1.0 Introduction

This monitoring report presents the results of activities conducted within the Heritage Brodiaea Preserve (HBP) during the period of January 1 to December 31, 2024. Activities discussed in this report include site maintenance activities, thread-leaved brodiaea (*Brodiaea filifolia*) 2024 population (vegetative) counts and flowering data, native grassland mitigation progress, and other activities.

The HBP is an approximately 14-acre biological open space area that was dedicated as part of the Heritage Bluffs II development project. The HBP is located in the northern part of San Diego (Figure 1) and it occurs to the south of Carmel Valley Road and to the east of the Black Mountain Open Space Preserve (Figure 2). The City of San Diego has now included the HBP area into its Multiple Species Conservation Program Subarea Plan's Multi-Habitat Planning Area.

The goal of the HBP is to facilitate the conservation, preservation, and enhancement of biological resources as part of mitigation for impacts associated with development of the Heritage Bluffs II and East Clusters development project sites. The HBP has preserved a regionally significant population of thread-leaved brodiaea in a Conservation Easement dedicated for that purpose.

2.0 HBP Translocation History

The translocation of salvaged thread-leaved brodiaea occurred as part of the East Clusters Unit 3 and Heritage Bluffs II development projects and the locations of these translocations are shown on Figure 3. These translocation efforts established the baseline numbers of thread-leaved brodiaea plants for the mitigation monitoring effort. The 2024 monitoring year represents the seventh year after translocation for the Heritage Bluffs II thread-leaved brodiaea and the eighth year after translocation for the East Clusters Unit 3 effort.

3.0 HBP 2024 Maintenance Activities

Maintenance activities conducted within the HBP area during 2024 focused on the control of perennial weeds. General control of perennial weeds occurred throughout the year due to the above average annual rainfall. During the fall months, weeding was conducted around thread-leaved brodiaea locations to remove excess thatch of non-native grasses.

4.0 HBP 2024 Thread-leaved Brodiaea Vegetative Counts

A census of the number of thread-leaved brodiaea expressing vegetative growth for the translocation areas in the HBP was conducted during the months of January through March of 2024. The census involved the mapping of expressed natural thread-leaved brodiaea plants not previously located, and all translocated thread-leaved brodiaea plant locations (i.e., corm and cut/block) now within the HBP. A census of the natural thread-leaved brodiaea plants expressing vegetatively in the HBP was not conducted this year.

Each thread-leaved brodiaea translocation location was visited and a direct count of the vegetative individuals expressed at the location was done. The last vegetative count data for the HBP natural population conducted in 2021 is given in Table 1. The 2024 vegetative counts for all translocated/transplanted thread-leaved brodiaea are presented in Table 2 (Heritage Bluffs II translocated) and Table 3 (East Clusters Unit 3 translocated and transplanted), along with vegetated count data from previous years and the baseline reference counts.

Table 1
HBP Thread-leaved Brodiaea Vegetative Counts for Natural Population

	Vegetative Count*				
	2017	2018	2019	2010	2021
TOTAL	**10,211**	**15,263**	**13,811**	**13,848**	**13,161**

***Based on count of individuals that expressed vegetatively.

Table 2
Heritage Bluffs II Thread-leaved Brodiaea Translocation Summary: 2017 through 2024

Translocation Method	Initial Translocation Estimate	Vegetative Count*							
		2017	2018 Year 1	2019 Year 2	2020 Year 3	2021 Year 4	2022 Year 5	2023 Year 6	2024 Year 7
Corm Translocation	2,690	2,556	2,727	3,192	3,840	4,859	4,934	4,269	4,539
Corm Translocation†	1,166	1,161	1.262	1,389	1,413	1,774	1,435	1,155	1,287
Cut-Block Salvage‡	1,850	2,414	2,477	3,816	3,789	3,496	3,574	2,557	2,703
TOTAL	**5,706****	**6,131**	**6,556**	**8,397**	**9,013**	**10,129**	**9,943**	**7,981**	**8,529**

*Based on count of individuals that expressed vegetatively.
†Salvaged from East Clusters.
‡Salvaged and planted March 2017.
**Total planted individuals to be used as baseline for subsequent site assessments.

Table 3 East Clusters Unit 3 Thread-leaved Brodiaea Translocation Summary: 2016 through 2024									
Translocation Method	Vegetative Count*								
	2016	2017	2018	2019	2020	2021	2022	2023	2024
Corm Translocation	3,175	3,281	3,569	5,311	5,306	7,358	8,471	7750	8,378
TOTAL	**3,175**	**3,281**	**3,569**	**5,311**	**5,306**	**7,358**	**8,471**	**7,750**	**8,378**
*Based on count of individuals that expressed vegetatively.									

Herbivory was relatively low to the natural thread-leaved brodiaea locations during 2024. The average amount of precipitation coupled with the frequency of events were good for vegetation growth in the HBP. The primary cause of herbivory was from animals grazing on the vegetative shoots during the late winter months.

Precipitation amounts for this portion of San Diego County were normal during the 2023-2024 rainfall season. The above-average amount of precipitation coupled with good frequency of events were both good for vegetation growth in the HBP. As such, the number of the thread-leaved brodiaea that expressed vegetatively within the translocation areas increased when compared to the previous year vegetative counts. Representative photographs of vegetative growth observed during the 2024 counts are provided (Photographs 1 through 7). All photographs referenced in this report are located in Attachment 1.

5.0 HBP 2024 Thread-leaved Brodiaea Flowering Individuals Count

A count of the number of thread-leaved brodiaea individuals that produced a flower stalk during the spring of 2024 was conducted within the HBP. The flower stalk count included all the translocated locations. The data on flowering individuals are given in Table 4. Representative photographs of flowering individuals of thread-leaved brodiaea are shown in Photographs 8 through 14.

Table 4 HBP Thread-leaved Brodiaea Flowering Individuals (2024)		
Brodiaea Type	Flowering Individuals	Percent Vegetative Individuals Flowering
Heritage Bluffs II Corm Translocation	304	5.4
Heritage Bluffs II Corm Translocation	66	5.1
Heritage Bluffs II Cut-Block Translocation	31	1.3
East Clusters Unit 3 Corm Translocation	512	6.1

The percentage of those thread-leaved brodiaea that expressed vegetatively and then flowered ranged between 1.3 percent and 6.1 percent during the spring of 2024. This flowering data is significantly lower than in 2023, but consistent with other years where rainfall was at or below

average. Although vegetative expression was higher than the previous year, the corms that expressed vegetatively in 2024 died back sooner, shortening the flowering period which likely limited the production of flower stalks.

6.0 Plant and Wildlife Observations

Vegetation cover estimates were conducted visually. Native plant cover in the HBP primarily consists of native bunchgrasses along with scattered individuals of native perennial plants, for example, gumplant (*Grindelia camporum*), lemonadeberry (*Rhus integrifolia*), redberry (*Rhamnus crocea*), coastal goldenbush (*Isocoma* menzessii), long-stemmed golden yarrow (*Eripohyllum confertiflorum*), and California buckwheat (*Eriogonum fasciculatum*). The estimated vegetative plant cover for the HBP is approximately 60 percent.

A list of plant species observed within the HBP, compiled during monitoring visits, is provided as Attachment 2. A total of 65 plants species were documented. Examples of native species observed in the preserve areas include blue-eyed grass (*Sisyrinchium bellum*) (Photograph 15), California poppy (*Eschscholzia californica*) (Photograph 16), deerweed (*Acmispon glaber*) (Photograph 17), small-flowered morning glory (*Convolvulus simulans*) (Photographs 18 and 19), white nightshade (*Solanum americanum*) (Photograph 20), cryptantha (*Cryptantha* sp.) (Photograph 21), and common goldfields (*Lasthenia gracilis*) (Photograph 22).

A list of general wildlife species observed within the HBP was compiled during monitoring visits and is provided as Attachment 3. Observed wildlife included 7 species of insect, 1 snail species, 4 reptile species, 25 bird species, and 4 mammal species. Notable wildlife species observed on the site this past year were greater roadrunner (*Geococcyx californianus*), coyote (*Canis latrans*), California quail (*Callipepla californica*), southern Pacific rattlesnake (*Crotalus oreganus helleri)* (Photograph 23), and San Diego gophersnake (*Pituophis catenifer annectens*). An owl box was installed in the larger western preserve area in the fall of 2021 to attract barn owls; however, no owls have occupied the box to date.

7.0 Native Grassland Mitigation (Year 4)

The Heritage Bluffs II development project conditions of approval required the implementation of a native grassland mitigation element. A mitigation plan was approved that outlined the mitigation requirement that included the establishment of a minimum 0.15 acre of native grassland and the enhancement of a 0.30-acre buffer within a 0.45-acre restoration area. The restoration area rehabilitated two old dirt roads that previously existed in the HBP (see Figure 3).

Implementation of the native grassland mitigation within the HBP began with the planting of the native bunch grasses during the first week of December 2020. Weed control was the primary maintenance activity conducted in the native grassland mitigation area during the current year.

The success criteria for the native grassland mitigation include the assessment of species richness/recruitment, native vegetation cover, non-native vegetation cover, and target invasive species. The assessment of these criteria for Year 4 of the five-year monitoring period is as follows:

- Species Richness and Recruitment: Evaluation of the number of native species observed in the native grassland mitigation area found five native plant species: purple needlegrass (*Stipa pulchra*), foothill needlegrass (*Stipa lepida*), California encelia (*Encelia* californica), willow herb (*Epilobium brachycarpum*), and long-stemmed golden-yarrow (*Eriophyllum confertiflorum*) (Photograph 24). The presence of five native species meets the Year 4 success criteria milestone which required five native species to be present. Recruitment of needlegrasses (Photograph 25), long-stemmed golden yarrow, and willow herb were observed this year.

- Native Vegetation Cover: Native vegetation cover was estimated to be 60 percent and consisted primarily of the two native grass species planted (Photographs 26 and 27). The Year 4 success criteria milestone is 45 percent. The vegetative cover of the native grasses this year increased substantially over the last year due to favorable weather conditions and implementation of weed control measures.

- Non-native Vegetation Cover: Cover of non-native vegetation was less than 1 percent due to the regular control of non-native species. The Year 4 success goal for this criterion was a maximum of 20 percent cover of non-native species.

- Target Invasive Species: There were no significant numbers of target invasive species (e.g., artichoke thistle [*Cynara cardunculus*], fennel [*Foeniculum vulgare*], Australian saltbush [*Atriplex semibaccata*], black mustard [*Brassica nigra*], bristly ox-tongue [*Helminthotheca echioides*], Russian thistle [*Salsola tragus*]) within the native grassland mitigation area due to regular control of these species during maintenance visits. The success goal for this criterion for Year 4 was no target invasive species present.

The native grassland mitigation area is progressing well. Regular control of non-native plant species and continued recruitment of native grasses and other native plants improves the overall habitat quality.

8.0 Supplemental Planting

Supplemental planting within the HBP occurred during the fall of 2023. One-gallon container stock of purple needlegrass and foothill needlegrass were planted in portions of the larger western preserve area. The native grass container stock had a relatively high survivorship and contributed to the native plant cover observed in 2024 (Photograph 28).

Supplemental planting of additional one-gallon container stock of native grasses was scheduled to occur in December of 2024. However, the container stock was not installed due to the lack of rainfall needed to charge the soil moisture to enhance survivorship. The planting of the native grass container stock will be implemented in February or March of 2025 depending on the timing of seasonal rainfall.

9.0 Annual Dethatch

An annual dethatch of the translocation/transplant plots and the natural thread-leaved brodiaea locations was conducted in the fall of 2024. The dethatch is necessary to remove the dead vegetative biomass from the non-native grasses that grow within and adjacent to these areas so that the emerging thread-leaved brodiaea the following winter would not be inhibited. Without removal of the dense thatch the thread-leaved brodiaea may not be able to grow through the dead biomass and thus be shaded resulting in high mortality rates.

The non-native grasses can dominate the cover in and around the thread-leaved brodiaea locations (Photographs 29-32). As this cover of non-native grass dries and falls to the ground it creates a thatch of dead biomass that can be several inches thick. Liner trimmers are used to cut this dead grass and raking removes the biomass so the thread-leaved brodiaea locations are prepared for the next winter's reemergence (Photographs 33–38).

10.0 Management Activities for 2025

Management activities to be conducted during 2025 will focus on the continued control of perennial non-native plant species (e.g., artichoke thistle re-sprouts, fennel re-sprouts, Russian thistle, prickly lettuce [*Lactuca serriola*], flaxed-leaved horseweed [*Erigeron bonariensis*] and other weed species). Although significant progress was made in the control of perennial non-native plant species in 2024, control efforts will continue in an effort to keep vegetative cover of these non-native species at low levels. An annual dethatching of the thread-leaved brodiaea translocation/transplant plots and natural locations is anticipated to occur in the fall of 2025 to reduce dead biomass.

The maintenance of the native grassland mitigation area will concentrate on the control of invasive plant species. If weed control progresses well, other native plants may be added to the native grassland mitigation area this year to increase species richness. In addition, planting of native bunch grasses, as mentioned above, and the addition of some native shrub species may occur in other areas of the HBP in the fall of 2025 to augment other areas planted this year and to begin to fill in additional bare areas.
