification per the Clairemont Mesa Community Plan. As a result, the significant traffic impacts to this intersection would remain significant and unmitigated. This roadway segment is outside of the University community and no project would be included in the University PFFP for any of these alternatives.

Torrey Pines Road from La Jolla Village Drive to Community Boundary:

- Alternatives A, B, C and D when compared to Existing Conditions: Widen to a 6-lane Major. The significant traffic impact, associated with all studied alternatives, to this roadway segment would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Widen to a 6-lane Major is not recommended under these alternatives. There is not sufficient width to provide a 6-lane Major facility without several property acquisitions. Roadway widening would involve the expansion of current right-of-way through additional property acquisition. Property acquisitions, however, are considered environmentally, financially, and socially infeasible. As a result, the significant traffic impacts to this intersection would remain significant and unmitigated. Widening to a 6-lane Major arterial is not identified in the University PFFP and would not be added for any of these alternatives.

CORRIDORS

Genesee Avenue between SR-52 and North Torrey Pines Road

- Alternatives A, B, C and D when compared to Existing Conditions: Improve intersection delay at key intersections along the corridor by implementing additional lanes and adaptive

traffic control and transit signal priority measures. The significant traffic impact, associated with all studied alternatives, to this corridor would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Improvements at key intersections along the corridor by implementing additional lanes and adaptive traffic control and transit signal priority measures are recommended under these alternatives. These measures would improve the quality of traffic flow based on demand; thereby, reducing traffic delays. Further, intersection mitigations at select locations along Genesee Avenue identified under the intersection analysis would provide mitigation. The significant traffic impact, associated with all studied alternatives, to this corridor would be mitigated with the implementation of these measures. No specific improvement project is identified for corridor improvements in the University PFFP. Implementation of adaptive traffic control and transit signal priority measures would be added for these alternatives.

La Jolla Village Drive between Torrey Pines Road and Interstate 805

- Alternatives A, B, C and D when compared to Existing Conditions: Improve intersection delay at key intersections along the corridor by implementing additional lanes and adaptive traffic control and transit signal priority measures. The significant traffic impact, associated with all studied alternatives, to this corridor would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Improvements at key intersections along the corridor by implementing additional lanes and adaptive traffic control and transit signal priority measures are recommended under these alternatives. These measures would improve the quality of traffic flow based on demand; thereby, reducing traffic delays. Further, intersection mitigations at select locations along La Jolla Village Drive identified under the intersection analysis would provide mitigation. The significant traffic impact, associated with all studied alternatives, to this corridor would be mitigated with the implementation of these measures. No specific improvement project is identified for corridor improvements in the University PFFP. Implementation of adaptive traffic control and transit signal priority measures would be added for these alternatives.

Nobel Drive between La Jolla Village Square and Miramar Road

- Alternatives A, B, C and D when compared to Existing Conditions: Improve intersection delay at key intersections along the corridor by implementing additional lanes and adaptive traffic control and transit signal priority measures. The significant traffic impact, associated with all studied alternatives, to this corridor would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C and D Recommended Improvements: Improvements at key intersections along the corridor by implementing additional lanes and adaptive traffic control and transit signal priority measures are recommended under these alternatives. These measures would improve the quality of traffic flow based on demand; thereby, reducing traffic delays. Further, intersection mitigations at select locations along Nobel Drive identified under the intersection analysis would provide mitigation. The significant

traffic impact, associated with all studied alternatives, to this corridor would be mitigated with the implementation of these measures. No specific improvement project is identified for corridor improvements in the University PFFP. Implementation of adaptive traffic control and transit signal priority measures would be added for these alternatives.

Regents Road between Luna Avenue and Genesee Avenue

- Alternatives A and B when compared to Existing Conditions: Improve intersection operation at key intersections along the corridor by implementing adaptive traffic control and transit signal priority measures. The significant traffic impact, associated with all studied alternatives, to this corridor would be fully mitigated with the implementation of this measure.

- Alternatives A and B Recommended Improvements: Improvements at key intersections along the corridor by implementing adaptive traffic control and transit signal priority measures are recommended under these alternatives. These measures would improve the quality of traffic flow based on demand; thereby, reducing traffic delays. Further, intersection mitigations at select locations along Regents Road identified under the intersection analysis would provide mitigation. The significant traffic impact, associated with all studied alternatives, to this corridor would be mitigated with the implementation of these measures. No specific improvement project is identified for corridor improvements in the University PFFP. Implementation of adaptive traffic control and transit signal priority measures would be added for these alternatives.

FREEWAY

Interstate 5, between SR-52 and Gilman Drive

- Alternatives A, B, C, and D when compared to Existing Conditions: Widen Interstate 5 to have five lanes in each direction. The significant traffic impact, associated with these alternatives, to this freeway segment would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C, and D Recommended Improvements: SANDAG's 2050 Revenue Constrained RTP includes addition of managed lanes on Interstate 5 between Interstate 8 and La Jolla Village Drive. This measure provides partial mitigation since it improves freeway operation in the vicinity of the project. As a result, the significant traffic impacts to this freeway segment would remain significant and unmitigated. This improvement is an improvement identified in the SANDAG RTP and would not be included in the University PFFP.

Interstate 805, between SR-52 and Mira Mesa Boulevard

- Alternatives A, B, C, and D when compared to Existing Conditions: Widen Interstate 805 to have five lanes in each direction. The significant traffic impact, associated with these alternatives, to this freeway segment would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C, and D Recommended Improvements: SANDAG's 2050 Unconstrained Network RTP includes addition of managed lanes on Interstate 805 between State Route 905 and Carrol Canyon Road. This measure provides partial mitigation since it improves freeway operation in the vicinity of the project. As a result, the significant traffic impacts to this freeway segment would remain significant and unmitigated. This improvement is an improvement identified in the SANDAG RTP and would not be included in the University PFFP.

State Route 52, between I-5 and I-805

- Alternatives A, B, C, and D when compared to Existing Conditions: Widen State Route 52 to have three lanes in each direction. The significant traffic impact, associated with these alternatives, to this freeway segment would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C, and D Recommended Improvements: SANDAG's 2050 Revenue Constrained RTP includes addition of a third lane in each direction along SR-52 between I-5 and I-805. The significant traffic impact, associated with these alternatives, to this freeway segment would be fully mitigated with the implementation of this measure. However, there is no funding in place to guarantee the improvement would be completed. As a result, the significant traffic impacts to this freeway segment would remain significant and unmitigated. This improvement is an improvement identified in the SANDAG RTP and would not be included in the University PFFP.

Interstate 5 Southbound Entrance Ramp from Gilman Drive

- Alternatives A, B, C, and D when compared to Existing Conditions: Adjust ramp meter rate to process more vehicles. The significant traffic impact, associated with these alternatives, to this freeway ramp would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C, and D Recommended Improvements: Caltrans continually monitors and adjusts freeway entrance ramp meter rates. Ramp meter rates are generally only increased to process more vehicles when freeways have the capacity to handle increased demand from the entrance ramps. SANDAG's 2050 Revenue Constrained RTP includes addition of managed lanes on Interstate 5 between Interstate 8 and La Jolla Village Drive. This measure provides partial mitigation since it improves freeway operation in the vicinity of the project. As a result, the significant traffic impacts to this freeway segment would remain significant and unmitigated. This improvement is an operational improvement made by Caltrans and would not be included in the University PFFP.

Interstate 5 Southbound Entrance Ramp from Nobel Drive

- Alternatives A, B, C, and D when compared to Existing Conditions: Adjust ramp meter rate to process more vehicles. The significant traffic impact, associated with these alternatives, to this freeway ramp would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C, and D Recommended Improvements: Caltrans continually monitors and adjusts freeway entrance ramp meter rates. Ramp meter rates are generally only increased to process more vehicles when freeways have the capacity to handle increased

demand from the entrance ramps. SANDAG's 2050 Revenue Constrained RTP includes addition of managed lanes on Interstate 5 between Interstate 8 and La Jolla Village Drive. This measure provides partial mitigation since it improves freeway operation in the vicinity of the project. As a result, the significant traffic impacts to this freeway segment would remain significant and unmitigated. This improvement is an operational improvement made by Caltrans and would not be included in the University PFFP.

Interstate 5 Northbound Entrance Ramp from Westbound La Jolla Village Drive

- Alternatives A, B, C, and D when compared to Existing Conditions: Adjust ramp meter rate to process more vehicles. The significant traffic impact, associated with these alternatives, to this freeway ramp would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C, and D Recommended Improvements: Caltrans continually monitors and adjusts freeway entrance ramp meter rates. Ramp meter rates are generally only increased to process more vehicles when freeways have the capacity to handle increased demand from the entrance ramps. SANDAG's 2050 Revenue Constrained RTP includes addition of managed lanes on Interstate 5 between Interstate 8 and La Jolla Village Drive. This measure provides partial mitigation since it improves freeway operation in the vicinity of the project. As a result, the significant traffic impacts to this freeway segment would remain significant and unmitigated. This improvement is an operational improvement made by Caltrans and would not be included in the University PFFP.

Interstate 5 Northbound Entrance Ramp from Eastbound La Jolla Village Drive

- Alternatives A, B, C, and D when compared to Existing Conditions: Adjust ramp meter rate to process more vehicles. The significant traffic impact, associated with these alternatives, to this freeway ramp would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C, and D Recommended Improvements: Caltrans continually monitors and adjusts freeway entrance ramp meter rates. Ramp meter rates are generally only increased to process more vehicles when freeways have the capacity to handle increased demand from the entrance ramps. SANDAG's 2050 Revenue Constrained RTP includes addition of managed lanes on Interstate 5 between Interstate 8 and La Jolla Village Drive. This measure provides partial mitigation since it improves freeway operation in the vicinity of the project. As a result, the significant traffic impacts to this freeway segment would remain significant and unmitigated. This improvement is an operational improvement made by Caltrans and would not be included in the University PFFP.

Interstate 5 Southbound Entrance Ramp from Westbound La Jolla Village Drive

- Alternatives A, B, C, and D when compared to Existing Conditions: Adjust ramp meter rate to process more vehicles. The significant traffic impact, associated with these alternatives, to this freeway ramp would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C, and D Recommended Improvements: Caltrans continually monitors and adjusts freeway entrance ramp meter rates. Ramp meter rates are generally only increased to process more vehicles when freeways have the capacity to handle increased

demand from the entrance ramps. SANDAG's 2050 Revenue Constrained RTP includes addition of managed lanes on Interstate 5 between Interstate 8 and La Jolla Village Drive. This measure provides partial mitigation since it improves freeway operation in the vicinity of the project. As a result, the significant traffic impacts to this freeway segment would remain significant and unmitigated. This improvement is an operational improvement made by Caltrans and would not be included in the University PFFP.

Interstate 5 Southbound Entrance Ramp from Eastbound La Jolla Village Drive

- Alternatives A, B, C, and D when compared to Existing Conditions: Adjust ramp meter rate to process more vehicles. The significant traffic impact, associated with these alternatives, to this freeway ramp would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C, and D Recommended Improvements: Caltrans continually monitors and adjusts freeway entrance ramp meter rates. Ramp meter rates are generally only increased to process more vehicles when freeways have the capacity to handle increased demand from the entrance ramps. SANDAG's 2050 Revenue Constrained RTP includes addition of managed lanes on Interstate 5 between Interstate 8 and La Jolla Village Drive. This measure provides partial mitigation since it improves freeway operation in the vicinity of the project. As a result, the significant traffic impacts to this freeway segment would remain significant and unmitigated. This improvement is an operational improvement made by Caltrans and would not be included in the University PFFP.

Interstate 5 Northbound Entrance Ramp from Genesee Avenue

- Alternatives A, B, C, and D when compared to Existing Conditions: Adjust ramp meter rate to process more vehicles. The significant traffic impact, associated with these alternatives, to this freeway ramp would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C, and D Recommended Improvements: Caltrans continually monitors and adjusts freeway entrance ramp meter rates. Ramp meter rates are generally only increased to process more vehicles when freeways have the capacity to handle increased demand from the entrance ramps. SANDAG's 2050 Revenue Constrained RTP includes addition of managed lanes on Interstate 5 between Interstate 8 and La Jolla Village Drive. This measure provides partial mitigation since it improves freeway operation in the vicinity of the project. As a result, the significant traffic impacts to this freeway segment would remain significant and unmitigated. This improvement is an operational improvement made by Caltrans and would not be included in the University PFFP.

Interstate 805 Southbound Entrance Ramp from Nobel Drive

- Alternatives A, B, C, and D when compared to Existing Conditions: Adjust ramp meter rate to process more vehicles. The significant traffic impact, associated with these alternatives, to this freeway ramp would be fully mitigated with the implementation of this measure.

- Alternatives A, B, C, and D Recommended Improvements: Caltrans continually monitors and adjusts freeway entrance ramp meter rates. Ramp meter rates are generally only increased to process more vehicles when freeways have the capacity to handle increased

demand from the entrance ramps. SANDAG's 2050 Unconstrained Network RTP includes addition of managed lanes on Interstate 805 between State Route 905 and Carrol Canyon Road. This measure provides partial mitigation since it improves freeway operation in the vicinity of the project. As a result, the significant traffic impacts to this freeway segment would remain significant and unmitigated. This improvement is an operational improvement made by Caltrans and would not be included in the University PFFP.

Table 10-1 Intersections Recommended for Mitigation Measures

ID	Intersection	Alt A (Regents Bridge & 6-lane Genesee)	Alt B (Regents Bridge & 4-lane Genesee)	Alt C (No Regents Bridge & 6-lane Genesee)	Alt D (No Regents Bridge & 4-lane Genesee)
2	Genesee Ave & John Hopkins Dr (S)	X	X	X	X

11 POST-MITIGATION ANALYSIS

This section provides a description of the future community buildout conditions with the implementation of the traffic mitigation measures described in Chapter 10.

ROADWAY NETWORK

The final recommended roadway networks for each Alternative are provided in **Appendices A – D**.

INTERSECTIONS

Tables 11-1 through 11-4 display the LOS analysis results for the study intersections within the study area after the implementation of the mitigation measures described in Chapter 10. A separate table is prepared for each alternative. The number of intersections continuing to operate at unacceptable LOS during one or more peak periods after the implementation of the recommended mitigation measures is as follows:

Alternative A: 16 locations

Alternative B: 16 locations

Alternative C: 21 locations

Alternative D: 20 locations

Appendices G - J contain the peak-hour intersections LOS calculation worksheets.

ROADWAY SEGMENT VOLUME-BASED

Table 11-5 displays the LOS analysis results for the study roadway segments within the study area after the implementation of the mitigation measures described in Chapter 10. The number of locations continuing to operate at unacceptable LOS after the implementation of the recommended mitigation measures is as follows:

Alternative A: 16 locations

Alternative B: 15 locations

Alternative C: 16 locations

Alternative D: 18 locations

ROADWAY SEGMENT SPEED-BASED

Table 11-6 displays the LOS analysis results for the speed-based roadway segments evaluation for Alternatives A and B, which include the Regents Road Bridge, before and after the implementation of the mitigation measures described in Chapter 10. **Table 11-7** displays the LOS analysis results for the speed-based roadway segments evaluation for Alternatives C and D, which does not include the Regents Road Bridge, before and after the implementation of the mitigation measures described in Chapter 10. As shown in the tables, the speeds generally are increased along the corridors with the capacity improvements identified as mitigation to intersections and roadway segments. **Table 11-8** provides a summary showing which corridors operate at LOS E or F in at least one direction for each peak period by alternative.

Appendices G - J contain tables and graphs that summarize the travel time details along each corridor.

Table 11-1 Intersection Analysis for Alternative A Recommended Network

ID	Intersection	Peak Hour	Future Alt A - *Before Improvement*			Future Alt A - *After Recommended Improvement*			Description

Notes:

Bold values indicate intersections operating at LOS E or F.

(a) Delay refers to the average control delay for the entire intersection, measured in seconds per vehicle. At a two-way stop-controlled intersection, delay refers to the worst movement.

(b) LOS calculations are based on the methodology outlined in the *2010 Highway Capacity Manual* and performed using Synchro 9.0

Notes:

Bold values indicate intersections operating at LOS E or F.

(a) Delay refers to the average control delay for the entire intersection, measured in seconds per vehicle. At a two-way stop-controlled intersection, delay refers to the worst movement.

(b) LOS calculations are based on the methodology outlined in the *2010 Highway Capacity Manual* and performed using Synchro 9.0

Notes:

Bold values indicate roadway segments operating at LOS E or F.

(a) Road classifications are based on _____

(b) Average Daily Traffic (ADT) volumes for the roadway segments were determined from SANDAG Modeling

(c) The v/c Ratio is calculated by dividing the ADT volume by each respective roadway segment's capacity.

12 INTELLIGENT TRANSPORTATION SYSTEMS

Use of Intelligent Transportation Systems (ITS) can provide many benefits to a mobility network, including improving travel time, providing transit bypass methods, helping relay valuable traffic-related information to vehicular and non-vehicular users, and providing guidance to key destinations.

Coordinated traffic signals is an example of an ITS strategy that helps improve roadway operations, and can be found in the University community. Traffic signals have coordinated timing plans and information is relayed between traffic signals in real-time. The traffic signals typically communicate using underground copper or fiber optic wires. Having traffic signals coordinated helps to maximize the efficiency of the traffic signal system on that roadway. The following roadways within the study area currently have coordinated traffic signal timing plans that will need to be revisited on occasion to verify they continue to meet the traffic pattern demand:

- Genesee Avenue
- La Jolla Village Drive
- Miramar Road
- North Torrey Pines Road

In order to accommodate current and project traffic in the University community, Genesee Avenue and La Jolla Village Drive corridors should be considered for the application of adaptive traffic signal operations. An adaptive system along this corridor would be conducive to the fluctuations in traffic that occur throughout the day. Implementation of adaptive signal systems must be according to the City of San Diego requirements and will require communications upgrades between the traffic signals as well as implementation of the system at the controller cabinets.

For each of the four alternatives, coordinated traffic signals should be considered on Nobel Drive. With Alternatives A and B, it is recommended to coordinate signal timing along Regents Road once the bridge is constructed.

Transit signal priority is an ITS strategy that allows a public transit vehicle, such as an MTS bus, to send information to an upcoming traffic signal to activate advanced transitioning to a green signal for its approach. As part of the Superloop rapid bus route, a total of 40 intersection have transit signal priority. There are no other transit signal priority intersections currently within the University community and with the current transit system, no additional intersections are recommended to have TSP installed. The Superloop TSP should be maintained and the City should work with MTS to monitor if additional intersections would benefit as transit routes change.

As the transit network expands within the community, transit users would benefit from integrating real-time transit schedule updates at the transit stops. This allows the user to be informed of when the next vehicle will be coming to the stop so that they can manage their time accordingly. There are also opportunities to develop internet-based applications that can provide this information remotely.

13 TRANSPORTATION DEMAND MANAGEMENT

The goal of the City's Transportation Demand Management (TDM) program is to improve mobility, reduce congestion and air pollution, and provide options for employees and residents to commute to and from work. Typical TDM strategies include promoting teleworking, alternative work schedules, walking, bicycling, carpooling, vanpooling, transit, carsharing, mixed-use development, and other transportation options. TDM measures improve the efficiency of our transportation system by helping to reduce vehicle trips during peak periods of demand.

The City of San Diego's Municipal Code requires new development to provide sufficient bicycle parking stalls, carpool parking and motorcycle facilities to encourage the use of alternative modes of transportation. As new developments enter the community, TDM measures should be required. Examples of recent TDM measures requested for development in the community include:

- Partially (or fully) subsidize transit passes
- Provide bicycle lockers
- Provide on-site shower facilities
- Provide reserved parking spaces for carpool/vanpool/low emission vehicles
- Provide transit/carpool/vanpool information kiosks

The University community draws a lot of visitors from outside of the community for both work and retail destinations. The addition of the new light-rail transit system will improve connections with other communities in San Diego and help reduce the vehicle demand. Further, the planned managed lanes included in the 2050 RTP along Interstate 805 and Interstate 5 adjacent to the community will be available for carpools, vanpools, buses, and for single occupant drivers who pay a toll. The amount of carpooling activity is expected to increase as the system of high occupancy lanes and managed lanes increase in the region. Providing bicycle connections within the community and to the adjacent communities will also be important for reducing the vehicle demand within the community.

The combination of new development requirements that encourage TDM measures and providing realistic options for people to utilize alternative modes of travel will lead to successfully managing the vehicle demand in the University community.

14 EMERGENCY RESPONSE

The City of San Diego Fire Department provided information on existing response times specific to the area south of Rose Canyon, east of Interstate 5, west of Genesee Avenue, and north of State Route 52. Emergency vehicle access across Rose Canyon influences the potential response time to emergencies in this area. There are currently three fire stations in the vicinity that primarily serve this area:

- Station 35 is located at 4285 Eastgate Mall, near the intersection of Genesee Avenue and Eastgate Mall, within the community and north of Rose Canyon.

- Station 27 is located at 5064 Clairemont Drive, near the intersection of Clairemont Mesa Boulevard and Clairemont Drive, south of the community, south of State Route 52.

- Station 9 is located at 7870 Ardath Lane, near the intersection of La Jolla Parkway and Torrey Pines Road, west of the community, west of Interstate 5.

The Fire Department uses the 90th Percentile response time to measure their effectiveness of responding to emergencies. The goal is to achieve a response time to emergencies of 7.5 minutes, 90% of the time. This 7.5 minute goal includes a 1-minute dispatch time, 1.5-minute company turn-out time and 5–minute travel time. The current 90th percentile response time to this area is 9 minutes and 38 seconds. It does not meet the City's goal. As part of a City-wide evaluation of the emergency response times, a new fire station in this area was identified as a priority.

An analysis of future year response time differences between alternatives was performed as part of this report. When estimating future year travel times, an average travel time is identified but it is not possible to quantify a 90th percentile. Therefore, the evaluation compares existing average travel time with future average travel time.

Model outputs and existing response time information is provided in **Appendix M**.

Table 14-1 provides a summary of the average response times based on existing data and projected future travel times using the forecast models for each alternative. Each traffic analysis zone was evaluated separately for morning peak (3 hours), afternoon peak (3 hours), and off-peak (18 hours), and then a weighted average was calculated for the area. A default dispatch and turn-out time of 2.5 minutes was added to the future year travel time estimates to compare equally with the information provided for existing conditions, which included dispatch, turn-out, and travel time.

As shown in the table, the average response time increases regardless of the alternative selected. There is not a major difference between the alternatives when it comes to average response time. Since the Fire Department does not use average travel time as a quantifier when determining response time effectiveness, the comparison provides a measure of how travel times are anticipated to change between existing and future conditions but does not provide the detailed information to determine if response times would be met in accordance with the City's goals. However, based on the finding that average response times are expected to increase and existing response times are not currently meeting the City's goal response times, it can be concluded that regardless of the alternative selected, a new fire station would be beneficial to improve emergency response times in this area of the community.

Table 14-1 Emergency Response Time Evaluation Summary

TAZ	Station	Year 2014 and 2015 Actual Response Times, TOTAL TURN-OUT AND DRIVE TIME (minutes)	Year 2035 Modeled Response, DRIVE TIME + 2.5 TURNOUT (minutes)
