The City of
SAN DIEGO
Public Utilities Department

Environmental Monitoring & Technical Services Division

October 31, 2021

Mr. David W. Gibson, Executive Officer
California Regional Water Quality Control Board
San Diego Region
2375 Northside Drive, Suite 100
San Diego, CA 92108

Attention: POTW Compliance Unit

Dear Mr. Gibson:

Enclosed is the September 2021 Monthly Receiving Waters Monitoring Report for the Point Loma Ocean Outfall, Point Loma Wastewater Treatment Plant as required per Order No. R9-2017-0007, NPDES Permit No. CA0107409.

This report includes raw ocean monitoring data and summaries of water quality parameters and ocean conditions measured during the month for the Point Loma outfall region. Also included are summaries of compliance with the bacterial water-contact standards specified in the California Ocean Plan.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Peter S. Vroom, Ph.D.
Deputy Public Utilities Director

PV/rk

cc: U.S. Environmental Protection Agency, Region 9

INTRODUCTION

Monthly reports of water quality and ocean conditions for the San Diego coastal region surrounding the Point Loma Ocean Outfall are submitted to the San Diego Regional Water Quality Control Board and U.S. EPA Region 9 in accordance with Order No. R9-2017-0007, NPDES Permit No. CA0107409 for the Point Loma Wastewater Treatment Plant (PLWTP), Point Loma Ocean Outfall (PLOO). This report includes receiving waters monitoring data collected from all shore, kelp and offshore stations specified in the above order. Data for influent and effluent monitoring activities for the PLWTP are presented in separate reports.

MATERIALS AND METHODS

Shore Stations

Water quality conditions are required to be monitored at eight shoreline stations, including D4, D5, D7, D8, D9, D10, D11 and D12, which range from the tip of the Point Loma Peninsula to west of Mission Bay (see station locations map). Over the past several years, due to increasing instability in several cliffside areas of Point Loma, City staff have been unable to safely access and sample several stations at various times. This has resulted in the following modifications:

- Station D8 was replaced by alternate station D8-A during July 2016, which was subsequently replaced by station D8-B in March 2018, after which sampling at station D8-A resumed in December 2020. Due to recent access issues at D8-A, sampling resumed at D8-B during February 2021.

Seawater samples are collected from the surf zone at each station on a weekly basis. These samples are subsequently transported to the City's Marine Microbiology Laboratory and analyzed for the presence of several types of fecal indicator bacteria (FIB), including total coliforms, fecal coliforms, and *Enterococcus*. Visual observations of water color and clarity, surf height, human or animal activity, and weather conditions are also recorded at the time of sample collection. Wind speed and direction are measured using a hand-held anemometer with a compass.

Kelp Bed Stations

The eight kelp stations are sampled weekly according to permit specifications to monitor water quality conditions within the Point Loma kelp forest. These stations include three sites located along the inshore edge of the kelp bed paralleling the 9-m depth contour (i.e., stations C4, C5 and C6), and five sites located near the offshore edge of the kelp bed along the 18-m depth contour (i.e., stations A1, A6, A7, C7 and C8).

Routine weekly monitoring at each of the kelp bed sites consists primarily of collecting seawater samples at discrete depths to determine concentrations of fecal indicator bacteria (i.e., total coliforms, fecal coliforms, and *Enterococcus*). Water column profiles of various physical/chemical parameters are also generated during each sampling event, and visual observations of weather and water conditions are recorded at each station.

Seawater samples at the kelp bed stations are collected using a CTD-integrated rosette sampler with Niskin bottles. Aliquots for bacteriological analyses are drawn from these bottles into sterile sample bottles for processing at the City's Marine Microbiology Laboratory. Water column

profiles of temperature, transmissivity, dissolved oxygen, pH, salinity, density, chlorophyll *a* are generated using a Sea-Bird conductivity, temperature and depth instrument (CTD), which collects these data at a rate of ≥ 4 scans per second. These scans are then internally averaged to create water column profiles with data readings at a rate of one per meter. Additionally, CTD profile data for each water sample depth are presented with the bacteriological data.

Offshore Stations

Offshore water quality sampling is conducted quarterly typically during the months of February, May, August and November. A total of 36 offshore stations (F01–F36) are sampled during each survey usually over a 3-day period. Three of the stations (F01–F03) are located along the 18 m depth contour, while 11 stations are located along each of the following contours: 60 m (stations F04–F14), 80 m (stations F15–F25), and 98 m (stations F26–F36). Of these 36 stations, 15 (F01–F03, F06–F14, F18–F20) are located within State jurisdictional waters (i.e., within 3 nautical miles of shore) and are subject to the California Ocean Plan's compliance standards. Monitoring at all offshore sites includes measurements of *Enterococcus* bacteria, water temperature, salinity, density, dissolved oxygen, pH, chlorophyll *a*, transmissivity, chromomorphic dissolved organic matter (CDOM), and visual observations of weather and water conditions.

Seawater samples for bacteriological analyses at the offshore stations are collected using a CTD-integrated rosette sampler with Niskin bottles. Profiles of the various physical/chemical parameters (listed above) are taken using a Sea-Bird CTD. Additionally, data for depths closest to those at which bacteriological samples were collected are extracted from the CTD profiles and presented with the bacteriological data.

Bacteriological Reporting and Quality Assurance

Estimated values for bacteriological analyses are denoted by greater than (>), less than (<), or estimated (e) qualifiers and result from plates with colony counts above or below the permissible counting limits established in Bordner et al. (1978)¹. This document defines membrane filtration limits of 20–80 colonies per plate for total coliforms and 20–60 colonies per plate for fecal coliforms and *Enterococcus*. No Data (ND) is reported if plate counts from all dilutions have a total colony count of >200 per plate.

Results of the bacteriological analysis of seawater samples collected from each of the shore, kelp bed, and offshore stations located within State waters are assessed relative to the geometric mean and single sample maximum water-contact standards specified in the California Ocean Plan. The seven standards are defined as follows:

30-day Geometric Mean: The following standards are based on the geometric mean of the five most recent samples from each site.

- (1) Total coliform density shall not exceed 1000 CFU/100 mL;
- (2) Fecal coliform density shall not exceed 200 CFU/100 mL;
- (3) *Enterococcus* density shall not exceed 35 CFU/100 mL

Single Sample Maximums:

¹ Bordner, R., J. Winter, and P. Scarpino (eds.). (1978). Microbiological Methods for Monitoring the Environment: Water and Wastes, EPA Research and Development, EPA-600/8-78-017. 337 p.

- (1) Total coliform density shall not exceed 10,000 CFU/100 mL;
- (2) Fecal coliform density shall not exceed 400 CFU/100 mL;
- (3) *Enterococcus* density shall not exceed 104 CFU/100 mL;
- (4) Total coliform density shall not exceed 1,000 CFU/100 mL when the fecal coliform/total coliform ratio exceeds 0.1.

Quality controls of bacteriological data include laboratory and field duplicate analyses. Laboratory duplicates are performed on approximately 10% of the water quality samples, while field duplicates are performed six times a month (see Appendix A). Laboratory duplicates represent two aliquots of the original sample that are split in the laboratory and analyzed by the same analyst using identical procedures within the same analytical run. The results of these analyses provide a measure of intra-analyst precision. In contrast, field duplicates represent two separate samples collected at the same time from the same site, which are handled under identical circumstances and treated the same throughout field and lab procedures. The results of these analyses provide a measure of precision associated with sample collection, preservation, storage, and lab procedures. The sign test (see Gilbert, 1987²) is used to statistically compare both the results from the laboratory duplicates, as well as the results from the field duplicates. These data will be further analyzed in the City's 2021 Quality Assurance Report, which will be completed in March 2022.

SUMMARY OF RESULTS

As of October 2020, new 2019 Ocean Plan Water Quality Objectives are included for a six-week rolling geometric mean of *Enterococcus* density, which shall not exceed 30 cfu/100 ml, and a Statistical Threshold Value (STV) for *Enterococcus*, which shall not exceed 110 cfu/100 ml for more than 10% of samples per month (see Appendix B).

Additionally, the final project report for the 2021 Point Loma Wastewater Treatment Plant (PLWTP) Chlorine Reduction Study is included as Appendix C. This study occurred in response to a nationwide chlorine shortage that caused an unplanned, necessary reduction in chlorine disinfection of PLWTP effluent from June 15, 2021 through August 18, 2021. To assess any potential effects on receiving waters resulting from decreased disinfection, the City's Environmental Monitoring and Technical Services Division conducted semi-weekly sampling of the PLWTP Effluent (PLE) and at a select group of offshore monitoring stations closest to the outfall. The results from this additional monitoring are included herein.

Shore Stations

- The eight shore stations (D4, D5, D7, D8-B, D9, D10, D11, D12) were sampled on September 1, 8, 15, 22, and 29.
- During September, each of the shore stations was in compliance with the various 2015 California Ocean Plan (Ocean Plan) water contact standards.
- Nothing of sewage origin was observed at any of the shore stations.
- Over the years, elevated bacteria levels at shore and kelp bed stations have tended to be associated with rainfall events, heavy recreational use, or the presence of seabirds or decaying kelp and surf grass. See the City of San Diego's most recent *Biennial Receiving Waters*

Monitoring and Assessment Report for the Point Loma and South Bay Ocean Outfalls for details (<https://www.sandiego.gov/public-utilities/sustainability/ocean-monitoring/reports>).

Kelp Bed Stations

- The eight kelp bed water quality stations (A1, A6, A7, C4, C5, C6, C7, C8) were sampled on September 7, 13, 22, and 28.
- During September, each of the kelp stations was in compliance with the various 2015 California Ocean Plan (Ocean Plan) water contact standards.
- Water column temperatures ranged from 12.86 to 19.47°C. The difference between surface and bottom waters ranged from 1.84 to 5.97°C.
- Chlorophyll *a* concentrations ranged from 0.53 to 3.62 µg/L.
- Nothing of sewage origin was observed at any of the kelp stations.

Offshore Stations

- Quarterly water quality sampling was not conducted during September at the offshore stations. The next quarterly sampling is scheduled for November 2021.

Kelp Stations

Table 3.1

Summary of compliance with the Ocean Plan's 30-day Geometric Mean standard for total coliform bacteria at the PLOO kelp stations. Data are based on the geometric mean of the five most recent samples from each site over the previous 30 days unless otherwise noted (*). Values >1,000 CFU/100 mL exceed the standard.

28 Sep 2021	IC							

IC = In Compliance

E = Exceedance

ns = not sampled

ND = no data

Table 3.6

Summary of compliance at the PLOO kelp stations with the Ocean Plan's Single Sample Maximum standard for *Enterococcus* bacteria, which states that *Enterococcus* density shall not exceed 104 CFU/100 mL.

Date	A1	A6	A7	C4	C5	C6	C7	C8
07 Sep 2021	IC							
13 Sep 2021	IC							
22 Sep 2021	IC							
28 Sep 2021	IC							

IC = In Compliance

E = Exceedance

ns = not sampled

ND = no data

Table 3.7

Summary of compliance at the PLOO kelp stations with the Ocean Plan's Single Sample Maximum standard for total coliform bacteria and the fecal/total coliform ratio (F:T), which states that total coliform density shall not exceed 1,000 CFU/100 mL when F:T > 0.1.

Date	A1	A6	A7	C4	C5	C6	C7	C8
07 Sep 2021	IC							
13 Sep 2021	IC							
22 Sep 2021	IC

IC = In Compliance

E = Exceedance

ns = not sampled

ND = no data

Table 3.8

Summary of water quality parameters at the PLOO kelp stations for each sample date. Densities of total coliform (Total), fecal coliform (Fecal) and *Enterococcus* (Enter) bacteria are reported as CFU/100 mL; the fecal:total coliform ratio (F:T) is unitless; values for temperature (Temp, °C), transmissivity (XMS, %), dissolved oxygen (DO, mg/L), salinity (Sal, ppt) and pH were extracted from CTD profile data for depths closest to those at which the bacteriological samples were collected. Comments follow the data summary.

Station	Date	Time	Depth	Total	Fecal	Enter	F:T	Temp	XMS	DO	Sal	pH

Point Loma Wastewater
Treatment Plant
Chlorine Reduction
Study 2021

The City of
SAN DIEGO
Public Utilities Department

Environmental Monitoring & Technical Services Division

September 30, 2021

Mr. David W. Gibson, Executive Officer
California Regional Water Quality Control Board
San Diego Region
2375 Northside Drive, Suite 100
San Diego, CA 92108

Attention: POTW Compliance Unit

Dear Mr. Gibson:

Enclosed is the final project report for the 2021 Point Loma Wastewater Treatment Plant (PLWTP) Chlorine Reduction Study. This study occurred in response to a nationwide chlorine shortage that caused an unplanned, necessary reduction in chlorine disinfection of PLWTP effluent from June 15, 2021 through August 18, 2021. To assess any potential effects on receiving waters resulting from decreased disinfection, the City's Environmental Monitoring and Technical Services Division conducted semi-weekly sampling of the PLWTP Effluent (PLE) and at a select group of offshore monitoring stations closest to the outfall. The results from this additional monitoring are included herein.

Sincerely,

Peter S. Vroom, Ph.D.
Deputy Public Utilities Director

PSV:akl

Point Loma Wastewater Treatment Plant

Chlorine Reduction Study 2021

Introduction

In 2021, the US experienced a nationwide chlorine shortage, which severely restricted the use of this essential disinfectant. Low chlorine supplies were mainly tied to a chemical fire that destroyed a chlorine manufacturer's facility in Louisiana (BioLab, Inc.) after hurricane Laura's landfall in August 2020, leaving two other domestic companies, Clearon Corp. and Occidental Petroleum, to fulfill the high demand.

In June 2021, the chlorine shortage began to affect public utility agencies who had to allocate the reduced supply between drinking water and wastewater disinfection. So as not to compromise the safety of drinking water, the City of San Diego's Public Utilities Department made the difficult decision to reduce chlorine disinfection at the Point Loma Wastewater Treatment Plant (PLWTP) to preserve supplies. The reduction in chlorine disinfection began on June 15, 2021 when the disinfection rate was lowered by 33% from 6 ppm to 4 ppm and then lowered a further 25% to 3 ppm the following day, on June 16, 2021. A full chlorination dose rate of 6 ppm was restarted on August 18, 2021.

To assess any potential effects on receiving waters, resulting from the reduction in disinfection at the PLWTP, the City's Environmental Monitoring and Technical Services Division (EMTS) immediately began additional semi-weekly sampling of the PLWTP Effluent (PLE) and a select group of offshore monitoring stations closest to the outfall. However, it is important to note that these sampling stations are not subject to regulatory compliance requirements. Results of this sampling effort are detailed below.

Methods

Point Loma Effluent Sampling

PLE is sampled at the treatment plant via a small hose coming off the effluent flow line. Under normal sampling conditions, this station is sampled on a weekly basis. However, during the period of reduced chlorination at the PLWTP, the station was sampled semi-weekly. A single sample was collected twice per week in a 100 mL IDEXX sterile sample container containing a small amount of sodium thiosulfate, following standard sampling procedures. Sample bottles were filled using aseptic sampling techniques, and samples were put on ice until returned to the lab for analysis. A total of 18 samples were collected between June 18, 2021 and August 16, 2021. Each sample was analyzed for the presence of three types of fecal indicator bacteria used in the assessment of water quality, including fecal coliform, total coliform, and *Enterococcus* (per permit requirements).

Receiving Water Sampling

To assess the effects of chlorine reduction on receiving water quality, three existing water quality stations (F29, F30, and F31), which are closest to the Point Loma Ocean Outfall (PLOO) discharge site, were chosen for additional sampling (see Figure 1). Typically, these stations, along with 33 other offshore PLOO stations, are sampled on a quarterly basis in winter (February), spring (May), summer (August), and fall (November) to monitor water quality conditions and to estimate dispersion of the PLOO wastewater plume.

However, during the period of chlorine reduction, a total of 44 additional seawater samples were collected at each station (F29, F30, and F31) between June 19, 2021 and August 17, 2021. The additional samples were analyzed for the presence of *Enterococcus* bacteria (per permit requirements). One sample was taken at each of four discrete depths (25, 60, 80, and 98 m) over 11 separate sampling days. These samples were collected using a rosette sampler fitted with Niskin bottles surrounding a central Conductivity, Temperature, and Depth (CTD) instrument.

Statistical Analysis

To control the scope of analysis, and to facilitate a robust statistical comparison of the data between the samples collected during the period of chlorine reduction and prior to the reduction, analyses were limited to an equal number of samples before and after the reduction was implemented. Thus, if 11 samples were collected during the period of chlorine reduction, then the preceding 11 samples collected prior to the reduction were used for comparison. As data were not normally distributed, a non-parametric Mann-Whitney *U* test was performed to assess the effect of the chlorine reduction on water quality for both PLE and receiving waters. Data are reported below as Mean \pm Standard Error.

Results

During the period of reduced chlorine disinfection at the PLWTP, levels of fecal coliform and total coliform rose by a statistically significantly amount in the PLE (i.e. p -value ≤ 0.05 ; Table 1). Fecal coliform increased by 42% from approximately $6.9 \pm 1.3 \times 10^6$ to $9.7 \pm 1.8 \times 10^6$ MPN/100mL (Mann-Whitney *U* = 269.5, $p \leq 0.05$), and total coliform increased by 81% from approximately 16.8 ± 2.5 MM to 30.4 ± 5.1 MM MPN/100 mL (Mann-Whitney *U* = 256.5, $p \leq 0.05$; Table 1). In contrast, levels of *Enterococcus* bacteria appeared to go down during the period of reduced chlorination, from approximately $115 \pm 32 \times 10^3$ to $85 \pm 9 \times 10^3$ CFU/100 mL, however, no statistically significant difference was observed (Mann-Whitney *U* = 328, $p = 0.887$; Table 1).

At offshore stations surrounding the PLOO (F29, F30, and F31), levels of *Enterococcus* bacteria appeared to increase at all depths in line with the reduction in chlorination, with the exception of the 25-m depth samples, which showed little to no variance and collectively ranged from just 2.0 to 12.0 CFU/100 mL regardless of chlorination level (Table 2). Despite the apparent increase in levels of *Enterococcus* bacteria at the 60-m, 80-m, and 98-m depths, almost no statistically significant difference was observed at these sites as a result of the reduced chlorine disinfection (i.e. p -value > 0.05 ; Table 2). In fact, only the 80-m samples at station F29 showed a statistically significant increase in *Enterococcus* bacteria (Mann-Whitney *U* = 93.5, $p \leq 0.05$) during the period of reduced chlorination, from 52 ± 25 CFU/100 mL to 443 ± 140 CFU/100 mL, which equated to an 845% increase in these bacteria levels (Table 2).

Summary

A reduction in chlorination at the PLWTP resulted in a statistically significant increase in total coliform and fecal coliform bacteria in the PLE, and in levels of *Enterococcus* bacteria observed at a single station depth at the PLOO discharge site (i.e. F29, 80 m). Under normal chlorination (i.e. 6 ppm), it is typical to observe elevated *Enterococcus* levels ≥ 104 CFU/mL in the 80 m depth samples at stations F29, F30, and F31, and also at the 60 m depth samples at station F30 (Table 2). These sample locations coincide with the wastewater plume's dispersion trajectory and rise height and so are more likely to exhibit elevated

bacterial levels. Despite the apparent increase in *Enterococcus* bacteria at these stations as a result of the chlorine disinfection reduction, the wastewater plume remained trapped at depth, ensuring low bacteria levels in surface waters and minimal to zero impact on human health (Table 2).

Further assessment of these data will be conducted as part of the City's 2020-2021 Biennial Report, which is due to be completed by July 1, 2022.

Tables and Figures

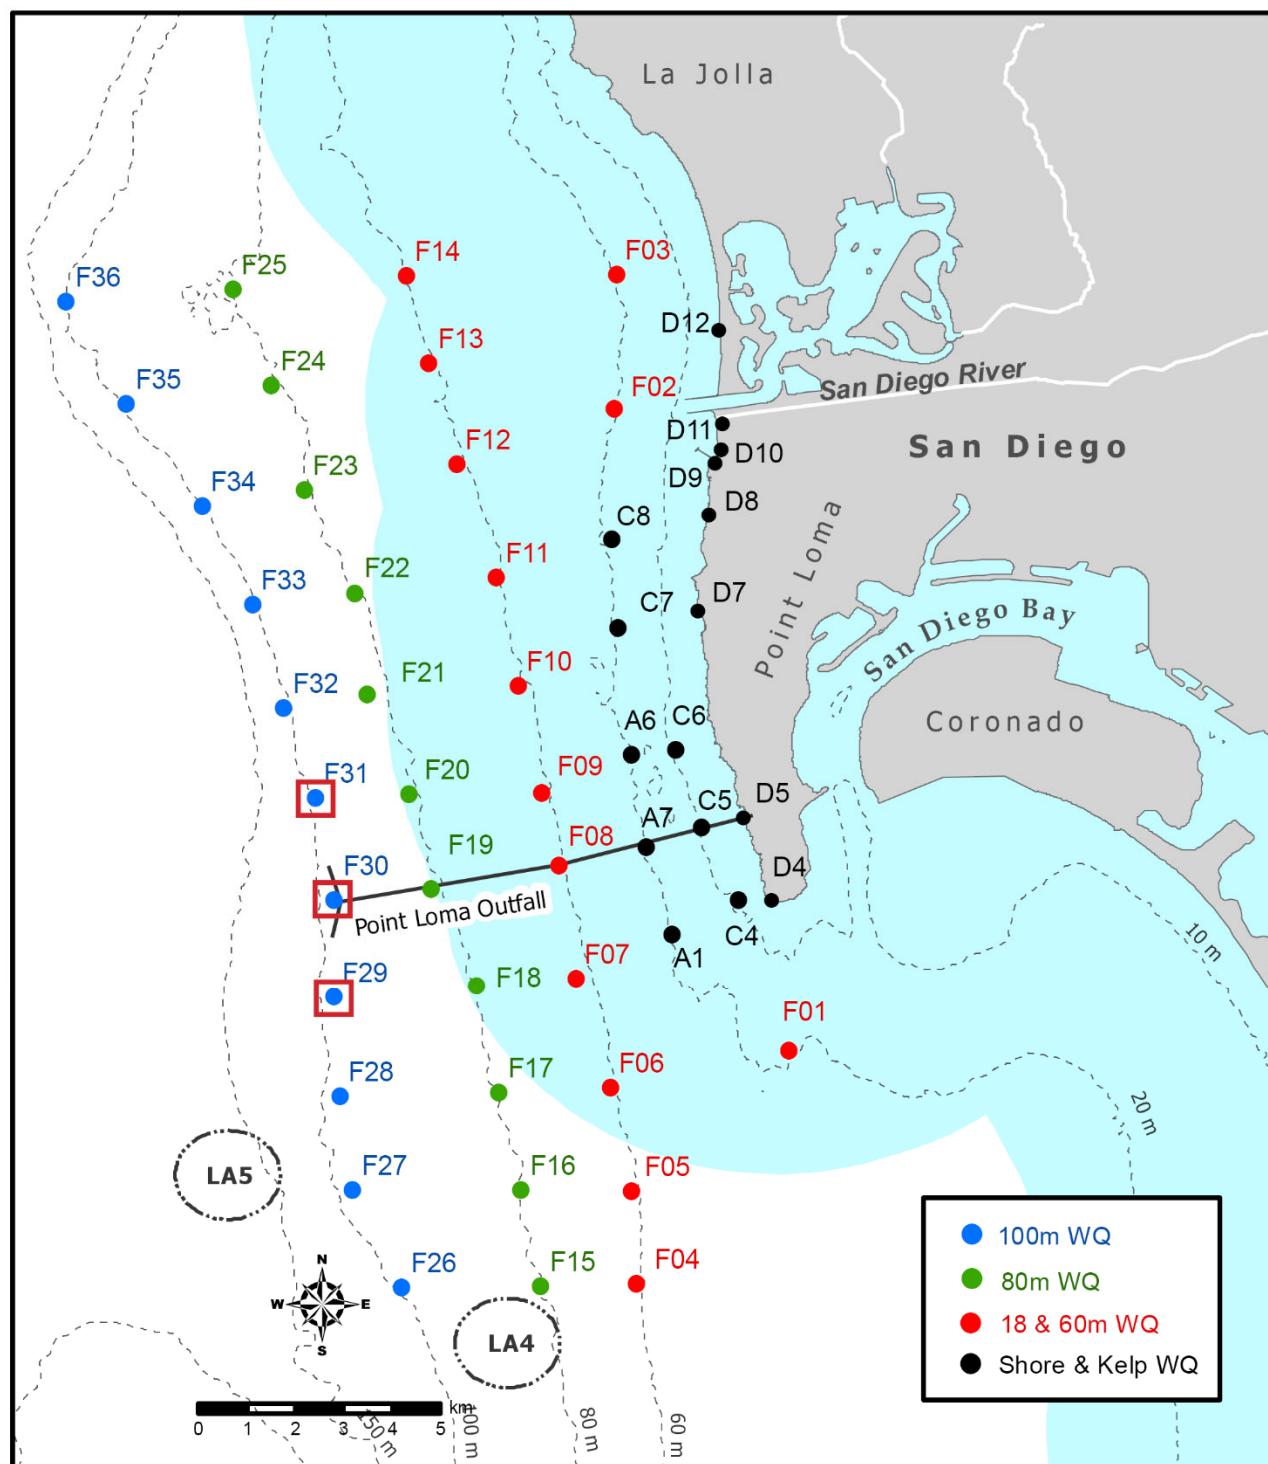

Figure 1

Water quality (WQ) monitoring station locations sampled around the Point Loma Ocean outfall (PLOO) as part of the City of San Diego's Ocean Monitoring Program. Light blue shading represents State jurisdictional waters. Red squares indicate stations sampled for chlorine reduction study (i.e. F29, F30, and F31).

Table 1

Fecal indicator bacteria levels in the Point Loma Effluent before and during a reduction in chlorine disinfection at the Point Loma Wastewater Treatment Plant.

Fecal Indicator Bacteria	Pre-Chlorination Reduction (Feb 16, 2021– June 14, 2021)			Chlorination Reduction (June 18, 2021-Aug 16, 2021)			p-value
	N	Range Low - High	Mean ± SE	N	Range Low - High	Mean ± SE	
Enterococcus (CFU/100 mL)	18	10,000 - 600,000	114,722 ± 32,220	18	39,000 - 150,000	85,389 ± 9,318	0.887
Fecal Coliform (MPN/100 mL)	18	1,700,000 - 24,000,000	6,861,111 ± 1,328,819	18	3,300,000 - 35,000,000	9,727,778 ± 1,812,805	0.043*
Total Coliform (MPN/100 mL)	18	3,300,000 - 35,000,000	16,755,556 ± 2,528,533	18	7,900,000 - 92,000,000	30,383,333 ± 5,056,790	0.015*

*Denotes a statistically significant result.

Table 2

Enterococcus bacteria levels (CFU/100 mL) in receiving waters at stations F29, F30, and F31 before and during a reduction in chlorine disinfection at the Point Loma Wastewater Treatment Plant.

Station F29		Pre-Chlorination Reduction (Nov 17, 2018 - May 11, 2021)			Chlorination Reduction (June 19, 2021-Aug 17, 2021)			p-value [#]
Depth (m)	N	Range Low - High	Mean ± SE	N	Range Low - High	Mean ± SE		
25	11	2.0 - 12.0	2.9 ± 0.9	11	2.0 - -	2.0 ± -		-
60	11	2.0 - 40.0	7.8 ± 3.6	11	2.0 - 580.0	64.4 ± 51.8		0.322
80	11	2.0 - 240.0	52.4 ± 25.2	11	2.0 - 1200.0	442.7 ± 140.2		0.029*
98	11	2.0 - 220.0	26.5 ± 19.5	11	2.0 - 560.0	76.7 ± 49.7		0.566

Station F30		Pre-Chlorination Reduction (Nov 17, 2018 - May 11, 2021)			Chlorination Reduction (June 19, 2021-Aug 17, 2021)			p-value [#]
Depth (m)	N	Range Low - High	Mean ± SE	N	Range Low - High	Mean ± SE		
25	11	2.0 - -	2.0 ± -	11	2.0 - -	2.0 ± -		-
60	11	2.0 - 700.0	182.9 ± 79.4	11	2.0 - 2600.0	433.5 ± 239.2		0.843
80	11	2.0 - 900.0	224.2 ± 81.3	11	18.0 - 1200.0	440.7 ± 122.9		0.189
98	11	2.0 - 300.0	55.1 ± 25.7	11	2.0 - 580.0	98.5 ± 52.9		1.000

Station F31		Pre-Chlorination Reduction (Nov 17, 2018 - May 11, 2021)			Chlorination Reduction (June 19, 2021-Aug 17, 2021)			p-value [#]
Depth (m)	N	Range Low - High	Mean ± SE	N	Range Low - High	Mean ± SE		
25	11	2.0 - -	2.0 ± -	11	2.0 - 6.0	2.5 ± 0.4		-
60	11	2.0 - 320.0	40.7 ± 29.0	11	2.0 - 540.0	69.5 ± 47.8		0.704
80	11	2.0 - 400.0	96.2 ± 38.8	11	2.0 - 3200.0	402.5 ± 283.6		0.620
98	11	2.0 - 40.0	12.7 ± 4.0	11	2.0 - 280.0	46.9 ± 25.1		0.639

*Denotes a statistically significant result.

[#]Statistical comparisons could not be performed on data from the 25 m depth contour due to lack of variance (i.e. all data points equal the same value).
