

Storm Water Best Management Practice Inspection and Maintenance Workshop

April 6, 2011

Project Team

City Staff:

- Sumer Hasenin
- Jim Nabong
- Jim Hook

North Carolina State University

- Bill Hunt
- Bill Lord

Tetra Tech Staff:

- Scott Struck
- Jason Wright
- Chad Helmle

**Best Management Practice
Inspection and Maintenance Workshop**
Hosted by the City of San Diego
Maintaining LID in San Diego

April 6, 2011
9 am - 5 pm
Ballroom Park Club Ballrooms
2150 Pan American Road, West
San Diego, CA 92101

Instructions
Tetra Tech, Inc. (TT),
NC State University
Bill Hunt
Bill Lord
Scott Struck, PhD
Jason Wright, PE
Tetra Tech

A growing number of Low Impact Development (LID) are being implemented in private development and public improvement projects to comply with current storm water permit requirements. To date, a nationally recognized (NCE) report, and the team will conduct a full day workshop that will include:

- ✓ Understand stormwater management practices implemented in San Diego as presented in the Low Impact Development Design Manual and Low Flow Section
- ✓ Understand inspection and maintenance requirements for each stormwater practice including observation, permit, personnel, equipment, and maintenance
- ✓ Understand design and implementation strategies for increasing additional maintenance requirements

Registration
Workshop is free.
Registration is required for attendance. Please RSVP to Mary Russell-Jones at maryrusselljones@cityofsan-diego.gov by March 24th. Light refreshments will be provided.

BMP I & M Workshop Agenda

WELCOME (8:30am)

- Regulatory Overview & LID Concepts
- Fundamentals of BMP Maintenance & Examples from NC
- Bioretention/Bio Swales
- Infiltration Trenches
- Permeable Pavement

LUNCH (12:00pm)

- Planter Boxes
- Vegetated Filter Strips & Vegetated Buffers
- Sand Filters
- Vegetated Swales
- Simple "Green" BMPs: Cisterns/ Irrigation/ Green Roofs
- Wrap up
- Open Q&A

ADJOURN (5:00pm)

Regulatory Background

• Regulations Summary

- Clean Water Act
- EPA delegates authority to State and Regional Water Boards

• Regulatory Drivers

- The 2007 Municipal Stormwater Permit
 - ❖ LID
 - ❖ HMP
- Total Maximum Daily Loads
- Areas of Biological Significance

MS4 Permit Language

Permit Excerpt

(Order No. R9-2007-0001, Sec. D.1.d.(4))

Low Impact Development (LID) BMP Requirements

Each Copermittee shall require each Priority Development Project to implement LID BMPs which will collectively minimize directly connected impervious areas and promote infiltration at Priority Development Projects

MS4 Permit Language

Permit Excerpt

(Order No. R9-2007-0001, Sec. D.1.d.(6)(a and b))

Treatment Control BMP Requirements

Each Copermittee shall require each *Priority Development Project* (PDP) to implement treatment control BMPs which meet the following treatment control BMP requirements:

- mitigate (infiltrate, filter, or treat) the required volume or flow of runoff from developed project
- treatment control BMPs located to infiltrate, filter, or treat the runoff volume or flow prior to discharge

MS4 Permit Language

Permit Excerpt

(Order No. R9-2007-0001, Sec. D.1.g)

Hydromodification

Each Copermittee shall collaborate with the other copermittees to develop HMP to manage increases in runoff discharge rates and durations from *all* Priority Development Projects, where such increased rates and durations are likely to cause increased erosion of beds and banks, sediment pollutant generation, or other impacts to beneficial uses and stream habitat...

MS4 Permit Language

Permit Excerpt *Sec. D.1.e.(1-4)*

Treatment Control BMP Maintenance Tracking

(2) Each Copermittee shall develop and implement a program to verify that approved treatment control BMPs are operating effectively and have been adequately maintained. At a minimum, the program shall include...

Infiltrate, Filter, or Treat...?

What is LID?

- Low Impact Development is a comprehensive land planning and engineering design approach with a goal of maintaining and enhancing the pre-development hydrologic regime of urban and developing watersheds.

Low Impact Development Center

- LID focuses on minimizing impervious surfaces and promoting infiltration and evaporation of runoff before it can leave the location of origination. Using small, economical landscape features, LID techniques work as a system to filter, slow, evaporate, and infiltrate surface runoff at the source.

San Diego County LID Manual

Low Impact Development Concepts

Under Natural Conditions Runoff is Limited....

....But increases After Development

Low Impact Development Concepts

How do we make this... function more like this?

Low Impact Development Concepts

- **Preserve ecosystem functions in the built environment**
- **Use nature to mimic the natural water balance**
- **Use hydrology as fundamental design guide**
- **Deploy multiple systems beginning at the source**
- **Preserve runoff volume, frequency, rate and timing**

It's not just what we do but how we do it!

- Hydrologically functional land design
- Engineer the site to mimic original hydrologic regime (using MEP and BPJ)
- Distribute and increase assimilative capacity
- Build redundancy
- Build multifunctional landscapes, buildings, and support infrastructure (roadways, etc.)

Future Regulatory "Trends"

Inclusion of water quality goals or limits (e.g. TMDLs) in permits

- Numeric WQBELs in storm water permits
 - Clarify permit requirements and
 - Improve accountability, and
 - Improve enforceability.
- Where MS4 discharges have the potential to cause or contribute to a water quality standard excursion, the NPDES permitting authority should include numeric effluent limitations as necessary to meet WQSS and to create objective and accountable means for controlling stormwater discharges.

"Better information on the effectiveness of stormwater controls to reduce pollutant loadings and address water quality impairments is now available."

Water Quality and NPDES Permit Requirements Based on Clean Water Act (CWA)

FOR: James A. Martin, Director
Office of Watershed Management

FROM: Daniel Kishner, Director
Office of Watershed Management

TO: Water Management Division Director

Page(s) 1 - 10

This memorandum updates aspects of EPA's November 13, 2002 memorandum from Robert H. Wyland, III, Director of the Office of Watersheds, Oceans and Watersheds, and James A. Martin, Director of the Office of Watershed Management, on the subject of "Establishing Total Maximum Daily Load (TMDL) Watershed Assessments (WLA) for Storm Water Discharges and NPDES Permit Requirements Based on These WLA" (hereinafter "2002 memorandum").

Background

Section 402 of the 2002 memorandum "affirmed" the interpretation of an "impaired" water quality standard (WQS) as a "significant" impairment of water quality, and other related standards. Since 2002, EPA and SDWA have obtained significant experience in developing TMDLs and WLA that address water quality issues. The technical capacity to monitor water quality and to measure water quality has improved. In many cases, monitoring of the impacts of stormwater on water quality has become more sophisticated and widespread. Some information on the effectiveness of stormwater controls to reduce pollutant loading and address water quality impairments is now available. In many parts of the country, permitting agencies have issued a wide range of permits for Phase I municipal separate storm sewer systems (MS4s), Phase II MS4s, and stormwater discharges associated with industrial activities, including stormwater from construction activities. Recognizing these developments, stormwater discharges remain a significant cause of water quality

"Storm water discharges remain a significant cause of water quality."

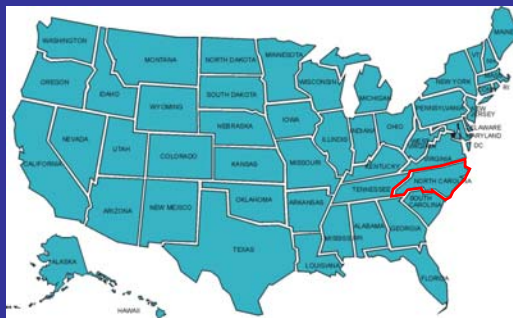

Why We Care About & Common Elements of BMP Maintenance

About North Carolina

- 10th Most Populous State in USA
 - 9.5M
 - SD Co (3M+)
- 5th Fastest Growing Population (2005)

Tourism is BIG BUSINESS for San Diego

By Joanne DiBona, Communications Director, jdibona@sdcvb.org

National Tourism Week, celebrated annually across the country this week, can be considered the "Fourth of July" of the visitor industry.

This is the time of year when the visitor industry gets together to remind the nation of the fact that travel and tourism is more than just a "glamour industry." It is business--big business. In fact, it is the backbone of the economy for many communities across the nation, San Diego being no exception.

Just how big is this catering, recreation and tourism industry? It is the nation's third largest industry, generating \$5.3B in revenue annually. It is also the world's largest industry and generator of jobs. It is America's largest employers.

In fact, one out of every eight people in the U.S. civilian labor force is directly or indirectly employed in travel and tourism.

New cleanup rules for Jordan Lake move forward

BY JIM WISE - STAFF WRITER

Published: Wed, May 06, 2009 02:00AM Modified: Tue, May 05, 2009 11:56PM

RALEIGH -- With even its sponsor admitting the bill's imperfections, the House Environment and Natural Resources Committee voted Tuesday to send revised rules for cleaning up Jordan Lake a step closer to approval.

"This is one of those things you just got to hold your nose and move it on down the road a little bit and hope it'll get better," said Rep. Pryor Gibson of Anson and Union counties. Gibson sponsored the bill along with Reps. Lucy Allen of Halifax, Nash and Franklin counties and Alice Bordsen of Alamance.

The bill, "Restore Water Quality in Jordan Reservoir," contains revisions to proposed environmental-protection rules. The revisions are meant to ease requirements for local governments while bringing the lake into compliance with state and federal water-quality standards.

JORDAN LAKE FORUM

The Durham People's Alliance will hold a forum on proposed Jordan Lake management regulations at 6:30 p.m. May 12 in the Herald-Sun Building Community Room, 2828 Pickett Road in Durham.

The forum will address the cost, effectiveness and fairness of the regulations and whether they have been based on the best available data.

Speakers include John Cox of Durham's stormwater

The City of Durham, which would feel the greatest financial effect from the proposed rules, supports the Gibson-Allen-Bordsen version, but environmental groups support the original regulations.

Under the revisions, local governments would not have to take steps to reduce stormwater pollution from existing development until at least 2016.

"That's too long to wait," said Elizabeth Ouzts,

Stormwater Unit :: Neuse River Nutrient Sensitive Waters Management Strategy

NEW! Updated BMP Efficiencies (Effective 9/8/2004)

Nitrogen efficiencies are for the Neuse and Tar-Pamlico river basins, and the phosphorus efficiencies are only for the Tar-Pamlico river basin.

| Best Management Practices for Nutrient Control | Nitrogen | Phosphorus |
|--|----------|------------|
| Wet Pond | 25 | 40 |
| Stormwater Wetland | 40 | 35 |
| Sand Filter | 35 | 45 |
| Bioretention | 35 | 45 |
| Grass Swale | 20 | 20 |
| Vegetated Filter Strip with Level Spreader | 20 | 35 |
| 50-ft Restored Riparian Buffer with Level Spreader | 30 | 30 |
| Dry Detention | 10 | 10 |

Stormwater management is just one component of the overall Neuse NSW Strategy, which calls for each major source to reduce its nitrogen pollution by 30%. The Neuse NSW stormwater management program (codified in 15A NCAC 2B .0235) applies to the **15 largest local governments** in the Neuse River Basin. These local governments must implement nitrogen reduction programs that include:

- Review and approval of stormwater management plans for new development
- Public education
- Identification and elimination of illegal discharges

Why is Stormwater BMP Inspection and Maintenance Needed?

Communities across the State of North Carolina must manage rainfall that runs off roads, streets and parking lots. This runoff is called stormwater. To manage stormwater, many treatment devices, called BMPs, have been built. These devices include: wet retention ponds, bioretention areas, stormwater wetlands, permeable pavement, and level spreaders. *BMPs must have annual, and sometimes more frequent, maintenance to perform as intended.* Maintenance includes hydrologic and water quality function, aesthetic and human health concerns. Some communities are considering hiring contractors to do this work, but it is a specialized area, making education and training important before you begin. As a result of this training you will:

- Understand stormwater, how it affects water quality, and regulations associated with it
- Understand stormwater management devices used in North Carolina and how they function
- Understand inspection and maintenance requirements of each stormwater practice

About the Training

This workshop offers 7 PDHs (professional development hours) for professional engineers and surveyors, as authorized by the NC Board of Examiners for Engineers and Surveyors. Other professionals may appeal to their respective boards to obtain professional education credits. All participants who pass an examination at the end of the course will be certified by NC State Cooperative Extension. Certificates of Completion will be U.S. mailed to all attendees upon the [posting of Exam Results](#).

NCSU-BAE is also a registered provider of continuing education for AICP and ASLA.

| 013 | Brian Burchett | Cary, NC | 5/15/06 | 12/31/09 |
| 014 | Melanie Clerkley | Cary, NC | 5/15/06 | 12/31/09 |
| 015 | David Dunn | Cary, NC | 5/15/06 | 12/31/09 |
| 016 | Cecil J. Dykes | Cary, NC | 5/15/06 | 12/31/09 |

How Popular is the Certification?

- As of April 1, 2011 – more than 1500 people had been certified
- Over 30 classes offered, most sell out

Success... Across State Borders

- I&M program has been offered in
- California (LA), Georgia (2X), Illinois, and New Zealand
- And (now) San Diego

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Has it worked?

Cary Stormwater BMPs (2007)

- Approximately 425 BMPs in Cary
- According to one of Cary's inspectors: Timothy Grady, RLA:
- 95% of BMPs **failed** initial inspection as they require repairs
- Most repairs are maintenance related: erosion, trash removal, tree removal

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Has it Worked? Cary BMPs... (now)

- ~ 95% pass, as owners better appreciate value of maintenance after investing in repairs...

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Cities and Counties requiring BMP I&M Training

- Greensboro
- Wilson
- Cary
- Durham
- Apex
- Jacksonville
- Charlotte/Mecklenburg
- Forsyth County
- Johnston County

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Our (Initial) Target Audience...

Landscape maintenance 'happens'
and many BMPs are landscape
features

The man with the mower...

- 'Walks' the property every time he mows
- Should be trained to recognize early signs of problems such as:
- Erosion, clogged outlets, security breaches, etc

And Now... the Common BMP Inspection and Maintenance Elements

BMPs are specialized landscape features designed to control stormwater quantity and quality

- Regular inspections are needed
- Inspect during rainfall events
- Use a maintenance checklist
- Focus on preventive maintenance to avoid costly corrective maintenance and repairs

BMP Maintenance Falls Into 3 Main Categories

- Function
 - Hydrologic (Water)
 - Water Quality
- Aesthetics
- Safety

BMPs need

- Regular inspection of components

BMPs need

- Specialized mowing – not scalping

BMPs need

- Specialized pruning

BMPs need

- Plant management

BMPs need

- Water level management

BMPs need

- Protection from sediment

BMPs need

- Regular trash cleaning

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

BMPs can be damaged by...

- Fertilizer
- Sediment from traffic or outparcels
- Poor grass or mulch maintenance
- Roundup and other herbicides
- Excessive or too low mowing
- Compaction

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

BMPs can be damaged by...

- Fertilizer

BMPs can be damaged by...

- Sediment from traffic or outparcels

BMPs can be damaged by...

- Excessive Sediment from upstream

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

BMPs can be damaged by...

- Poor grass or mulch maintenance

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

BMPs can be damaged by...

- Poor vegetation management
- (Roundup)

BMPs can be damaged by...

- Excessive mowing or mowing too low

Finally, never underestimate... The Role of Good Housekeeping

- Prevention of problems is always best
- Dirty watersheds = dirty BMPs

Remember...Storm drains lead to streams *and* BMPs

The solution

- Learn how and why stormwater BMPs work
- Develop specialized maintenance program for stormwater BMPs

Bioretention Maintenance

Why Bioretention?

- A water quality and quantity BMP is needed or required
- The site is dry – no shallow water table, no running water
- The watershed is stable – low probability of sediment deposition
- The 'look' of a landscape bed is desired, with shrubs, trees, or grass

| LID practice type | | | | | | | | | | | | | |
|--------------------------------------|---------------------------|---------|----------|---------|---------------------------------|---------|---------------------|---------------|-------------|--------|------------------------|-----------------|---|
| Attribute | Bioretention ^a | | Bioswale | | Permeable pavement ^a | | Infiltration trench | Planter boxes | Sand filter | | Vegetated filter strip | Vegetated swale | Cisterns/rain barrels |
| | (no UD) | (UD) | (no UD) | (UD) | (no UD) | (UD) | | | (no UD) | (UD) | | | |
| Contribute drainage area (acres) | < 5 | | < 2 | | N/A | | < 2 | < 0.35 | < 5 | | < 1 | < 2 | Rooftop |

Notes:
UD: Underdrain
a. If lined, see the Planter box column
b. If lined, see the Sand filter with underdrain column
c. For tank outlet and overflow

Stormwater Management vs. 'Drainage'

- Agriculture and Engineering have emphasized drainage for centuries – get the water off-site ASAP
- Stormwater management is fundamentally different...
- “Best Management Practices (BMPs) are installed to treat, *slow*, and *reduce* stormwater runoff”

Stormwater Management vs. Landscaping

- BMPs are built for control of runoff and flooding
- BMPs are built for water quality improvement
- Landscape and aesthetic value is tertiary
- Think about it: Why hire an engineer to design a landscape bed??????

So...

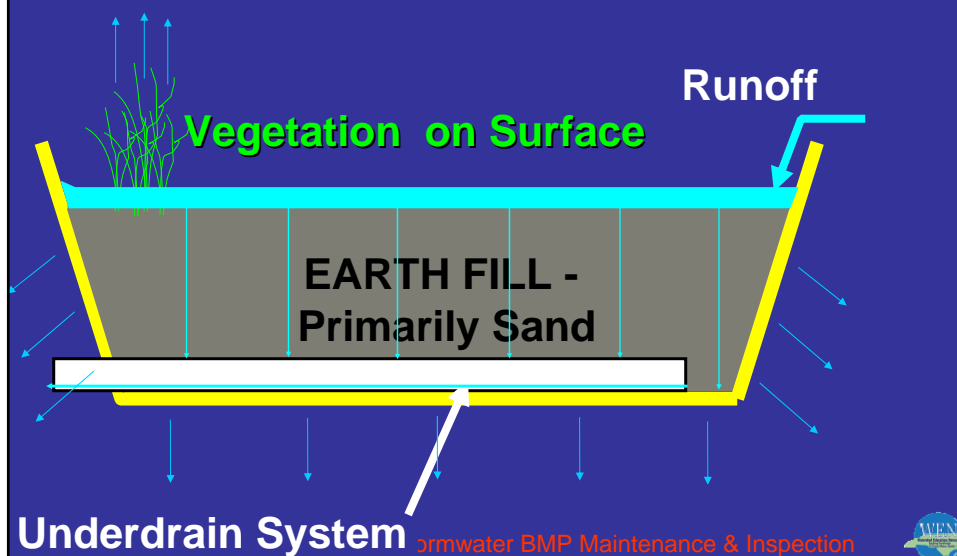

- Fundamentally stormwater BMPs are water quality treatment devices NOT landscape features
- So, *think clean water, not lush landscape*
- Avoid fertilizers and pesticides
- But, plant vigor must be maintained, particularly in BMP critical areas

How Bioretention Works

- Water flows in
- Water is held temporarily – to reduce flooding and to remove pollutants
- Water moves through media for treatment
- Some water evaporates, some transpires through plants, some exfiltrates to surrounding soil, some goes out of underdrains

Bioretention Schematic

Bioswales

- Bioswales have similar standards to bioretention areas except that they are typically long and narrow with widths between 2 and 8 feet
- Bioswales have a maximum ponding depth of 12 inches, with 9 inches preferred

2 Bioswales

How Bioretention Works:

- What the mulch, media, plants, and temporary water storage zone do:
 - Filtration
 - Sedimentation
 - Adsorption (metals, P, stick to particles)
 - Microbial processes – breakdown and denitrification
 - Absorption (acts like a sponge)
 - Evapotranspiration
 - Plant uptake

Major Bioretention Problems

- Sediment clogging and slow or no drainage from improper media selection
- Plant death
- Displacement of water storage zone with sediment or mulch

Bioretention is NOT a sediment basin

- Bioretention is designed to work AFTER construction is completed and the watershed is STABLE

Sediment basin

Designing Bioretention

- Design for first $\frac{3}{4}$ inch of rainfall
- Typically 3-8% of drainage area
- Design for ponding depth of 9 inches
- Design for 12 hour drawdown
- Drop inlet for excess flow
- Plant selection is critical
- Mulch and Maintenance should be specified

Design guidelines

- Design tells you how to maintain practice
- Ask for set of plans to review design
 - For example: water storage depth
 - Need to know average storage depth of bed
 - Need to know the media composition
 - Need to know how quickly the bed is supposed to drain
 - Question: Is the bed meeting its design specifications?

Communication with the owner is important

- Explain bioretention
 - Why it is there
 - How it is designed
 - How it works
 - How to maintain it so it continues to function as designed
 - How long the BMP will last if maintained
 - What the liability is if bed fails

Bioretention Components: The 'bowl' or pit where water ponds

- Maintenance implications:
- What is the underlying soil type?
- Where is the water table
- How was the bed excavated?
- Where is the bed in the landscape?

Bioretention Components: Drop Inlet – for high flow bypass and underdrains

Bioretention Components: Underdrains

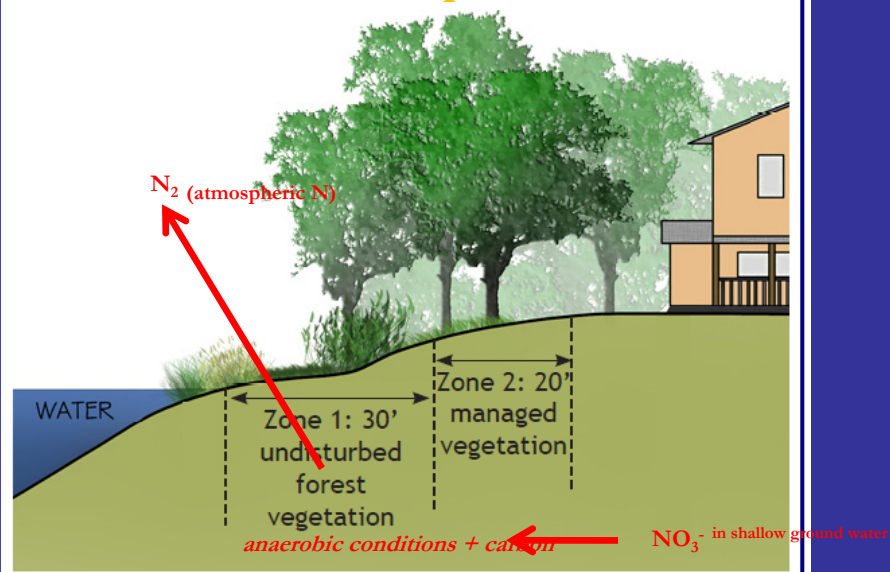

- Serve to drain water from bottom of bed
- Usually paired – redundancy
- Should have clean-out fittings
- May have invert to keep bottom of bed wet
- If located in sandy soil there may be no underdrains

Denitrification

- Natural process in which microorganisms convert nitrate nitrogen (dissolved in water) to harmless atmospheric nitrogen
- Occurs in wet soils that have organic matter
- This is a major N pollution removal mechanism

Denitrification in Riparian Buffers

Bioretention Components: underdrain cleanouts

- Maintenance issues:
- May need to clean out underdrains
- Should be capped
- Should be high enough or sealed to prevent water and debris flow into them

Underdrain cleanouts

Bad

Better

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Improperly designed and poorly placed underdrain cleanout

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

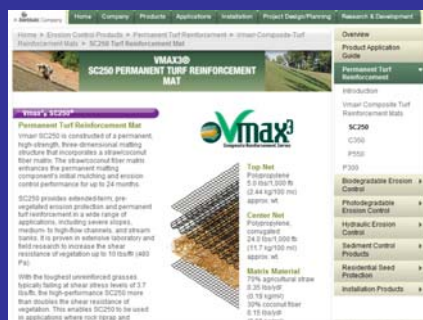

Bioretention Components: Washed Rock, Filter Fabric

- Washed rock helps water move down and sideways to underdrains
- Filter fabric keeps fines, sediment, and tree roots out of underdrains, but may clog

TRM Separation Layer

- Turf reinforcement mat or other matrix to separate media and stone layer that will not glaze with sediment – allows fines to pass through

Bioretention Bed Components: In lieu of filter fabric

| | |
|---|---------------|
| <p>Fill Soil Media: 85 – 88% Washed Sand 8 – 12% Fines (Silt + Clay) 3 – 5% Organic Matter</p> | |
| Washed Sand | 2 to 4 inches |
| Choking Stone (typically #8 or #89 washed) | 2 inches |
| Washed #57 stone or similar, and underdrain pipe. | 6 to 8 inches |
| In-situ soil | |

What if you need to replace the soil or media?

Bioretention Components: Custom Soil

- Chosen for specific porosity – infiltration of stormwater
- May have special characteristics to treat or absorb nutrients and other pollutants
- We create dual purpose soils to treat stormwater and grow plants

Question: What's the Ideal Fill Media?

Simple Components:

- 85-88% washed Sand
- 8-12% Fines (Clay+Silt passing # 200 sieve)
- 3-5% Organics – eg: aged bark fines or peat

Ball Field Mix

- 60% coarse sand
- 40% (red) clay
- Cut with coarse sand to 10% clay
- Fe, Al and Ca in the clay are fixing the P in the stormwater

Even *more* serious

The screenshot shows the website **thestadiumshoppe.com** with the tagline "where you can own a piece of every stadium". The navigation bar includes links for HOME, CATEGORIES, CONTACT US, MY ACCOUNT, PARTNERS, and SHOPPING CART. A search bar is present with the text "Enter search keywords here" and a "Search" button. The left sidebar lists categories under "Categories" including MLB (1865), Ballpark Aerial Posters (34), Ballpark Coasters w/infield Dirt (31), Ballpark Coin Cards (29), Ballpark Etched Glass Photomints (19), Ballpark Game Used Dirt Plaque (29), Ballpark GoldCoin Etched Acrylic (21), Ballpark Infield Dirt Photomints (42), Ballpark Murals (23), Ballpark Pyramids (27), Ballpark Replicas (25), and Ballpark Signature.

The main content area displays the product "Petco Park Infield Dirt Photomint with Infield Dirt" (Product 22/42) for \$89.95. The product description states: "The Highland Mint presents the Petco Park Inaugural Game Photomint with Infield Dirt. INCLUDES AUTHENTICATED PETCO PARK INFIELT DIRT FROM OPENING DAY. A photo of Petco Park on Opening Day (night) is featured with a 24KT gold overlay San Diego Padres Coin and a Coin with Authenticated Infield Dirt from Petco Park that was picked up by Deloitte and Touche on Opening Day. A Numbered Certificate of Authenticity is mounted between the two Coins. Presented in a Team colored, laser cut double matting and a Black molded wood Frame measuring 12" X 15". 8X10 IMAGE." A "larger image" link is provided. Below the description, it says: "The inside of Petco Park Lit up at night. PADRES 24KT GOLD COIN: features the team logo and established date. Authenticated Infield Dirt: The Dirt Authenticated by Major League Baseball (Deloitte and Touche) is carefully placed in a Coin. Each Petco Park Infield Dirt Coin is accompanied by a numbered Hologram, allowing verification of its authenticity on MLB.COM. COA is individually numbered and mounted between the gold coin and Infield Dirt Coin. This is a limited edition of 5000 and is officially licensed by MLB."

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Will Plants Grow in Bark and Sand?

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Standard Nursery Mix 5 parts bark, 1 part sand

Replacement Soil Examples

- 'Ball field' mix
 - 85% sand, 10% fines, 2-5% OM
 - \$16.20/cu.yd or \$12/ton (2011 quote) wgt 2700 lbs/cy
- Permatil mix
 - 80% Permatil, 10% approved compost, 10% pine bark fines
 - \$37.50/cu.yd. or \$48/ton FOB(2011 quote) wgt 1565 lbs/cy

Can Compost be used in BMPs?

- Remember, BMPs are water quality and quantity treatment devices, NOT landscape features
- Soil test all components for pH and P levels
- Compost can have very high nutrient levels

Use compost to remediate poor soils, do not use inside BMPs

Bioretention Components: Mulch

- Prevents weeds from sprouting
- Adds organic matter, active zone for micro-organisms
- Conserves moisture during dry periods
- Cools soil
- Should be attractive
- Should not float

We use shredded hardwood bark, You use Gorilla Hair

Figure 18. Gorilla hair mulch.

Mulch Sources...

DECORATIVE BARKS / MULCH / COMPOST

HOME ABOUT US GALLERY SPECIALS PRODUCTS TESTIMONIALS RESOURCES LOCATE US FAQs

Decorative bark (mulch) has a variety of uses. We stock a number of colors, sizes and textures.

What can bark / mulch do for you?

- o Give a finished look to your landscaping while defining borders and pathways
- o Suppress and eliminate weeds when used properly in conjunction with landscape fabric
- o Conserve water by retaining moisture in soil and eliminating water evaporation (saves money\$)
- o Insulate roots from extreme temperatures by keeping roots warm in winter and cool in summer
- o Promotes growth and fertility to help plants grow stronger, healthier and full of rich-vibrant color

One yard of bark covers approximately 150 square feet 2 inches in depth

Product Specifications

Product: Decorative Bark
Name: Red WoodGorilla Hair
Product #: PV0616
Available Sizes: Shredded

Description: Finely Shredded preferred for Native Landscaping
Natural rich reddish/brown
Coverage: Per Yard Sq. Ft. 140-180
Sales Unit: Cubic Yards

Coverage is an estimate only. Installation techniques can vary coverages.

NC STATE UI

Inspection

Mulch Management

- Mulch should be renewed as needed
- Maintain mulch depth of 3 inches
- Mulch will darken over time, can be 'fluffed' to improve appearance and infiltration
- Too much mulch displaces water storage and kills plants

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Bioswale Mulch Management

- If water flows *through* the bioswale mulch may wash and float and cause problems
- Possible solutions:
 - check dams
- Plant dense vegetation to slow and spread water flows – grasses, lirope, other spreading vegetation

Maintenance Trigger: Mulch

- Mulch renewal – if oxidized or compacted
- Mulch removal – if too deep
- Mulch replacement – if contaminated or clogged
- Mulch (and media) contamination 'Hot Spots' are where water first enters BR cell, this is where you find metals, hydrocarbons in highest concentrations

Pine Bark Will Float and Wash

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Wood Chips Will Float

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Inspect Outlets Regularly

- Remember, the bioretention beds probably contain the only drains in the parking lot or landscape
- All mulch floats some at first
- Clogged outlets = flooded parking lots and landscapes

Maintenance Trigger Outlet clean-off

- Clean off outlets after every storm – can clog with mulch or trash

Bioretention Components: Plant Material

- Provides uptake of nutrients and water
- Provides carbon for denitrification
- Stabilizes bed
- Should be an attractive part of landscape

Plants for Bioretention

- Plant selection is much wider now that we have developed consistent, well-drained custom media for bioretention
- Early-on, many plants drowned and died

Three types of BR beds...

- Shrub/Tree

– Grass

- Natural

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Natural

- Not too common
- Dry stream bed look is good
- Totally natural = neglect = failure
- BR beds need maintenance

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Tree/Shrub beds

- Most common form
- Less maintenance than turf

San Diego BMP Plants

- 1. Plant materials must be tolerant of summer drought, ponding fluctuations, and saturated soil conditions for 10 to 48 hours.
- 2. It is recommended that a minimum of three tree, three shrubs, and three herbaceous groundcover species be incorporated to protect against facility failure from disease and insect infestations of a single species. Plant rooting depths must not damage the underdrain, if present. Slotted or perforated underdrain pipe must be more than 5 feet from tree locations (if space allows).
- 3. Native plant species or hardy cultivars that are not invasive and do not require chemical inputs are recommended to be used to the maximum extent practicable.
- 4. Shade trees should be free of branches below the following heights:

| Caliper (in) | Height (ft) |
|--------------|-------------|
| 0.5 to 2.5 | 5 |
| 3 | 6 |

1. (+) Seasonal Flooding for bioretention areas is typically 9" deep (maximum) for up to 72 hours (the typical design infiltration period for a bioretention area). If parts of the bioretention area are to be inundated for longer durations or greater depth the designer should develop a plant palette with longer term flooding in mind. Several of the species listed as tolerant of seasonal flooding may be appropriate, but the acceptability of each species considered should be researched and evaluated on a case by case basis.

2. (C) Plants that are not listed as tolerant of seasonal flooding may be used in seasonally moist areas, but may not survive in locations that will be inundated during and after storm events.

3. Before specifying plants that are listed, availability should be confirmed by local nurseries. The designer may need to specify on plans that certain species are to be contract grown and that the contractor will need to make these arrangements well in advance of planting, as certain plants may not be available on short notice.

FINAL DRAFT

Plant Placement & Replacement in Bioretention

Maintenance Trigger: Plant replacement

- Replace dead plants ASAP with more tolerant plants
- Plant new plants on mounds or edges of bed for aeration

Staking ?

Staking

- Bioretention soils are usually shallow and provide very little root support for trees
- Plant trees on edges of bed

Pruning/Plant Density

- BR beds need to be 'open' to allow:
- Trash pick-up
- Sunlight penetration for E/T, pathogen kill
- Lines-of-sight
- Safe parking lots

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Too Dense?

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

???

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

No Plants

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Bacterial Contamination of Bioretention Beds?

- Remember, all runoff flows to the bioretention bed
- Sunlight helps kill bacteria and other microorganisms

Trash Pickup

- Remember, all parking lot trash flows to the bioretention beds

Turf for Bioretention

Advantages of Turf

- Simple installation
- Very stable material (unlike mulch)
- Easy routine maintenance
- Simple renovation
- Easy to remove trash from turf
- Excellent sunlight penetration
- Bagged clippings remove nutrients and avoid outlet clogging

Potential turf BR problems

- Uninformed maintenance – fertilization
 - Turf will not need fertilizer in BR
 - Rainfall gives the equivalent of 117 pounds per acre of 10-10-10 per year in NC
- Clippings can clog drop inlets
- Cool season grasses can die under drought and heat stress
- pH lowers over time and grass dies out

Grassed Bioretention

Avoid clay-based sod

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Washed Sod...

What's the Dirt on Washed Sod?

*Bridget Ruemmele, Ph.D., and
Noel Jackson, Ph.D.
University of Rhode Island
Kingston, R.I.*

Turf establishment using washed sod has increased dramatically with the introduction of equipment to strip soil from the turf prior to shipment and establishment. This is beneficial for establishment of sod in locations containing soil types differing from those on production fields. Removing the original soil avoids deleterious interfaces between the two soils, which may impede water infiltration and proper rooting. Washed sod may also weigh less, reducing shipping costs. An added benefit of washed sod is its potential to establish faster than sod with soil attached.

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Mowing regimens?

Avoid scalping grass

Table 2. Guidelines for Mowing Heights

| Lawngrass | Height after Mowing (inches) |
|--|------------------------------|
| Bermudagrass | 3/4 to 1 1/2 |
| Zoysiagrass | 3/4 to 1 1/2 |
| Centipedegrass | 1 to 1 1/2 |
| Kentucky bluegrass, fine fescue, or perennial ryegrass | 1 1/2 to 2 1/2 |
| Tall fescue | 2 1/2 to 3 1/2 |

Plant Removal

- Are we at the point where we want to harvest plants from stormwater control measures to remove nutrients?

Phytoremediation: Using Plants To Clean Up Soils

When it comes to helping clean up soils contaminated with heavy and toxic metals, nature has [ARS](#) plant physiologist Leon V. Kochian to thank.

During 13 years of research at the U.S. Plant, Soil, and Nutrition Laboratory at Ithaca, New York, Kochian has become an authority on mechanisms used by certain plants to take up essential mineral nutrients and toxic heavy metals from soils. He has also characterized strategies some plants use to tolerate toxic soil environments.

Kochian is an international expert on plant responses to environmental stress, plant mineral nutrition, and use of plants to clean up or remediate soils contaminated with heavy metals and radioisotopes.

Besides providing important new information on how to use plants in this practical way, Kochian's

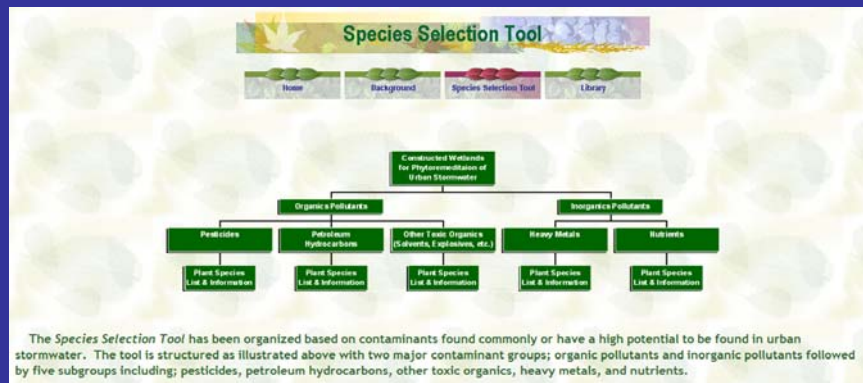

Stormwater Phytoremediation Species Guide

Welcome to the Stormwater Phytoremediation Species Guide!

Stormwater Phytoremediation Species Guide was designed and developed to aid scientists and engineers in the selection of potentially successful aquatic species for use in constructed wetlands to phytoremediate urban stormwater runoff. This guide contains not only a *Species Selection Tool* but also background information on phytoremediation and a library of resources used in this guide.

Heavy Metals

This page lists a number of researched aquatic wetland species that could be used in constructed wetlands for the treatment of urban stormwater that contains heavy metals. The heavy metals of primary interest here include cadmium (Cd), copper (Cu), lead (Pb), and zinc (Zn) because of their high frequency of concern in urban stormwater. The contaminants listed here however are most likely not the only metals that phytoremediation in a constructed wetland can treat and it is speculated that the species listed here and others not listed have far ranging application to many other metal types. Also shown below are photographs of the species listed here.

| Common Name(s) | Scientific Name | Contaminants | References |
|------------------|----------------------------------|----------------|-------------------|
| Water Zinnia | <i>Wedelia trilobata</i> | Cd | Qian et al, 1999 |
| Smartweed | <i>Polygonum hydropiperoides</i> | Cu, Pb, Cr | Qian et al, 1999 |
| Parrot's Feather | <i>Myriophyllum brasiliense</i> | Cd | Qian et al, 1999 |
| Water Lettuce | <i>Pistia stratiotes</i> | Cu | Qian et al, 1999 |
| Umbrella Plant | <i>Cyperus alternifolius</i> | Cu, Cd, Pb, Zn | Cheng et al, 2002 |

Hydrocarbons

Petroleum Hydrocarbons

Home Organic Pollutants Inorganic Pollutants

This page lists a number of researched aquatic wetland species that could be used in constructed wetlands for the treatment of urban stormwater that contains petroleum hydrocarbons. The contaminants listed here are most likely not the only petroleum hydrocarbons that phytoremediation in a constructed wetland can treat and it is speculated that the species listed here and others not listed have far ranging application to many other petroleum hydrocarbon types. Also shown below are photographs of the species listed here.

| Common Name(s) | Scientific Name | Contaminants | References |
|------------------------------------|----------------------------------|---|--|
| Hybrid Poplar (Eastern Cottonwood) | <i>Populus deltoides x nigra</i> | Benzene, Toluene, Ethylbenzene, m-Xylene, MTBE | Williams, 2002, Burken et al., 1998 |
| Weeping Willow | <i>Salix babylonica</i> | Ethanol, Benzene | Williams, 2002, Corsenull et al., 2001 |
| Smooth Cordgrass | <i>Spartina alterniflora</i> | Crude oil, No. 2 Fuel Oil | Lin et al., 1998, Lin et al., 2002 |
| Marshhay Cordgrass | <i>Spartina patens</i> | Crude oil | Lin et al., 1998 |
| Common Club-Sulrush | <i>Scirpus lacustris</i> | Polycyclic Aromatic Hydrocarbons (PAHs), Benzene, Toluene, Ethylbenzene, Xylene | Machato et al., 1999 |

Bioretention is a nutrient rich environment

• Then...

• Now

Lime, or acidify if needed
Fertilizer, seldom if ever

Ponding zone – set by elevation of drop inlet, 9-12 inches normally

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Maintenance Trigger: Dirty watershed

- Dirty/poorly maintained watersheds = clogged bioretention beds

Why sediment accumulation is bad

Seals bioretention cell, converts bioretention into a wetland

Takes away water storage volume

Good housekeeping

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Beware of outparcel neglect and development

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Ponding zone full of sediment

Infiltration Rates

- 1-2 inches per hour is optimum
- Need residence time to remove pollutants
- Will slow over time
- Media with 12% fines is used for targeted N removal
- 8% fines is used for targeted P removal
- 10% fines is a good average

Key Maintenance Test

- Visit site within 24 hours of 1 inch rain event (avg 11-12 /yr)
- If water is still ponded site has clogged
- Action needed
- Do this once or twice per year

Nashville Wal Mart Case Study

BR Inspection

#1 Get a set of plans

- How deep is ponding zone?
- How deep is media?
- Is there an IWS (internal water storage – elbow in underdrain)?
- Media composition?
- Plants?

BR Inspection

2 Look at surface of bed

- Look for sediment
- Look at mulch
- Look at watershed – look for signs of instability

3 Look for evidence of underdrain drainage

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

BR Inspection # 4 Look at plants

- Are they dead or alive?
- Why?

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

5 Pull soil cores

Pull 10 soil cores once per year –
examine for mottling or odor

BR Inspection #6 dig a hole

Examine the soil

#7 Time bed drainage

- Visit site within 24 hours of 1 inch rain event (avg 11-12 /yr)
- If water is still ponded site has clogged
- Action needed
- Do this once or twice per year

Beds That Drain too Fast???

- Look for holes in sides of drop inlet
- Look for broken underdrain cleanouts
- Look for sinkholes in bed indicating short circuiting
- Were underdrains properly grouted into side of riser structure?

Stormwater BMP Maintenance & Inspection

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Sinkhole next to drop inlet

Poorly grouted underdrain

Water my rain garden?

- Right after planting
- First growing season
- During droughts later

Inspection and Maintenance Checklist for a Bioretention Area

Property Address: _____ Property Owner: _____
 Treatment Measure No.: _____ Date of Inspection: _____ Type of Inspection: ☐ Monthly ☐ Pre-Wet Season ☐ End of Wet Season
☐ After heavy runoff ☐ Other: _____
 Inspector(s): _____

| Defect | Conditions when Maintenance is Needed | Maintenance Needed? (Y/N) | Comments ^a | Results Expected when Maintenance is Performed |
|----------------------------------|---|---------------------------|-----------------------|--|
| 1. Standing water | Water stands in the bioretention area between storms and does not drain within 24 hours after rainfall. | | | There should be no areas of standing water once inflow has ceased. Any of the following could apply: sediment or trash blockages removed, improved grade from head to foot of bioretention area, scarify media surface, flush underdrains. |
| 2. Trash and debris accumulation | Trash and debris accumulated in the bioretention area and around the inlet and outlet. | | | Trash and debris removed from bioretention area and disposed of properly. |
| 3. Sediment | Evidence of sedimentation in bioretention area. | | | Material removed so that there is no clogging or blockage. Material is disposed of properly. |
| 4. Erosion | Channels have formed around inlets, there are areas of bare soil, or other evidence of erosion. | | | Obstructions and sediment removed so that water flows freely and disperses over a wide area. Obstructions and sediment are disposed of properly. |
| 5. Vegetation | Vegetation is dead, diseased or overgrown. | | | Vegetation is healthy and attractive. |
| 6. Mulch | Mulch is missing or patchy. Areas of bare earth are exposed or mulch layer is less than 3 inches deep. | | | All bare earth is covered, except mulch is kept 6 inches away from trunks of trees and shrubs. Mulch is even, at a depth of 3 inches. |
| 7. Sod (for sodden bioretention) | Sod is dead or requires mowing | | | Sod is healthy and maintained at least 3 inches in height. |
| 8. Inlet/outlet | Sediment accumulations | | | Inlet/outlet is clear of sediment and allows water to flow freely |
| 9. Miscellaneous | Any condition not covered above that needs attention for the bioretention area to function as designed. | | | Meet the design specifications. |

^a Describe the maintenance completed; if the needed maintenance was not conducted, note when it will be done.

FINAL DRAFT

Inspection, Operation & Maintenance of Infiltration Trenches

Scott Struck, Ph.D., PWS

Inspection & Maintenance Workshop
April 6th, 2011

Infiltration Trench Description

- Long, narrow, often rock filled trench for small drainage areas designed to store and infiltrate runoff
- Water is stored in the void spaces between the rock and water exfiltrates through the sides and bottom of the trench
- Include pretreatment swales, forebays, or filter strips to prevent sedimentation and prolong life of BMP
- Need 10 ft. separation between bottom of basin and seasonal high water table

Infiltration Trench Examples

Hybrid Trench Design

Hybrid Trench Design

Hybrid Trench Design

Infiltration Trenches - Advantages

- **Hydrologic benefits:**
 - reduce peak runoff rates for more frequent storms,
 - reduce runoff volumes, and
 - recharge groundwater if soil conditions allow
- **Useful for space limited applications**
- **Integrated into transportation ROW**
- **Can be used as landscaping feature**

Infiltration Trenches - Disadvantages

- **Infiltration trenches may have limited treatment**
- **When located in high infiltration rate areas - short residence time**
- **Primarily recharge groundwater**
- **Can have higher failure rate due to clogging if not designed and maintained**

Typical Design Cross Section

Typical Design Cross Section

Erosion Control

- Inspect flow entrances, ponding area, and surface overflow areas periodically during the rainy season
- replace gravel and soil in areas if erosion has occurred and stabilize

Expected Flow Velocities

Inlet

- The inlet to the infiltration trench should be inspected after the first storm of the season and then monthly during the rainy season
 - check for sediment accumulation and erosion
 - accumulated sediment that impedes flow into the infiltration trench should be removed and properly disposed

Inlets and Pretreatment

Inlets and Pretreatment

Inlet Design and Other

Outlets

Overflow and Underdrains:

- **Sediment accumulation in the overflow device or underdrain system can cause prolonged ponding**
 - more than 72 hours, the underdrain system should be flushed with clean water until infiltration is restored
- **The underdrain systems should be designed so that it can be flushed and cleaned as needed**
- **Outlets should be inspected after the first storm of the season, then monthly during rainy season**
- **Remove sediment and prevent mulch/media/rock accumulation around the overflow**

Outlets

Outlets

- Ponded water for longer than 48 hours...

Underdrains

General Maintenance

If Vegetation....

- You May Need to Irrigate

Maintenance Guidance

| Task | Frequency | Maintenance notes |
|----------------------|---|--|
| Inlet Inspection | Once after first rain of the season, then monthly during the rainy season | Check for sediment accumulation to ensure that flow into the system is as designed. Remove any accumulated sediment. |
| Outlet Inspection | Once after first rain of the season, then monthly during the rainy season | Check for erosion at the outlet and remove any accumulated sediment. |
| Miscellaneous upkeep | 12 times/year | Tasks include trash collection, spot weeding, and removing mulch from overflow device. |

Fact Sheets

Site Assessment

Infiltration trenches are not suited for existing medians or shoulders and for locations with limited space such as edges or medians of parking lots. When infiltration is incorporated into existing impervious areas, such as parking lots, it is important to allow sufficient space to ensure the infiltration trench. Rates of infiltration are required to be greater than 0.5 inch per hour, in soils with clay-based or compacted soils, the infiltration trench should be designed with subsurface storage or an underdrain. Furthermore, with a vegetated filter strip, it is suggested for infiltration trenches to remove sediment and prevent clogging.

Minimum Area: Less than 2 acres.

Vegetation Types: Infiltration trenches are narrow with a linear configuration and are intended to fit along the edge of parking lots and roads. They can vary from 2 to 5 feet in width.

Underground utilities: A complete utility inventory should be done to ensure that site development will not interfere with or affect utilities. In many cases, infiltration trenches can be placed in the landscape to prevent conflicts with utilities. In cases where utilities cannot be avoided, care should be taken to prevent effects from infiltration or saturation to utilities by using hydraulic separating tanks to prevent infiltration near the utility.

Existing Buildings/Structures: Must be a minimum of 10 feet from water supply wells and septic system drain fields and 10 feet from any structures.

Water Table: Installed infiltration trenches must not be used where the seasonally high water table or confining layer is less than 10 feet below the bottom of the infiltration trench.

Soil Type: Soil testing should be performed at the site by a licensed soil scientist or geotechnical engineer to determine the infiltration rate of the site soils. The soil media within the infiltration trench should be highly permeable (an infiltration rate of at least 0.5 inch per hour) and have an appropriate amount of organic material to support plant growth (e.g., loamy sand mixed thoroughly with an organic material).

Areas of Concern: Infiltration trenches are not supported by sites with known soil contamination or hot spots, such as gas stations. An impermeable membrane can be used to prevent infiltration within areas of concern.

Design Considerations & Specifications:

Topography: Drainage area should be consistently established before beginning on site. Longitudinal slope should be less than 2 percent. Slopes can exceed 2 percent, but check dams should be used so that one continuous section does not exceed 2 percent. Check dam slope should not exceed 5 percent.

Flow regulation: Inflow must be non-storm runoff flow (i.e., not per second for green roofs or low energy dissipating devices). Infiltration trenches can be used effectively in areas with slopes from 2 to 5 percent by installing check dams to prevent storm flow velocities.

Pre-treatment: Infiltration trenches can be used in conjunction with pretreatment BMPs such as filter strips or other sediment capturing devices to prevent sediment from clogging the trench. Appropriate pretreatment will be needed to enhance filtration and sedimentation of larger particles, and debris from heavily trafficked areas.

Shallow ponding area: Pooled water must completely drain into the soil within 24 hours, but 12 hours is preferred. If most drains to a level below the soil media (2 to 3 feet) within 24 hours.

Vegetation: Infiltration trenches are intended to be installed in areas where vegetation might not be feasible, such as the edge of a parking lot or in right-of-way where vegetation could prevent appropriate site drainage or where survival would be minimal. In such cases, the surface of the infiltration trench should be established with gravel as a diversion device. In cases where vegetation is desired, organic matter can be used as an additive to help establish vegetation and should be maintained.

Media Layers: Media depth must be a minimum of 2 feet. The soil media in the infiltration trench should be highly permeable (at least 0.5 inch per hour) and have an appropriate amount of organic material to support plant growth (e.g., loamy sand mixed thoroughly with an organic material). If existing soils do not meet the criteria, a substrate media must be used. A deeper soil media depth will allow for a smaller surface area footprint.

Underdrain system: An underdrain must be installed if runoff and drainage is less than 0.5 inch per hour. The underdrain pipe should be at least 6 inches in diameter and installed at a 0.5 percent minimum slope. An underdrain must be installed if the infiltration trench is less than 10 feet of a sidewalk, steep slope, driveway, or other paved area.

Overflow system: Select the appropriate overflow or bypass method. On-line BMPs require an overflow system for passing larger storms. Off-line BMPs do not require an overflow system but do require a bypass for larger storms. The overflow device and the point where storm water would overflow the trench and a diversion structure.

Maintenance Considerations

| Task | Frequency |
|----------------------|---|
| Inlet inspection | Once after first rain of the season, then monthly during the rainy season |
| Outlet inspection | Once after first rain of the season, then monthly during the rainy season |
| Miscellaneous upkeep | 12 times/year |

| Drainage Area (sq ft) | Infiltration Rate (in/hr) | Water Table Depth (ft) | Depth to BMP (ft) | Flow Rate (gpm) | Flow Rate (cfs) |

| 5,000 | 5.0 | 0.035 |

Functional unit processes:

- Microbial activity
- Evapotranspiration
- Denitrification
- Volatilization
- Infiltration
- Recharge
- Subsidence
- Chemical degradation

| Task | Frequency |
|----------------------|---|
| Inlet inspection | Once after first rain of the season, then monthly during the rainy season |
| Outlet inspection | Once after first rain of the season, then monthly during the rainy season |
| Miscellaneous upkeep | 12 times/year |

Background

An infiltration trench is an excavated, long, narrow trench lined with filter fabric and backfilled with stone or a bioinert media that allows storm water to infiltrate into subsurface soils. Runoff that enters into the soils is stored in the void spaces between the stones or is infiltrated into the ground. In addition to reducing runoff volume, infiltration trenches restore fine sediment and allow for groundwater recharge. Infiltration trenches can be integrated naturally into landscaping and when properly maintained, can enhance aesthetics.

Infiltration trenches are effective in removing:

- Sediments
- Trash
- Bacteria
- Organics
- Nutrients
- Metals
- Oil and grease

Infiltration Trench

Inspection and Maintenance Checklist

Inspection and Maintenance Checklist for an Infiltration Trench

Property Address: _____ Property Owner: _____
 Treatment Measure No.: _____ Date of Inspection: _____ Type of Inspection: ☐ Monthly ☐ Pre-Wet Season ☐ End of Wet Season
☐ After heavy runoff ☐ Other _____
 Inspector(s): _____

| Defect | Conditions when Maintenance is Needed | Maintenance Needed? (Y/N) | Comments ^a | Results Expected when Maintenance is Performed |
|----------------------------------|---|---------------------------|-----------------------|---|
| 1. Standing water | When water stands in the infiltration trench between storms and does not drain within 24 hours after rainfall | | | There should be no areas of standing water once inflow has ceased. Any of the following can apply: sediment or trash blockages removed, improved grade, scaly media surface, flush underdrains. |
| 2. Trash and debris accumulation | Trash and debris accumulated in the infiltration trench and around the inlet and outlet | | | Trash and debris removed and disposed of properly |
| 3. Sediment | Evidence of sedimentation | | | Material removed so that there is no clogging or blockage. Material is disposed of properly. |
| 4. Erosion | Channels have formed around inlets, there are areas of bare soil, or other evidence of erosion | | | Obstructions and sediment removed so that water flows freely and disperses throughout the infiltration trench. Obstructions and sediment are disposed of properly. |
| 5. Surface materials | Material is missing or patchy, areas of bare earth are exposed | | | All bare earth is covered, except mulch is kept 6 inches away from trunks of trees and shrubs. Mulch is even, at a depth of 3 inches. |
| 6. Inlet/outlet | Sediment accumulations | | | Inlet/outlet is clear of sediment and allows water to flow freely |
| 7. Miscellaneous | Any condition not covered above that needs attention for the infiltration trench to function as designed | | | Meet the design specifications. |

^a Describe the maintenance completed; if the needed maintenance was not conducted, note when it will be done.

FINAL DRAFT

Facility Field Card?

GENERAL MAINTENANCE CARD

BMP Site: RC-5
 Location: St. George Road (Richmond Creek Watershed)
 Facility: Constructed Storm Water Wetland

Major Areas of BMP:

- 1) Forchey (see Location A)
- 2) Micropond (see Location B)
- 3) Outlet Structure (see Location C)
- 4) Low Marsh (see Location D)
- 5) High Marsh (see Location E)

SHORT-TERM MEASURES (FREQUENCY: DAILY TO MONTHLY)

Drainage Issues:

- 1) Inspect E.D. wetland surface area.
- 2) Visually inspect the inlet pipe.
 - Remove accumulated debris by hand or skimmer; use waders if required.
 - Repair cracks using a sealant, if required.
- 3) Inspect the 30-foot long weir wall (see Location C on Fig. 1).
 - Complete Dam Inspection Checklist (attached).
 - Repair cracks/damage, if present.
 - If debris is lodged in notch, remove manually; use waders if required.
 - Secure weir gate by tightening bolts.
- 4) Inspect adjacent catch basin grates and manhole covers.
 - Remove accumulated debris.
 - Secure manhole covers using a hook.

Landscaping Issues:

- 5) Inspect overall condition of installed vegetation.
 - Remove vegetative invasives manually; ensure root removal. Contact Restoration Specialist for advice.
 - Relocate herbivorous critters or provide exclusion devices; consult Restoration Specialist if required.
 - Cut grass located along the site perimeter or maintenance accessway.
 - Trim or remove specified trees, as required.

Perimeter Treatments:

- 6) Inspect overall condition of the perimeter treatment items.
 - Remove accumulated litter/debris by hand.
 - Promptly notify DRP police regarding illegal dumping issue.
 - Lubricate locks and hinges, as required.
 - Repair damaged sidewalks, as required.
 - Replace/replace wood chips on accessway, as required.

MODERATE-TERM MEASURES (FREQUENCY: SEMI-ANNUAL)

Drainage Issues:

- 1) Measure the sediment depth in forchey/micropond (see Locations A and B on Fig. 1).
- 2) Inspect for unstable embankments.

5) Inspect for herbivore damage.

- Repair burrows/damage created by herbivorous critters.

LONG-TERM MEASURES (FREQUENCY: ANNUAL)

Drainage Issues:

- 1) Vactoring Activity
 - Vector sediment from forchey/micropond.
 - Vector sediment from adjacent catch basins.

LONG-TERM MEASURES (FREQUENCY: 10-YEAR INTERVAL)

Drainage Issues:

- 1) Vector accumulated sediment from entire E.D. wetland.

Note: Fill out the attached General Inspection Checklist during inspection of the

Questions?

Maintaining Permeable Pavement

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Why Permeable Pavement ?

- State Law (in NC)
 - State especially promotes it in Sandy Soils
- Allows stormwater to infiltrate pavement and soak into the soil – reduces flooding
- Best sited on sandy soils that allow infiltration
- It can be an attractive surface – texture/color
- Can remove pollutants

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Goldsboro PICP Lot: Zn Concentrations

But...

- Not suitable for heavy traffic or heavy vehicles but excellent for parking spaces
- More expensive to make work in “tight” soils
- Stormwater must be relatively ‘clean’ for permeable pavement to work

If not maintained, “permeable”
pavement becomes Impervious

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Remember our Wary
Regulator/Engineer...

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

The Many Forms of Permeable Pavement (variable maintenance)

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

What is Permeable Pavement?

- AKA: Pervious pavement, porous pavement
- Several Types:

Permeable Interlocking Concrete Pavers (PICP)

Concrete Grid Pavers (CGP)

Stormwater BMP

Coronado Boathouse

Permeable Pavement - Clean the Catchment: Blowing

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Permeable Pavement Clogging

Where does it happen?

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Depth of Clogging Apparent

Different PP Systems Clog @ Different Locations

- PICP – Top 40mm
- CGP – Top 5 to 15mm
- Pervious Concrete and Pervious Asphalt – Bottom of Cut (may be 100-200mm from surface)

Permeable Pavement Maintenance: Sweeper/Vacuum Truck

Different Types of
Sweepers for Different
Types of Permeable
Pavements:

Mechanical Sweeper vs.
Regenerative Air
Sweeper vs. Vacuum
Sweeper

NC STATE UNIVERSITY

Stormwater

Standard Mechanical Broom Sweeper Mechanism (e.g., Elgin Pelican and Eagle)

NC STATE UNIVERSITY

Stormwater: Civil Maintenance & Inspection

Reach of Bristles

Mechanical Sweeper Good only for CGP

But, Bristle
Penetration
not deep for
some types of
pavements

Regenerative Air Street Sweeper

Preventative Maintenance

- Regenerative Air Street Sweeper good for preventative maintenance for:
 - PICP
 - Pervious Concrete
 - Pervious Asphalt
- May not work for Restorative Maintenance

Most Powerful Sweeper: The Vac Truck

Potential for
Restorative
Maintenance

Vacuum Sweeper Results

NC STATE UNIVERSITY

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Permeable Pavement Maintenance: Water Blasting? Yeah... No.

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Permeable Pavement Problems: Weeds and Moss

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Grass growth is a sign of Sediment Accumulation

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Permeable pavement weed control

- Systemic herbicides like Roundup - Preferred
- Flame weed killers – LP gas fueled – Be careful. Could ignite Concrete!

Grassed Permeable Pavement

You might have to mow it!

Permeable pavement weed control “dos and don’ts”

- Don’t pull large weeds – can pull up pavers and fill gravel
- Do control weeds when they are small – if killed when large, dead weed biomass can clog pavement
- Some permeable pavements are meant to be vegetated – be careful

Permeable Pavement Problems: Oil and Grease

Emulsify with Biodegradable Detergent?

Add Stain Remover...

Let it soak, then water blast

Perhaps Coating Used to Prevent Stains (\$)

Permeable Pavement Maintenance Tasks and Schedule

| <u>TASK</u> | <u>SCHEDULE</u> |
|---|-------------------------------|
| Regular sweeping and vacuuming | Semi-annual to Quarterly |
| Gravel replacement | Post-Vacuuming |
| Oil and grease cleaning | As needed per clientele |
| Avoidance of landscape debris (grass clippings, leaves) | Each landscape maintenance |
| Spray/ _{Flame} Weeds and Moss with Herbicides | Monthly during growing season |
| Adjoining land and watershed stabilization | Keep watch |

Planter Box Maintenance

Why Planter Boxes?

- A water quality and quantity BMP is needed or required
- The site is dry – ~~no shallow water table,~~ no running water
- The watershed is stable – low probability of sediment deposition
- The 'look' of a landscape bed is desired, with shrubs, trees, or grass
- Infiltration is not feasible
- Limited space (directly adjacent to a structure)

Notes:

UD: Underdrain

a. If lined, see the Planter box column

b. If lined, see the Sand filter with underdrain column

c. For tank outlet and overflow

How Planter Boxes Work

- Water flows in
- Water is held temporarily – to reduce flooding and to remove pollutants
- Water moves through media for treatment
- Some water evaporates, some transpires through plants, ~~some exfiltrates to surrounding soil~~, most goes out of underdrains

Planter Box Schematic

How Planter Boxes Work:

- What the mulch, media, and plants do:
 - Filtration
 - Sedimentation
 - Adsorption (metals, P, stick to particles)
 - Microbial processes – breakdown and denitrification
 - Absorption (acts like a sponge)
 - Evapotranspiration
 - Plant uptake
- 

Major Planter Box Problems

- Sediment clogging and slow or no drainage from improper media selection
- Plant death
- Inlet clogging causing backup onto impervious areas

Designing Planter Boxes

- Design for first $\frac{3}{4}$ inch of rainfall
- Typically drainage areas less than 0.35 acres
- Design for max. ponding depth of 9 inches
- Minimum 2 feet of soil media
- Design for 12 hour drawdown
- Vertical riser and overflow for excess flow
- Hydraulic Restriction Layer
- Plant selection is critical
- Mulch and Maintenance should be specified

Design guidelines

- **Design tells you how to maintain practice**
- **Ask for set of plans to review design**
 - For example: water storage depth
 - Need to know average storage depth of bed
 - Need to know the media composition
 - Need to know how quickly the bed is supposed to drain
 - Question: Is the bed meeting its design specifications?

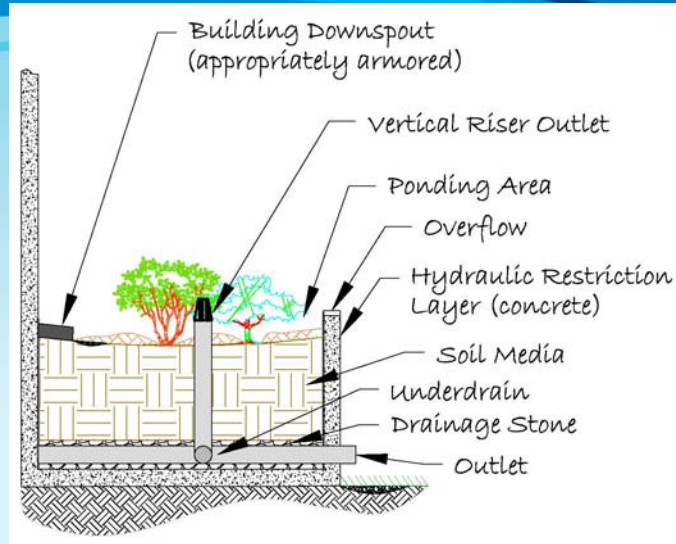

Communication with the owner is important

- **Explain planter box**
 - Why it is there
 - How it is designed
 - How it works
 - How to maintain it so it continues to function as designed
 - How long the BMP will last if maintained
 - What the liability is if bed fails

Planter Box Components:

Planter Box Components: The 'bowl' or pit where water ponds

- **Maintenance implications:**
- **What is the media type?**
- **Effect on adjacent surfaces?**

Planter Box Components: Vertical Riser– for overflow and underdrains

Planter Box Components: Overflow– for high flow bypass

Source: Low Impact Development Center, Inc.

Planter Box Components: Underdrains

- Serve to drain water from bottom of bed
- Moves water away from foundations
- Usually paired – redundancy
- Should have clean-out fittings

Planter Box Components: underdrain cleanouts

Maintenance issues:

- May need to clean out underdrains
- Should be capped
- Should be high enough or sealed to prevent water and debris flow into them
- Vertical riser can serve as the cleanout (cap with "spider cap")

Planter Box Components: Washed Rock, Filter Fabric

- Washed rock helps water move down and sideways to underdrains
- Filter fabric keeps fines, sediment, and tree roots out of underdrains, but may clog

TRM Separation Layer

- Turf reinforcement mat or other matrix to separate media and stone layer that will not glaze with sediment – allows fines to pass through

Planter Box Bed Components: In lieu of filter fabric

Inspect Outlets Regularly

- Remember, All mulch floats some at first
- Clogged outlets = ponded water

Backpack Sprayer – If “Covered Up”

Can I Let the Blind Swale Fill in with Wetland Veg?

- Yes (sometimes).
- Particularly in out-of-the-way LS locations
 - Away from people
- Provide modest additional N removal benefit
- Want to “oversize” the wetland swale

Inspect and Repair Damaged Level Spreader

- Level Spreaders can erode over time
 - Especially if constructed of earth
 - Rock level spreader can fall apart
- They must be repaired if the level lip has been damaged

BAE Stormwater Engineering Group

"We Bring Engineering to Life"

NC STATE UNIVERSITY

Large Stemmed Vegetation and Tree Removal

- Trees on level spreader lip cause water to re-concentrate
- Remove trees, shrubs and large stemmed vegetation from "Level Lip"
 - Large stemmed vegetation and trees can obstruct flow over lip
 - Ideally, only grass and small plants grow on level spreader lip
- Remove trees that have fallen on level spreader

“Worst Case” Scenario

- Regrade & Re-sod

No EMC approval
needed for
Maintenance

BAE Stormwater Engineering Group

Filter Strip Maintenance

Typical maintenance
activities (associated
with lawns) may not
always work in Filter
Strips

BAE Stormwater Engineering Group

“We Bring Engineering to Life”

Mowing

BAE Stormwater Engineering Group

- Don't Mow after rain/ soggy conditions
- Be careful with lowering mower – scarring
- Probably best to move parallel to level spreader (on grade)
 - Might be wishful thinking

Avoid Scalping Grass

BAE Stormwater Engineering Group

Table 2. Guidelines for Mowing Heights

| Lawngrass | Height after Mowing (inches) |
|--|------------------------------|
| Bermudagrass | 3/4 to 1 1/2 |
| Zoysiagrass | 3/4 to 1 1/2 |
| Centipedegrass | 1 to 1 1/2 |
| Kentucky bluegrass, fine fescue, or perennial ryegrass | 1 1/2 to 2 1/2 |
| Tall fescue | 2 1/2 to 3 1/2 |

Fertilizer + Pets

- Consider “No Fertilizing” Signs as requirement
- Filter Strip could be an attractive spot for dogs

A Bit More on Fertilizer

- A one-time initial, slow-release fertilization is OK
- Couple this with a soil test
- May need to lime for pH, too
- After that, let N+P in runoff do the work

By the way... a "no-no"

BAE Stormwater Engineering Group

"We Bring Engineering to Life"

NC STATE UNIVERSITY

Riparian Buffers V. Vegetated Filter Strips

- Vegetated Filter Strips are grassed "designed" systems
 - Graded evenly
 - Typically grassed filled
 - Can be various widths
- Maintenance/working in the VFS is allowable

BAE Stormwater Engineering Group

Grassed Filter Strip Maintenance

- Mowing
 - And, therefore, inspection every time mowed
- “Overhaul” maintenance: if channelization in VFS
 - Re-grade and sod

BAE Stormwater Engineering Group

“We Bring Engineering to Life”

NC STATE UNIVERSITY

Grass Health in Bypass?

Summary of Activities

| Action | Frequency |
|---|------------------------------------|
| Remove Sediment and Debris from Forebay and From Behind Lip (From Diversion if Present) | Twice per Year |
| Remove Large Stemmed Vegetation From Level Spreader | Once per Year |
| Remove Trees that have fallen on Level Spreader | As Needed |
| Inspect and Repair Level Spreader | Inspect Monthly – Repair as Needed |
| Inspect and Repair Riparian Buffer/ VFS and Bypass Channel | Inspect Monthly – Repair as Needed |
| Mowing VFS & Other | As Needed |

Questions ?

BAE Stormwater Engineering Group

"We Bring Engineering to Life"

Sand Filter & Proprietary Filters

Why A Sand Filter?

- Commonly used in 'ultra' urban environments –expensive land, built-out watersheds
- Can drive on some of them
- Very effective at filtering TSS and oil and grease

Sand filter limitations

- Expensive to build and maintain
- Easily clogged

How Sand Filters Work:

Don't Let Smutzdecke ruin the infiltration rate

- Break up crusty layer on top of Sand once per year, on average
- Garden Rake works

Disposal Options

- Take to Landfill
 - Sedimentation Chamber + Top of Sand Chamber
- Research may mandate other options in future

NC STATE UNIVERSITY

Stormwater

12/04/2007

12/04/2007

for BMP Maintenance & Inspection

Sand Filter Maintenance Tasks and Schedule

| •TASK | •SCHEDULE |
|---|--|
| Street sweep parking lot | •Quarterly |
| Clean trash | •As needed |
| •Skim/ Break up sand media | •Annual |
| •Pump oil & grit from sedimentation chamber | •Annual to tri-annual |
| Replace sand media | •When clogged – expect 3 years or when sedimentation chamber cleaned |

Proprietary Devices

- Examples:
 - BaySaver
 - CDS Technologies
 - Stormceptor
 - Stormfilter
 - Vortechs
 - And many more

Why A Proprietary Device?

- Usually sited in urban environments where there is no room for a biological BMP
- Almost all are located underground – can drive or build over them

Can Be Simple....like Special Inlet Devices

Trash Guard™

Proprietary Devices

NC STATE UNIVERSITY

Parking Lot BMP?

Lock Lid for Safety

Task Committee: ASCE

- In 2008, NC State hosted a Manufactured Practice Maintenance Task Force
- Group included Academia, Consulting, Government, and Vendors
- The Group ****by consensus**** agreed to certain maintenance elements.

How Proprietary Devices Work:

- By way of filtration, settling, and other separation techniques:
 - Separate oil and grease
 - Retain grit and trash
 - Remove suspended solids and associated pollutants
 - Every system is unique

Some Common Agreed Upon Elements of Maintenance...

 - Replacing filters

Grassy Swales

Why A Grassy Swale?

- An alternative to curb and gutter
- An alternative to a steep sided, eroding ditch or rip-rap
- Runoff must be transported
- Inexpensive to construct relative to curb and gutter, rip rap, and pipes
- Easy to maintain
- Receive pollutant removal credit

Coir Fiber Matting

Coir fiber matting also called an erosion control fabric are woven matting with different mesh size, to perform different functions like filtration, separation, drainage, reinforcement and erosion control. They have high tensile strength, water absorption capabilities (can hold up to 3 times of its own weight) and arrest run-off top soil. It is biodegradable and complete degradation in 3 to 5 years. Its unique properties include right strength, durability to prevent slopes against erosion and helps natural vegetation to take root.

A higher density means a tighter mesh and less open area in the netting. The lighter grades of coir fiber matting are suitable for prompt erosion control of all kinds of green areas. The netting can also be used at places like garbage dumps and mining areas, where land changes shape frequently.

The heavier grades can be used on embankments and slopes where there is little or no vegetation. Other advantageous applications are on ski slopes, and as a bottom reinforcing material in watercourses. Coir has good properties for use underwater. There the natural degradation is considerably slower, since microorganisms are generally less active.

Target pH for Plant Growth

Table 1. Target pH for a variety of North Carolina plants when produced on mineral soils*.

| Plant group | Target pH | Species |
|----------------|-----------|--|
| Field crops | 6.0 | Corn, millet, small grains, sorghum, soybeans, tobacco |
| | 6.2 | Cotton |
| Vegetables | 6.0 | Beans, cucurbits, cole crops, potato, spinach, sweetpotato |
| | 6.5 | Asparagus, tomato |
| Small fruits | 4.5 | Blueberry |
| | 6.0 | Blackberry, grape, strawberry |
| Forage grasses | 6.0 | Fescue, orchardgrass, and timothy (maintenance); bahiagrass; bluegrass; sudangrass |
| | 6.5 | Fescue, orchardgrass, and timothy (establishment); bermuda |
| Forage legumes | 6.0 | Crimson and white clover, lespedeza |
| | 6.5 | Alfalfa, ladino, and red clover |
| Lawns/gardens | 5.0 | Azalea, camellia, mountain laurel, rhododendron |
| | 5.5 | Centipede grass |
| | 6.0 | Other lawn grasses, flower garden, shrubbery, shade trees |
| | 6.5 | Rose, vegetable garden |
| Nursery | 5.0 | Ginseng, native ornamentals, rhododendron |
| | 6.0 | Most other flowers |
| | 6.5 | Gypsophila |
| Trees/Orchards | 5.5 | Fir and Northern spruce Christmas trees, pine |
| | 6.0 | Apple (maintenance), pecan, hardwoods |

Lower pH – Alkaline soils

Table 1.
Pounds of Sulfur Needed to Lower Soil pH 1

| Material | pH Change | Pounds per 100 square feet 2 |
|--------------|------------|------------------------------|
| Sulfur | 7.5 to 6.5 | 1.5 |
| | 8.0 to 6.5 | 3.5 |
| | 8.5 to 6.5 | 4.0 |
| Iron sulfate | 7.5 to 6.5 | 12.5 |
| | 8.0 to 6.5 | 29.0 |
| | 8.5 to 6.5 | 33.2 |

1 Effective only on soils without free lime, do the vinegar test!
2 Higher rates will be required on fine-textured clayey soils and soils with a pH of 7.3 and above

Check Dams

- Swales with check dams slow flow of water
- Located at NC art museum
- Rocks added as natural visual element but serve as check dams to slow water flow and aid infiltration

| Zoysiagrass | Low - moderate | High | Moderate-high | Moderate | High | Warm-season | Sprigs, sod |

'Spreaders vs. 'Clumpers'

- "Clumpers"
- Natural growth habit may encourage concentration of flow
- Some very common grasses are "clumpers"
- "Spreaders"
- Natural growth habit encourages diffuse flow
- Some very common grasses are "spreaders"
- But, "spreaders" can be invasive by nature

Tall Fescue -Classic clumper

- Endophyte issues may affect wildlife?
- Non-native, marginally invasive
- Limited shade tolerance

Use heavy seeding rates to avoid clumps - 6 lbs/seed/1000 sq. ft.

Weeping love grass

- Ornamental grass but very 'clumpy'
- Tolerant of light shade

Spreaders

- Bermuda
- Many forms, from common to many hybrids
- Very persistent and hardy,
- Invasive warm season

Crabgrass????

- Pervasive
- It comes up anyway
- Why not seed it and encourage crabgrass and goose grass?
- 'Red River Crabgrass' is one brand

English Ivy Swale

Turfgrass and Trees

- We also like to grow grass under tree canopies
- Very common condition in residential yards, some swales, and in VFS
- Grass does not compete well against trees
- Issues with root competition and shading

Grass/Tree Competition

Mowing regimens?

Avoid scalping grass

- There is a direct relationship between the height of the shoots and the depth of the roots
- Tall grass encourages infiltration, filtration, transpiration

Table 2. Guidelines for Mowing Heights

| Lawngrass | Height after Mowing (inches) |
|--|------------------------------|
| Bermudagrass | 3/4 to 1 1/2 |
| Zoysiagrass | 3/4 to 1 1/2 |
| Centipedegrass | 1 to 1 1/2 |
| Kentucky bluegrass, fine fescue, or perennial ryegrass | 1 1/2 to 2 1/2 |
| Tall fescue | 2 1/2 to 3 1/2 |

More mowing heights

| Mowing Height Adaptation | Drought Tolerance |
|--|--|
| <p>High cut</p> <p>↑</p> <p>Tall fescue</p> <p>Red fescue</p> <p>Kentucky bluegrass</p> <p>Perennial ryegrass</p> <p>St. Augustinegrass</p> <p>Common bermudagrass</p> <p>Zoysiagrass</p> <p>Dichondra</p> <p>Kikuyugrass</p> <p>Colonial bentgrass</p> <p>Highland bentgrass</p> <p>Hybrid bermudagrass</p> <p>Creeping bentgrass</p> <p>↓</p> <p>Low cut</p> | <p>High</p> <p>↑</p> <p>Hybrid bermudagrass</p> <p>Zoysiagrass</p> <p>Common bermudagrass</p> <p>St. Augustinegrass</p> <p>Kikuyugrass</p> <p>Tall fescue</p> <p>Red fescue</p> <p>Kentucky bluegrass</p> <p>Perennial ryegrass</p> <p>Highland bentgrass</p> <p>Creeping bentgrass</p> <p>Colonial bentgrass</p> <p>Dichondra</p> <p>↓</p> <p>Low</p> |

The man with the mower...

- Perhaps the lowest paid crew member? But...
- 'Walks' the swale every time he mows
- Should be trained to recognize early signs of problems such as:
- Erosion, ruts, dead grass, poor growth, invasive weeds

Compaction

- Compacted soils shed water and encourage concentration of flow
- Compacted soils discourage plant growth and root penetration

Aerification: core aerator

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Drought Stress

- Compaction?
- Poor soil fertility?

Water delivery to swale

Inspection and Maintenance Checklist for a Vegetated Swale

Property Address: _____ Date of Inspection: _____ Type of Inspection: ☐ Monthly ☐ Pre-Wet Season ☐ End of Wet Season
 Treatment Measure No.: _____
 Inspector(s): _____

| Defect | Conditions when Maintenance is Needed | Maintenance Needed? (Y/N) | Comments* | Results Expected when Maintenance is Performed |
|--------------------------------------|--|---------------------------|-----------|---|
| 1. Sediment accumulation | Sediment depth exceeds 2 inches or covers vegetation | | | Sediment deposits should be removed without significant disturbance of the vegetation. When finished, swale should be level from side to side and drain freely toward outlet. There should be no areas of standing water after inflow has ceased. |
| 2. Trash and debris accumulation | Any trash and debris that exceeds 5 cubic feet per 1,000 square feet (one standard garbage can) | | | Trash and debris are removed from the swale. |
| 3. Standing water | When water stands in the swale between storms and does not drain freely | | | There should be no areas of standing water after inflow has ceased. Outlet structures and underdrain (if installed) should drain freely. |
| 4. Flow spreader | Flow spreader uneven or clogged so that flows are not uniformly distributed through entire swale width | | | Spreader leveled and cleaned such that flows are distributed evenly over the entire swale width. |
| 5. Excessive shading | Vegetation growth is poor because sunlight does not reach swale | | | Overhanging limbs and brushy vegetation on side slopes are trimmed back. |
| 6. Erosion/scouring | Eroded or scoured swale bottom due to flow channelization or higher flows | | | No erosion or scouring in swale bottom. For ruts or bare areas less than 12 inches wide, damaged areas repaired by filling with crushed gravel. Over time the grass will have started to cover the rock. |
| 7. Visual contaminants and pollution | Any visual evidence of oil, gasoline, contaminants, or other pollutants | | | No visual evidence of contaminants or pollutants present. |
| 8. Vegetation length | When the grass becomes excessively tall (greater than 10 inches); when nuisance weeds and other vegetation starts to take over | | | Vegetation trimmed or mowed, and nuisance vegetation removed so that flow is not impeded. Vegetation/grass should not be trimmed shorter than 4 to 6 inches (depending on landscape requirements). Grass clippings removed. |
| 9. Inlet/outlet blockage | Inlet/outlet areas clogged with sediment or debris | | | Inlet/outlet is clear of material and allows water to flow freely |

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

| Defect | Conditions when Maintenance is Needed | Maintenance Needed? (Y/N) | Comments ^a | Results Expected when Maintenance is Performed |
|-------------------------------|--|---------------------------|-----------------------|--|
| 10. Low-flow channel overflow | Nuisance flows are ponding, swale is continually wet | | | Low-flow channel media is renewed to adequately convey nuisance flows. |
| 11. Constant baseflow | When small quantities of water continually flow through the swale, even when it has been dry for weeks, and an eroded muddy channel has formed in the swale bottom | | | A low-flow pea gravel drain can be added to the length of the swale, or an underdrain can be installed, to prevent an eroded or muddy channel. |
| 12. Poor vegetation coverage | When grass is sparse or bare or eroded patches occur in more than 10% of the swale bottom | | | Vegetation coverage is in more than 90% of the swale bottom. Poorly vegetated areas of the swale bottom should be re-planted with plugs of grass from the upper slope and reseeded in locations where plugs were taken. Plugs should be planted in the swale bottom with no gaps, or reseeded into loosened, fertile soil. |

^a Describe the maintenance completed; if the needed maintenance was not conducted, note when it will be done.

Green Roofs

Why A Green Roof?

- Reduce urban heat island effect
- Improve urban air quality
- Prolong roof life and add insulation
- Add green feature to roof top or urban environment – create living space
- Reduce volume of stormwater runoff
- Help improve urban biodiversity
- Soundproofing

How Green Roofs Work:

- Rain water is stored in the media and drainage layers on the green roof.
- Water is used by plants (transpiration) and can evaporate from media (evapotranspiration or ET)
- Plants and soil cool the air via ET and absorption – urban heat island effect
- Media protects roof and insulates roof

Extensive vs. Intensive

- Green roofs are divided into two categories:
- 1) extensive green roofs, which are 6 inches or shallower and are frequently designed to satisfy specific engineering and performance goals, and
- 2) intensive green roofs, which may become quite deep and merge into more familiar on-structure plaza landscapes with promenades, lawn, large perennial plants, and trees.

Green Roof Requirements

- Load capacity of building
- Slope issues – flat is best, or $< 12^\circ$
- Drainage – well drained but maintain soil moisture
- Materials access during construction
- Access for maintenance

Though the existence of the Babylon gardens cannot be proved, Alexander the Great is said to have gazed upon them in 323 B.C. from his deathbed at King Nebuchadnezzar II's palace. The king, legend has it, built them c. 560 B.C. for his greenery-starved wife.

Green Roofs: Southern Style

Green Walls?

The Federal Reserve Bank of Richmond – Charlotte Branch

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

60,000 sq. ft. Green Roof

Green Roof Justification

- Needed roof replacement
- Most cost effective option
- \$1.5 million project
- 10 year pay-back

Cross-Section of Green Roof

Vegetation
Substrate Soil
Filter/ Separator
Drainage Element
Root Barrier
Vapor Barrier

Existing Roof Top

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Green Roof Soil Loss

- Wind erosion
- Organic matter oxidation

Green Roof Fertilization

- Green Roofs need some fertilization to survive
- 1 oz 10-10-10 slow release fertilizer per sq. yard per year (Ed Snodgrass)
- Overfertilization
 - Creates water pollution from nutrient runoff
 - Encourage excessive weed growth

Green roof runoff quality?

Send GR water to another BMP

Green Roof Weeds

- Can penetrate waterproof membrane – trees and other aggressive weeds
- Can dry out and create a fire hazard
- Can shade out green roof plants
- Can be unsightly
- Can create debris to clog downspouts
- Should be pulled or herbicide wiped as soon as noticed

Green Roof Plants

- Low growth height
Rapid growth / spreading
- High drought tolerance
Fibrous root as opposed to tap roots to protect roofing membranes
- No special irrigation or nutritional requirements
- Low maintenance - trimming, weeding, feeding
- Plants shouldn't generate airborne seeds in order to prevent the green roof plants invading other landscaping

Plant Die-off

Green Roof Issues

- Watch gutters and scuppers – green roofs generate more debris than regular roofs
- Confine visitors to walkways
- Remind visitors of no smoking, potential for high winds, and to be careful near edges – it is still a roof

July 20, 2009

SOOKIE
Green roofs are expected to proliferate with a Toronto bylaw mandating them for new buildings.

Insurance

Concerns raised over fire safety for green roofs

PETER KENTER
correspondent

California brush fires frequently make the news as they destroy homes and businesses.

However, what happens if a brush fire occurs on top of a downtown highrise?

"I don't believe that the insurance industry has caught up with the increased risk of fire that may result from

Green Roof Maintenance Tasks and Schedule

| •TASK | •SCHEDULE |
|---|---------------------------------|
| Regular cleaning – debris removal - down spout check | •Monthly |
| Watering? | •As needed, summer and droughts |
| •Fertilization? Via compost or fertilizer | •Annual |
| •Plant replacement | •Annual |
| •Weeding (trees and volunteers | •Quarterly |
| •Soil replacement | •Annual |

Where is the cistern???

Why A Cistern

- Cisterns store rain water
- Rain water can be used for any non-potable use such as irrigation, vehicle washing, toilet flushing
- Saves potable water
- Stored water does not contribute to runoff
 - Reduces stormwater 'footprint'

How Cisterns Work:

- 1000 sq ft roof catching 1 inch of rain produces 650 gallons of water
- First flush diverter diverts pollen/leaves, etc. so clean water enters cistern
- Cistern is sized to match roof size and intended use
- A pump is needed for pressure
- May need protection from freezing

Water Harvesting Layout

Terminolgy

- Detention
- Single-Purpose
- Dual-Purpose

Detention

- Reduces peak stormwater runoff by storing rainwater from the roof and other hard surfaces (parking lots, etc.) and slowly releases the rainwater through a small diameter orifice
- Two outlets: small orifice for drawdown (10-35 mm) at bottom of tank and large overflow pipe connected to storm drain

Single-Purpose

- Provides a non-potable water supply.
- Collects water from rooftops only and is used for household use.
- Parking lot water is too polluted for household use
- Small outlet at bottom for plumbing connection and large overflow pipe at top for bypass of large flows

Dual Purpose

- Provide non-potable water supply and reduce peak flows.
- Collects water from roof only.
- Two small outlets, one overflow outlet
- One small outlet midway down side of tank to slowing release detention water
- One small outlet at bottom to feed pump for household non-potable uses

Who owns Colorado's rainwater?

Environmentalists and others like to gather it in containers for use in drier times. But state law says it belongs to those who bought the rights to waterways.

By Nicholas Riccardi
March 18, 2009

Reporting from Denver -- Every time it rains here, Kris Holstrom knowingly breaks the law.

Holstrom's violation is the fancifully painted 55-gallon buckets underneath the gutters of her farmhouse on a mesa 15 miles from the resort town of Telluride. The barrels catch rain and snowmelt, which Holstrom uses to irrigate the small vegetable garden she and her husband maintain.

» L.A. water rates revised to penalize heavy users

» Lawmakers seek billions to expand, ...

Algae & Cisterns

- Clear or Translucent Cisterns Could Spawn Algae Growth
 - Algae Need Sunlight
- SOLUTION: If Outside, use Black or Green Cistern

"We Bring Engineering
to Life"
NC STATE UNIVERSITY

Stormwater BM

'Stinky' Cistern Water

- A rotten egg odor or sulphur odor in water can be from dissolved hydrogen sulfide gas or certain bacteria in your water
- A sulfurous smell or rotten egg smell may also be due to the combination of loss of oxygen in water (hypoxia), or low oxygen levels, combined with algae which feeds and then dies

Shock Chlorination

- Use 32 fluid oz unscented chlorine bleach (5.25% chlorine) per 1000 gallons of water (=10 ppm chlorine)
- Can go as high as 50 ppm
- Contact time 24 hours
- Maintenance Chlorination (2-5 ppm) = 6.5 oz bleach per 1000 gallons

Cistern Disinfection

| Material | % Chlorine in material | Amount to add per 1000 gal. to produce 50 ppm chlorine | Amount to add per 1000 gal. to produce 5 ppm chlorine |
|---|------------------------|--|---|
| Sodium Hypochlorite (liquid laundry bleaches such as Clorox or Purex) | 5.25 | 1 gallon | 1 ½ cups |
| Sodium Hypochlorite Commercial Strength | 12 | 7 cups | ¾ cup |
| Chlorinated Lime (powder) | 25 | 3½ cups | 5 tablespoons |
| Calcium Hypochlorite (B.K. Powder) | 50 | 1½ cups | 2½ tablespoons |
| Calcium Hypochlorite (H.T.H., Perchloron, etc.) | 70 | 1 ⅙ cups | 2 tablespoons |

Note: 16 Tablespoons = 1 cup and 256 tablespoons = 1 gallon.
For materials not listed above, the percent of available chlorine will be found on the label under "active ingredients."

Mosquitoes & Cisterns

- Popular Fear: Mosquitoes Breed in Cisterns

Manufacturers have developed well plumbed devices. Screens keep mosquitoes out

Mosquitoes and Safety

- Cover tops and ports to prevent mosquito breeding or access by children
- Secure rain barrels to avoid tipping over

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Cistern "Pieces"

Cistern plumbing

- Keep an eye open for 'creative' plumbing
- Pumps required for water pressure
- May have disconnected inflow pipe from potable system to maintain water level during dry times

Pumps

We use Leader Pumps Divertron 1000 120v
- gives 25gpm @ 25psi

- Have pumps professionally inspected every 2-3 years
- Submersibles are good
- Clean intakes or use floating intakes
- Bury tank 1-2 feet if freezing is an issue

Floating intake – avoids 'gunk' on top & bottom of tank

Floating intake

Inflow pipes

- Can have inflow from roof or other water source for back-up
- Probably activated by float valves
- Must be disconnected – no cross connections to potable water!

Screen Overflow Outlets

- Must be kept clean or water can back up into downspouts and gutters
- Screen to prevent rodent and insect access

Keep Overflow Outlets Clear

- Clogged outlets can mean overflowing cistern – can undermine cistern base

Gutters

Is water getting to the system?

Gutters....

- Consider gutter guards
- If gutters must be cleaned plug downspout opening to prevent debris flow to cistern
- Blow-out gutters rather than wash-out

Why is my cistern water brown? Tannic Acid....

Check Inlet Screens

- Keep gutter debris out
- Keep rodents and reptiles out of cistern

What is that yellow stuff floating
in my cistern?

NC STATE UNIVERSITY

Stormwater BMP Maintenance

First Flush Screen Must Be Cleaned

Sediment

- Clean sediment if > 8 inches
- Measure sediment with ruler
- May require professional cleaner – vac-truck, confined space
- Consider quality of sediment – directly related to roof covering

If Used for Back-up Water Supply

- Monitor float valves – prone to leak and jam with debris
- The next water bill will tell you if valve is leaking.....
- Check backflow valve on water line

Float Valves

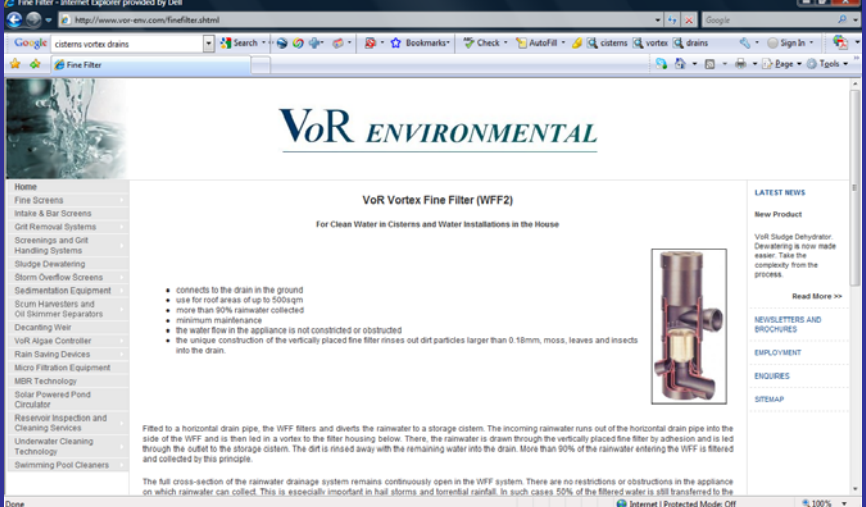

- Water enters tank from cistern
- When tank runs dry, well back-up activates

Filters

- Change filter cartridges as needed

Vortex Filters

VoR ENVIRONMENTAL

VoR Vortex Fine Filter (WFF2)
For Clean Water in Cisterns and Water Installations in the House

- connects to the drain in the ground
- use for roof areas of up to 500sqm
- more than 90% rainwater collected
- minimum maintenance
- the water flow in the appliance is not constricted or obstructed
- the unique construction of the vertically placed fine filter rinses out dirt particles larger than 0.18mm, moss, leaves and insects into the drain.

Fitted to a horizontal drain pipe, the WFF filters and diverts the rainwater to a storage cistern. The incoming rainwater runs out of the horizontal drain pipe into the side of the WFF and is then led in a vortex to the filter housing below. There, the rainwater is drawn through the vertically placed fine filter by adhesion and is led through the outlet to the storage cistern. The dirt is rinsed away with the remaining water into the drain. More than 90% of the rainwater entering the WFF is filtered and collected by this principle.

The full cross-section of the rainwater drainage system remains continuously open in the WFF system. There are no restrictions or obstructions in the appliance on which rainwater can collect. This is especially important in hail storms and torrential rainfall. In such cases 50% of the filtered water is still transferred to the

URBAN Waterways

Water Quality of Rooftop Runoff: *Implications for Residential Water Harvesting Systems*

The presence of various pollutants in rooftop runoff establishes a need for some general guidelines, discussed in this publication, regarding the use of collected rainwater in North Carolina.

Much of the southeastern United States, including North Carolina, experienced

dust and particulate matter from vehicle exhaust and the burning of fossil fuels

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Trim or Clear Overhanging Branches

- Lowers debris loading of roof and gutters
- Eliminates roosting points for birds
- Eliminates access points for rodents (rats and squirrels)

NC STATE UNIVERSITY

Stormwater BMP Maintenance & Inspection

Check Hatches and Covers

- Check fit and seal to prevent child and insect access

NC STATE UNIVERSITY

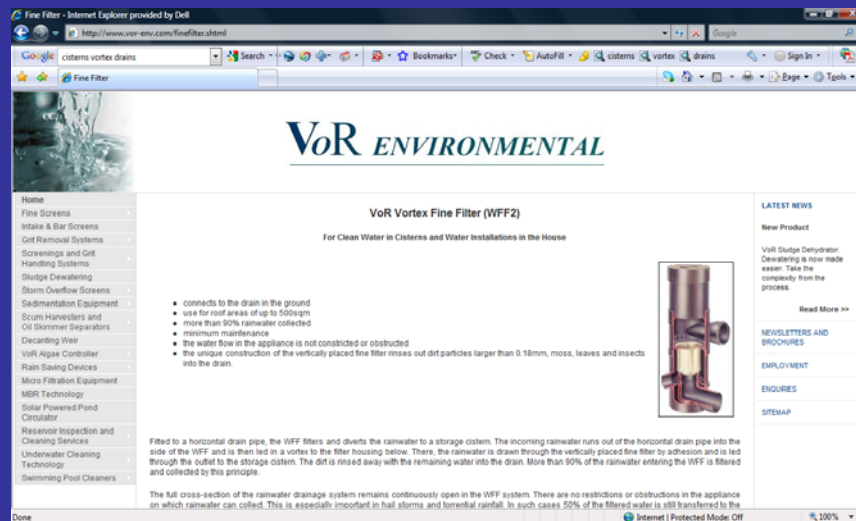

Stormwater BMP Maintenance & Inspection

'Gunk' Collection in Bottom of Cistern

- Look for cisterns with vortex drain valves that 'self clean' the bottom of the cistern.

Vortex Filters

Inspection and Maintenance Checklist for a Cistern

Property Address: _____ Property Owner: _____
 Treatment Measure No.: _____ Date of Inspection: _____ Type of Inspection: ☐ Monthly ☐ Pre-Wet Season ☐ End of Wet Season
☐ After heavy runoff ☐ Other: _____
 Inspector(s): _____

| Defect | Conditions when Maintenance is Needed | Maintenance Needed? (Y/N) | Comments ^a | Results Expected when Maintenance is Performed |
|---|--|---------------------------|-----------------------|--|
| 1. Low flow | Gutters are full of debris and overflowing | | | When gutters are cleaned appropriately and gutter guards or screens are installed, gutters should be clear and free-flowing. |
| 2. Inlet | Filters are clogged or full | | | Filters are clean and free of trash and debris. |
| 3. First flush diverter | First flush filter is full or clogged causing permanent flow to the cistern | | | When first flush diverter valve is removed and cleaned, the first flush will be diverted away from the cistern. |
| 4. Cistern does not drain within 48 hours | Outlet is clogged | | | Cistern completely drains within 48 hours. |
| 5. Cistern drains in less than 24 hours | Cistern leaks or outlet allows excessive flows | | | Cistern drains in 24 to 48 hours. |
| 6. Miscellaneous | Any condition not covered above that needs attention for the infiltration trench to function as designed | | | Meet the design specifications. |

^a Describe the maintenance completed; if the needed maintenance was not conducted, note when it will be done.

FINAL DRAFT
