# SD CLIMATE ACTION PLAN CONSISTENCY CHECKLIST INTRODUCTION

In December 2015, the City adopted a Climate Action Plan (CAP) that outlines the actions that City will undertake to achieve its proportional share of State greenhouse gas (GHG) emission reductions. The purpose of the Climate Action Plan Consistency Checklist (Checklist) is to, in conjunction with the CAP, provide a streamlined review process for proposed new development projects that are subject to discretionary review and trigger environmental review pursuant to the California Environmental Quality Act (CEQA).<sup>1</sup>

Analysis of GHG emissions and potential climate change impacts from new development is required under CEQA. The CAP is a plan for the reduction of GHG emissions in accordance with CEQA Guidelines Section 15183.5. Pursuant to CEQA Guidelines Sections 15064(h)(3), 15130(d), and 15183(b), a project's incremental contribution to a cumulative GHG emissions effect may be determined not to be cumulatively considerable if it complies with the requirements of the CAP.

This Checklist is part of the CAP and contains measures that are required to be implemented on a project-by-project basis to ensure that the specified emissions targets identified in the CAP are achieved. Implementation of these measures would ensure that new development is consistent with the CAP's assumptions for relevant CAP strategies toward achieving the identified GHG reduction targets. Projects that are consistent with the CAP as determined through the use of this Checklist may rely on the CAP for the cumulative impacts analysis of GHG emissions. Projects that are not consistent with the CAP must prepare a comprehensive project-specific analysis of GHG emissions, including quantification of existing and projected GHG emissions and incorporation of the measures in this Checklist to the extent feasible. Cumulative GHG impacts would be significant for any project that is not consistent with the CAP.

The Checklist may be updated to incorporate new GHG reduction techniques or to comply with later amendments to the CAP or local, State, or federal law.

<sup>&</sup>lt;sup>1</sup> Certain projects seeking ministerial approval may be required to complete the Checklist. For example, projects in a Community Plan Implementation Overlay Zone may be required to use the Checklist to qualify for ministerial level review. See Supplemental Development Regulations in the project's community plan to determine applicability.

This page intentionally left blank

# SUBMITTAL APPLICATION

- The Checklist is required only for projects subject to CEQA review.<sup>2</sup>
- If required, the Checklist must be included in the project submittal package. Application submittal procedures can be found in <u>Chapter 11: Land Development Procedures</u> of the City's Municipal Code.
- The requirements in the Checklist will be included in the project's conditions of approval.
- The applicant must provide an explanation of how the proposed project will implement the requirements described herein to the satisfaction of the Planning Department.

| Industrial (total square footage):   |                              |                                |
| <ul> <li>Other (describe):</li> <li>3. Is the project or a portion of the project located in a<br/>Transit Priority Area?</li> </ul> | □ Yes □ No                   |                                |

4. Provide a brief description of the project proposed:

<sup>&</sup>lt;sup>2</sup> Certain projects seeking ministerial approval may be required to complete the Checklist. For example, projects in a Community Plan Implementation Overlay Zone may be required to use the Checklist to qualify for ministerial level review. See Supplemental Development Regulations in the project's community plan to determine applicability.

# Step 1: Land Use Consistency

The first step in determining CAP consistency for discretionary development projects is to assess the project's consistency with the growth projections used in the development of the CAP. This section allows the City to determine a project's consistency with the land use assumptions used in the CAP.

| Step 1: Land Use Consistency   |  |     |    |
|--|--|-----|----|
| Checklist Item<br>(Check the appropriate box   | and provide explanation and supporting documentation for your answer)  | Yes | No |
| <ul> <li>zoning designations?;<sup>3</sup></li> <li>B. If the proposed project includes a land use pla result in an increased actions, as determined</li> <li>C. If the proposed project the project include a la</li> </ul> | consistent with the existing General Plan and Community Plan land use and <u>OR</u> ,<br>is not consistent with the existing land use plan and zoning designations, and<br>n and/or zoning designation amendment, would the proposed amendment<br>density within a Transit Priority Area (TPA) <sup>4</sup> and implement CAP Strategy 3<br>in Step 3 to the satisfaction of the Development Services Department?; <u>OR</u> ,<br>is not consistent with the existing land use plan and zoning designations, does<br>nd use plan and/or zoning designation amendment that would result in an<br>-intensive project when compared to the existing designations? |     |    |

If "**Yes**," proceed to Step 2 of the Checklist. For question B above, complete Step 3. For question C above, provide estimated project emissions under both existing and proposed designation(s) for comparison. Compare the maximum buildout of the existing designation and the maximum buildout of the proposed designation.

If "**No**," in accordance with the City's Significance Determination Thresholds, the project's GHG impact is significant. The project must nonetheless incorporate each of the measures identified in Step 2 to mitigate cumulative GHG emissions impacts unless the decision maker finds that a measure is infeasible in accordance with CEQA Guidelines Section 15091. Proceed and complete Step 2 of the Checklist.

<sup>&</sup>lt;sup>3</sup> This question may also be answered in the affirmative if the project is consistent with SANDAG Series 12 growth projections, which were used to determine the CAP projections, as determined by the Planning Department.

<sup>&</sup>lt;sup>4</sup> This category applies to all projects that answered in the affirmative to question 3 on the previous page: Is the project or a portion of the project located in a transit priority area.

# Step 2: CAP Strategies Consistency

The second step of the CAP consistency review is to review and evaluate a project's consistency with the applicable strategies and actions of the CAP. Step 2 only applies to development projects that involve permits that would require a certificate of occupancy from the Building Official or projects comprised of one and two family dwellings or townhouses as defined in the California Residential Code and their accessory structures.<sup>5</sup> All other development projects that would not require a certificate of occupancy from the Building Official shall implement Best Management Practices for construction activities as set forth in the <u>Greenbook</u> (for public projects).

| Step 2: CAP Strategies Consistency  | y   |    |     |
|---|-----|----|-----|
| Checklist Item<br>(Check the appropriate box and provide explanation for your answer)   | Yes | No | N/A |
| Strategy 1: Energy & Water Efficient Buildings  |     |    |     |
| 1. Cool/Green Roofs.  |     |    |     |
| <ul> <li>Would the project include roofing materials with a minimum 3-year aged solar reflection and thermal emittance or solar reflection index equal to or greater than the values specified in the voluntary measures under <u>California Green Building Standards Code</u> (Attachment A)?; <u>OR</u></li> <li>Would the project roof construction have a thermal mass over the roof</li> </ul> |     |    |     |
| membrane, including areas of vegetated (green) roofs, weighing at least 25 pounds per square foot as specified in the voluntary measures under <u>California</u> <u>Green Building Standards Code</u> ?; <u>OR</u>  |     |    |     |
| <ul> <li>Would the project include a combination of the above two options?</li> </ul>   |     |    |     |
| Check "N/A" only if the project does not include a roof component.  |     |    |     |

<sup>&</sup>lt;sup>5</sup> Actions that are not subject to Step 2 would include, for example: 1) discretionary map actions that do not propose specific development, 2) permits allowing wireless communication facilities, 3) special events permits, 4) use permits or other permits that do not result in the expansion or enlargement of a building (e.g., decks, garages, etc.), and 5) non-building infrastructure projects such as roads and pipelines. Because such actions would not result in new occupancy buildings from which GHG emissions reductions could be achieved, the items contained in Step 2 would not be applicable.

| . Plumbing fixtures and fittings   |  |  |
|--|--|--|
| With respect to plumbing fixtures or fittings provided as part of the project, would those low-flow fixtures/appliances be consistent with each of the following:  |  |  |
| Residential buildings:   |  |  |
| <ul> <li>Kitchen faucets: maximum flow rate not to exceed 1.5 gallons per minute at 60 psi;</li> </ul>   |  |  |
| <ul> <li>Standard dishwashers: 4.25 gallons per cycle;</li> </ul>  |  |  |
| <ul> <li>Compact dishwashers: 3.5 gallons per cycle; and</li> <li>Clothes washers: water factor of 6 gallons per cubic feet of drum capacity?</li> </ul>   |  |  |
| Nonresidential buildings:  |  |  |
| <ul> <li>Plumbing fixtures and fittings that do not exceed the maximum flow rate<br/>specified in <u>Table A5.303.2.3.1 (voluntary measures) of the California Green</u><br/><u>Building Standards Code</u> (See Attachment A); and</li> </ul> |  |  |
| • Appliances and fixtures for commercial applications that meet the provisions of <u>Section A5.303.3 (voluntary measures) of the California Green Building Standards</u><br>Code (See Attachment A)?  |  |  |
| Check "N/A" only if the project does not include any plumbing fixtures or fittings.  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |

| Strategy 3: Bicycling, Walking, Transit & Land Use   |  |  |
|--|--|--|
| 3. Electric Vehicle Charging   |  |  |
| <ul> <li><u>Multiple-family projects of 17 dwelling units or less</u>: Would 3% of the total parking spaces required, or a minimum of one space, whichever is greater, be provided with a listed cabinet, box or enclosure connected to a conduit linking the parking spaces with the electrical service, in a manner approved by the building and safety official, to allow for the future installation of electric vehicle supply equipment to provide electric vehicle charging stations at such time as it is needed for use by residents?</li> <li><u>Multiple-family projects of more than 17 dwelling units</u>: Of the total required listed cabinets, boxes or enclosures, would 50% have the necessary electric vehicle supply equipment installed to provide active electric vehicle charging stations ready for use by residents?</li> <li><u>Non-residential projects</u>: Of the total required listed cabinets, boxes or enclosures, would 50% have the necessary electric vehicle charging stations ready for use by residents?</li> <li><u>Non-residential projects</u>: Of the total required listed cabinets, boxes or enclosures, would 50% have the necessary electric vehicle supply equipment installed to provide active electric vehicle charging stations ready for use?</li> <li><u>Non-residential projects</u>: Of the total required listed cabinets, boxes or enclosures, would 50% have the necessary electric vehicle supply equipment installed to provide active electric vehicle charging stations ready for use?</li> </ul> |  |  |
| Strategy 3: Bicycling, Walking, Transit & Land Use<br>(Complete this section if project includes non-residential or mixed uses)  |  |  |
| 4. Bicycle Parking Spaces Would the project provide more short- and long-term bicycle parking spaces than required in the City's Municipal Code ( <u>Chapter 14, Article 2, Division 5</u> )? <sup>6</sup> Check "N/A" only if the project is a residential project.   |  |  |

<sup>&</sup>lt;sup>6</sup> Non-portable bicycle corrals within 600 feet of project frontage can be counted towards the project's bicycle parking requirements.

| 0-10         0         0           11-50         1 shower stall         2           51-100         1 shower stall         3           101-200         1 shower stall         4           1 shower stall plus 1         1 two-tier locker plus 1 |

#### CAP Checklist Item No. 7 – Supplemental Explanation

Transportation Demand Management Program – The project includes a Transportation Demand Management Program as detailed in the Transportation Impact Analysis by Linscott, Law and Greenspan that includes the following measures:

- Carpool/vanpool parking spaces will be provided in preferentially located areas (closest to building entrances) for use by qualified employees. These spaces will be signed and striped "Car/Vanpool Parking Only". Information about the availability of and the means of accessing the car/vanpool parking spaces will be posted on Transportation Information Displays located in back-offices, common areas or on intranets, as appropriate.
- 2a) The project will maintain an employer network in the SANDAG iCommute program and employees will be offered the opportunity to register for commuter ridematching provided through publicly sponsored services (e.g., SANDAG sponsored "iCommute Ridetracker" or similar program).
- 2b) The project will reduce the demand for trips by participating in the Veterans Affairs Veterans Transportation Program which dedicates Veterans Affairs resources to subsidize carpool, vanpool, and transit travel options.
- 2c) The project is within ¼-mile of numerous services that reduce the need to drive such as (see map in Attachment A):
  - Cafes, restaurants, and dry cleaners available in the Olympus Corsair project which is on the southwest corner of Aero Drive and Sandrock Drive;
  - Cafes, restaurants, and other commercial services such as cleaners and a barber shop in the commercial shopping center on the northwest corner of Aero Drive and Sandrock Drive;
  - A café located to the west in the building immediately adjacent to the project site; and
  - The Serra Mesa-Kearny Mesa Branch library which includes numerous resources such as computer and internet access to the east of the project site on the south side of Aero Drive.

Additionally, the project is 2,135 feet from the social security office and there are two bus stops that are 1,375 feet from each other which further provide access to the social security office while reducing trips.

# Step 3: Project CAP Conformance Evaluation (if applicable)

The third step of the CAP consistency review only applies if Step 1 is answered in the affirmative under option B. The purpose of this step is to determine whether a project that is located in a TPA but that includes a land use plan and/or zoning designation amendment is nevertheless consistent with the assumptions in the CAP because it would implement CAP Strategy 3 actions. In general, a project that would result in a reduction in density inside a TPA would not be consistent with Strategy 3.The following questions must each be answered in the affirmative and fully explained.

1. Would the proposed project implement the General Plan's City of Villages strategy in an identified Transit Priority Area (TPA) that will result in an increase in the capacity for transit-supportive residential and/or employment densities?

Considerations for this question:

- Does the proposed land use and zoning designation associated with the project provide capacity for transit-supportive residential densities within the TPA?
- Is the project site suitable to accommodate mixed-use village development, as defined in the General Plan, within the TPA?
- Does the land use and zoning associated with the project increase the capacity for transit-supportive employment intensities within the TPA?
- 2. Would the proposed project implement the General Plan's Mobility Element in Transit Priority Areas to increase the use of transit? Considerations for this question:
  - Does the proposed project support/incorporate identified transit routes and stops/stations?
  - Does the project include transit priority measures?
- 3. Would the proposed project implement pedestrian improvements in Transit Priority Areas to increase walking opportunities? Considerations for this question:
  - Does the proposed project circulation system provide multiple and direct pedestrian connections and accessibility to local activity centers (such as transit stations, schools, shopping centers, and libraries)?
  - Does the proposed project urban design include features for walkability to promote a transit supportive environment?

#### 4. Would the proposed project implement the City of San Diego's Bicycle Master Plan to increase bicycling opportunities? Considerations for this question:

- Does the proposed project circulation system include bicycle improvements consistent with the Bicycle Master Plan?
- Does the overall project circulation system provide a balanced, multimodal, "complete streets" approach to accommodate mobility needs of all users?

#### 5. Would the proposed project incorporate implementation mechanisms that support Transit Oriented Development? <u>Considerations for this question:</u>

- Does the proposed project include new or expanded urban public spaces such as plazas, pocket parks, or urban greens in the TPA?
- Does the land use and zoning associated with the proposed project increase the potential for jobs within the TPA?
- Do the zoning/implementing regulations associated with the proposed project support the efficient use of parking through mechanisms such as: shared parking, parking districts, unbundled parking, reduced parking, paid or time-limited parking, etc.?

# 6. Would the proposed project implement the Urban Forest Management Plan to increase urban tree canopy coverage?

Considerations for this question:

- Does the proposed project provide at least three different species for the primary, secondary and accent trees in order to accommodate varying parkway widths?
- Does the proposed project include policies or strategies for preserving existing trees?
- Does the proposed project incorporate tree planting that will contribute to the City's 20% urban canopy tree coverage goal?

# SD CLIMATE ACTION PLAN CONSISTENCY CHECKLIST ATTACHMENT A

This attachment provides performance standards for applicable Climate Action Pan (CAP) Consistency Checklist measures.

| Land Use Type                    | Roof Slope | Minimum 3-Year Aged<br>Solar Reflectance | Thermal Emittance | Solar Reflective Index |
|----------------------------------|------------|--|-------------------|------------------------|
| Law Diag Desidential             | ≤2:12      | 0.55                                     | 0.75              | 64                     |
| Low-Rise Residential             | > 2:12     | 0.20                                     | 0.75              | 16                     |
| High-Rise Residential Buildings, | ≤2:12      | 0.55                                     | 0.75              | 64                     |
| Hotels and Motels                | > 2:12     | 0.20                                     | 0.75              | 16                     |
| Nex Desidential                  | ≤2:12      | 0.55                                     | 0.75              | 64                     |
| Non-Residential                  | > 2:12     | 0.20                                     | 0.75              | 16                     |

CALGreen does not include recommended values for low-rise residential buildings with roof slopes of  $\leq$  2:12 for San Diego's climate zones (7 and 10). Therefore, the values for climate zone 15 that covers Imperial County are adapted here.

Solar Reflectance Index (SRI) equal to or greater than the values specified in this table may be used as an alternative to compliance with the aged solar reflectance values and thermal emittance.

| able 2 Fixture Flow Rates for Non-Residential Buildings related to Question 2: Plumbing Fixtures and<br>Fittings supporting Strategy 1: Energy & Water Efficient Buildings of the Climate Action Plan |  |                                       |  |  |

## **1.0 INTRODUCTION AND SCOPE OF SERVICES**

# 1.1 Introduction

Construction Testing and Engineering, Inc. (CTE) has completed a geotechnical investigation and report providing conclusions and recommendations for the proposed hospital annex improvements located at 8875 Aero Drive (APN 421-3000-300), and proposed four-level parking structure to be located on the southern portion of the adjacent parcel at 8825 Aero Drive (APN 421-3000-200) (Figure 1).

The proposed scope of work for the hospital annex includes two wing additions to the existing 100,000 square foot structure and modifications to the proposed building entrance. The wing additions will increase the footprint of the existing structure by approximately 134,000 square feet.

A separate four-story above ground parking structure with associated at-grade parking and drive areas is proposed in the adjacent parcel to the west of the existing building (Figures 1 and 2). Associated improvements are to include flatwork, pavement, and bioretention basins.

CTE has performed this work in general accordance with the terms of proposal G-4337 dated March 16, 2018. Preliminary geotechnical recommendations for excavations, fill placement, and foundation design for the proposed improvements are presented herein.

# 1.2 Scope of Services

The scope of services provided included:

- Review of readily available geologic and soils reports.
- Review of historic topographic maps.
- Coordination of USA and private utility mark-out and location.
- Obtaining appropriate San Diego County Department of Environmental Health (DEH) Boring Permits.
- Excavation of exploratory borings and soil sampling utilizing a truck-mounted drill rig.
- Percolation testing in accordance with County of San Diego Department of Environmental Health (DEH) procedures.
- Establishing infiltration rates in accordance with City of San Diego Storm Water Standards (2018).
- Laboratory testing of selected soil samples.
- Description of the site geology and evaluation of potential geologic hazards.
- Engineering and geologic analysis.
- Preparation of this preliminary geotechnical report.

# **2.0 SITE DESCRIPTION**

The subject site is located at 8875 Aero Drive in San Diego, California (Figure 1). The site is bounded by Aero Drive to the north, commercial structures to the east and west, and residential development to the south. The current site area is illustrated on Figure 1. The proposed improvement area is currently developed with a large commercial structure with associated parking and flatwork, landscaping, utilities and other minor improvements. Based on reconnaissance and review of general site topography, it appears that the improvement area generally descends to the north with elevations ranging from approximately 420 feet above mean sea level in the south (msl) to approximately 413 feet msl to the north. The proposed site modifications and additions are depicted on Figure 2.

#### 3.0 FIELD INVESTIGATION AND LABORATORY TESTING

#### 3.1 Historical Topographic and Aerial Photograph Review

As part of the initial phase of investigation, area United States Geologic Survey historic topographic maps from 1903, 1930, 1943, 1953, 1967, and 1979 were reviewed. Aerial images from Google Earth were reviewed from 1996 to 2017. Based on the review, it appears that a shallow pond or vernal pool was present within the general site area prior to regional development. This feature was indicated to be within the proposed project area on the maps dating from 1943 to 1967 and to the southwest of the project area on the maps prior to 1943. The localized water feature was not shown on topographic maps post 1967.

Review of building plans for the Bank of America Central Cash Vault (existing structure at 8875 Aero Drive), prepared by Boyle Architectural Associates (no date), indicated that the existing foundation system consisted of continuous and spread footings placed on shallow structural fill. Based on the foundation schedule, the deepest footings were indicated to be two-feet nine inches below pad grades. Depth of the previously placed fill was not indicated, however, based on recent boring explorations the fill thickness surrounding the existing structure ranges from approximately five to seven feet below existing grades. In the area of the proposed parking structure the existing fill thickness is indicated to range from approximately one to four feet below existing grades.

## 3.2 Field Investigation

CTE performed the recent subsurface investigation on March 29, 2018 to evaluate underlying soil conditions. This fieldwork consisted of site reconnaissance, and the excavation of seven exploratory soil borings and seven percolation test holes. The borings were advanced to a maximum explored depth of approximately 18 feet below ground surface (bgs). Bulk samples were collected from the cuttings, and relatively undisturbed samples were collected by driving Standard Penetration Test (SPT) and Modified California (CAL) samplers. The borings and percolation test holes were excavated by a CME-95 truck-mounted drill rig equipped with eight-inch-diameter, hollow-stem augers. The percolation test holes were excavated to the depths ranging from approximately 3.0 to 5.1 feet below the ground surface (bgs). Approximate locations of the soil borings and test holes are shown on the attached Figure 2.

Soils were logged in the field by a CTE Engineering Geologist, and were visually classified in general accordance with the Unified Soil Classification System. The field descriptions have been modified, where appropriate, to reflect laboratory test results. Boring logs, including descriptions of the soils encountered, are included in Appendix B.

# 3.3 Laboratory Testing

Laboratory tests were conducted on selected soil samples for classification purposes, and to evaluate physical properties and engineering characteristics. Laboratory tests included: Maximum Density/Proctor Testing, Expansion Index, R-Value, Grain Size Analysis, Atterberg Limits,

Consolidation, and Chemical Characteristics. Test descriptions and laboratory test results are included in Appendix C.

#### 4.0 GEOLOGY

## 4.1 General Setting

San Diego is located with the Peninsular Ranges physiographic province that is characterized by its northwest-trending mountain ranges, intervening valleys, and predominantly northwest trending active regional faults. The San Diego Region can be further subdivided into the coastal plain area, a central mountain–valley area, and the eastern mountain valley area. The project site is located within the coastal plain area. The coastal plain subprovince ranges in elevation from approximately sea level to 1200 feet above mean sea level (msl) and is characterized by Cretaceous and Tertiary sedimentary deposits that onlap an eroded basement surface consisting of Jurassic and Cretaceous crystalline rocks that have been repeatedly eroded and infilled and by alluvial processes throughout the Quaternary Period in response to regional uplift. This has resulted in a geomorphic landscape of uplifted alluvial and marine terraces that are dissected by current active alluvial drainages.

## 4.2 Geologic Conditions

Based on the regional geologic map prepared by Kennedy and Tan (2008), the near surface geologic unit that underlies the site consists of Quaternary Very Old Paralic Deposits Unit 8. Based on recent explorations, Quaternary Previously Placed Fill was observed overlying the Very Old Paralic Deposits. The Tertiary Mission Valley Formation is anticipated at depth beneath the Very Old Paralic Deposits. Descriptions of the geologic and soil units encountered during the investigation are presented below.

# 4.2.1 Quaternary Previously Placed Fill

Where observed, the Previously Placed Fill generally consists of stiff or loose to medium dense, brown, fine to medium grained sandy clay and clayey sand. Exploratory excavations encountered Previously Placed Fill to a maximum observed depth of approximately seven feet (bgs). As described above in Section 3.1, the fill thickness surrounding the existing structure was found to range from approximately five to seven feet below existing grades. In the area of the proposed parking structure the fill thickness is indicated to range from approximately one to four feet below existing grades. Isolated areas with deeper fill may be encountered during site excavations and grading.

# 4.2.2 Quaternary Very Old Paralic Deposits

Quaternary Very Old Paralic Deposits, (map unit Qvop 8 of Kennedy and Tan, 2008) were observed in all the investigation borings. Where observed, these materials generally consist of medium dense to very dense, mottled gray and reddish brown, silty to clayey fine to medium grained sandstone and cobble conglomerate. This unit is anticipated at depth throughout the site.

# 4.2.3 Groundwater Conditions

Groundwater was not encountered in any of the recent borings at the time of drilling. The borings were advanced to a maximum explored depth of approximately 18 feet bgs or to an

CTE Job No. 10-14209G

approximate elevation of 399 feet msl. Review of California State Water Resources Control Board-Geotracker electronic database found several sites in the general vicinity that provided regional groundwater information. According to various studies completed for the Broadstone site located approximately 800 to 1000 feet west of the subject site, regional groundwater was reported to be approximately 75 feet bgs (an approximate elevation of 337 To the north at Montgomery Field, regional groundwater was reported at msl). approximately 100 feet bgs, or at an approximate elevation of 315 feet msl (Geosoils Inc., 1998). However, Group Delta (2012) encountered localized perched lenses of groundwater at approximately 11 feet bgs, (approximate elevation of 400 feet msl) at the Broadstone site. Approximately 1,700 feet south of the subject site, near the intersection of Sandrock Road and Hammond Drive, Santec Consulting Services (2012) reported groundwater elevations ranging from 385.81 to 393.76 feet msl, with historic groundwater elevations from 1996 through 2008 ranging from approximately 387 to 391 feet msl. Groundwater flow direction was reported to be to the south-southeast. These groundwater elevations are consistent with the relatively shallow perched groundwater elevations reported at the Broadstone site.

Based on the recent site explorations and review of groundwater data from the adjacent area, regional static groundwater is generally anticipated at depths greater than proposed excavations as recommended herein. Although no groundwater was observed during the recent drilling, localized perched groundwater conditions could potentially be present at elevations shallower than approximately 400 feet msl.

While groundwater conditions may vary, especially following periods of sustained precipitation or irrigation, it is generally not anticipated to adversely affect the proposed shallow construction activities or the completed improvements, if irrigation is limited and proper site drainage is designed, installed, and maintained per the recommendations of the project civil engineer. Seepage and perched water conditions may locally be encountered in deeper site excavations.

# 4.3 Geologic Hazards

The site is located within City of San Diego Seismic Safety Zone Geologic Hazard Categories 51 and 52. Category 51 corresponds to "level mesas – underlain by terrace deposits and bedrock, nominal risk", and Category 52 corresponds to "other level areas, gently sloping to steep terrain, favorable geologic structure, low risk."

Geologic hazards considered to have potential impacts to site development were evaluated based on field observations, literature review, and laboratory test results. The following paragraphs discuss geologic hazards considered and associated potential risk to the site.

# 4.3.1 Surface Fault Rupture

Based on the site reconnaissance and review of referenced literature, the site is not within a local fault hazard zone or State of California -designated Alquist-Priolo Earthquake Fault Studies Zone, and no known active fault traces underlie or project toward the site. According to the California Division of Mines and Geology, a fault is active if it displays

evidence of activity in the last 11,000 years (Hart and Bryant, 1997). As such, the potential for surface rupture from displacement or fault movement beneath the proposed improvements is considered to be low.

# 4.3.2 Local and Regional Faulting

The California Geological Survey (CGS) and the United States Geological Survey (USGS) broadly group faults as "Class A" or "Class B" (Cao, 2003; Frankel et al., 2002). Class A faults are identified based upon relatively well-defined paleoseismic activity, and a fault-slip rate of more than 5 millimeters per year (mm/yr). In contrast, Class B faults have comparatively less defined paleoseismic activity and are considered to have a fault-slip rate less than 5 mm/yr. The nearest known Class B fault is the Rose Canyon Fault, which is approximately 7.0 kilometers southwest of the site (Blake, T.F., 2000). The nearest known Class A fault is the Julian segment of the Elsinore Fault, which is located approximately 57.6 kilometers northeast of the site.

The site could be subjected to significant shaking in the event of a major earthquake on any of the faults noted above or other faults in the southern California or northern Baja California area.

## 4.3.3 Liquefaction and Seismic Settlement Evaluation

Liquefaction occurs when saturated fine-grained sands or silts lose their physical strengths during earthquake-induced shaking and behave like a liquid. This is due to loss of point-to-point grain contact and transfer of normal stress to the pore water. Liquefaction

potential varies with water level, soil type, material gradation, relative density, and probable intensity and duration of ground shaking. Seismic settlement can occur with or without liquefaction; it results from densification of loose soils.

The site is underlain at shallow depths by medium dense to very dense formational materials (Very Old Paralic Deposits). Based on the noted subsurface conditions, the potential for liquefaction or significant seismic settlement at the site is considered to be low.

# 4.3.4 Tsunamis and Seiche Evaluation

According to McCulloch (1985), the potential in the San Diego County coastal area for "100-year" and "500-year" tsunami waves is approximately five and eight feet, or less. This suggests that there is a negligible probability of a tsunami reaching the site based on elevation of the area and distance from the Pacific Ocean. The site is not located in a zone of potential tsunami inundation based on emergency planning maps prepared by California Emergency Management Agency and CGS. In addition, oscillatory waves (seiches) are considered unlikely due to the absence of nearby confined bodies of water.

# 4.3.5 Landsliding

According to mapping by Tan (1995), the site is considered to be only "Marginally Susceptible" to landsliding, and no landslides are mapped in the site area. In addition, evidence of landslides or landslide potential was not observed during the field exploration at the relatively flat-lying site. Based on these findings, landsliding is not considered to be a significant geologic hazard at the subject site.

## 4.3.6 Compressible and Expansive Soils

Portions of the Previously Placed Fill soils are considered to be compressible in their current condition. Therefore, it is recommended that these soils be overexcavated, where necessary, and properly compacted beneath proposed improvement areas as recommended herein and as determined to be necessary during construction. Based on the field data, site observations, and CTE's experience with similar soils in the vicinity of the site, dense native soils underlying the site are not considered to be subject to significant compressibility under the proposed loads.

Based on laboratory testing and the generally granular nature of the subgrade materials, soils at the site are anticipated to exhibit Low expansion potential (Expansion Index of 50 or less). Therefore, expansive soils are generally not anticipated to present significant adverse impacts to site development if geotechnical recommendations are properly implemented. Additional evaluation of near-surface soils should be performed based on field observations during grading and excavation activities.

#### 4.3.7 Corrosive Soils

Testing of representative site soils was performed to evaluate the potential corrosive effects on concrete foundations and buried metallic utilities. Soil environments detrimental to concrete generally have elevated levels of soluble sulfates and/or pH levels less than 5.5. According to the American Concrete Institute (ACI) Table 318 4.3.1, specific guidelines have been provided for concrete where concentrations of soluble sulfate (SO<sub>4</sub>) in soil exceed 0.10 percent by weight. These guidelines include low water:cement ratios, increased \\ESC SERVER\Projects\10-14209G\Rpt Geotechnical (May 2018).doc

#### CTE Job No. 10-14209G

compressive strength, and specific cement type requirements. A minimum resistivity value less than approximately 5,000 ohm-cm and/or soluble chloride levels in excess of 200 ppm generally indicate a corrosive environment for buried metallic utilities and untreated conduits.

Chemical test results indicate that near-surface soils at the site generally present a negligible corrosion potential for Portland cement concrete. Based on resistivity and chloride testing, the site soils have been interpreted to have a moderate to severe corrosivity potential to buried metal improvements.

Based on the results of the limited testing performed, it is likely prudent to utilize plastic piping and conduits where buried and feasible. However, CTE does not practice corrosion engineering. Therefore, if corrosion of metallic or other improvements is of more significant concern, a qualified corrosion engineer could be consulted.

#### 5.0 STORMWATER INFILTRATION - PRELIMINARY FESIBILITY SCREENING

#### 5.1 Purpose

As part of the geotechnical site assessment, CTE completed a preliminary feasibility screening of the subject site for storm water infiltration. The preliminary screening was completed in accordance with the City of San Diego Storm Water Standards (January 2018) for the purpose of providing geotechnical-geologic characteristics, groundwater information, and estimates of vertical infiltration

rates that can be incorporated by the project Storm Water Quality Management Plan (SWQMP) preparer (e.g. Project Architect, Civil Engineer), in the process of developing a comprehensive storm water management plan. The information can also be used to facilitate the final storm water design in accordance with the water quality and hydro modification criteria of the MS4 permitting process.

# 5.2 Test Procedures

The shallow borehole percolation methodology was used to establish percolation rates. This is considered an acceptable method of percolation testing, as stated in the City of San Diego BMP Design Manual, Appendix D (February, 2018). The percolation test procedure was completed in general accordance with the County of San Diego Department of Environmental Health (DEH), Version 2010 guidelines. The percolation rates account for both lateral and vertical flow through the tested section. The derived percolation rates were then converted to infiltration rates following the procedures of the Porchet Method, as recommended by the BMP Design Manual, Appendix D (February, 2018). The percolation test methodology, field data, and infiltration conversion calculations are presented in Appendix E. The Model BMP Design Manual, Worksheet C.4.1 "Categorization of Infiltration Feasibility Conditions", is also presented in Appendix E.

## 5.3 Site Background and Characterization

Review of the Natural Resources Conservation Service (NRCS) website indicates that agricultural soil types in the site area are classified as Redding gravelly loam, gravelly clay, and gravelly clay loam (Map Unit-Rdc). The Rdc map unit, as defined by the NRCS, is assigned a hydrologic soil group (D), in accordance with the United States Department of Agriculture (USDA). These USDA soil types were generally confirmed with the geotechnical logs of borings from the recent investigation, as described in Section 4.2.1 and 4.2.2 above, which encountered Quaternary Very Old Paralic Deposits (Map Unit Qop- 8 of Kennedy and Tan, 2008), and Quaternary Previously Placed Fill consisting of re-worked formational deposits.

As described in Section 4.2.3, regional static groundwater elevations are estimated to be 76 to 83 feet below existing grades. Groundwater was not encountered at the time of drilling during our recent investigation to depths of approximately 18 feet bgs. However, based on review of adjacent projects, perched groundwater could be expected at depths ranging from approximately 22 to 33 feet bgs.

As the project is in the conceptual phase of design, percolation test borings were conducted in representative areas such that the entire site would be accurately characterized in terms of infiltration potential. In total, seven percolation test borings were advanced to depths ranging from approximately three to five feet below existing grades.

## 5.3 Percolation Test Results and Calculated Infiltration Rates

The following table presents a summary of the percolation test results conducted within the subject site, the soil type encountered in each test boring, the depth of each test boring, the derived percolation rate, the calculated infiltration rate, and a recommended design rate derived by applying a safety factor of two to the calculated infiltration rate in accordance with the City of San Diego BMP Design Manual, Appendix D (January, 2018). The percolation tests met Case I conditions (Appendix E).

| TABLE 5.3<br>SUMMARY OF PERCOLATION AND INFILTRATION TEST RESULTS |           |             |          |               |                   |                  |  |  |
|---|-----------|-------------|----------|---------------|-------------------|------------------|--|--|
| Test  | Soil Type | San Diego   | Depth    | Percolation   | Infiltration Rate | Recommended      |  |  |
| Location  |           | County      | (inches) | Rate          | (inches/hour)     | Rate for Design* |  |  |
|   |           | Percolation |          | (inches/hour) |                   | (inches/hour)    |  |  |
|   |           | Procedure   |          |               |                   |                  |  |  |
| P-1   | Qvop      | Case I      | 61       | 0.13          | 0.025             | 0.013            |  |  |
| P-2   | Qvop      | Case I      | 36       | 0.13          | 0.027             | 0.013            |  |  |
| P-3   | Qvop      | Case I      | 59       | 0.00          | 0.00              | 0.000            |  |  |
| P-4   | Qppf      | Case I      | 37       | 0.12          | 0.027             | 0.014            |  |  |
| P-5   | Qppf      | Case I      | 60       | 0.13          | 0026              | 0.013            |  |  |
| P-6   | Qvop      | Case I      | 60       | 0.13          | 0.024             | 0.012            |  |  |
| P-7   | Qppf      | Case I      | 61       | 0.00          | 0.00              | 0.000            |  |  |

\* A safety factor of two (2) was applied to the calculated infiltration rate

Qvop = Quaternary Very Old Paralic Deposits, (Map Unit Qop- 8 of Kennedy and Tan, 2008)

The calculated infiltration rates within both the Quaternary Very Old Paralic Deposits and the Quaternary Previously Placed Fill were all found to be below the defined lower boundary infiltration of rate of 0.05 inches per hour for partial infiltration as defined by the City of San Diego BMP Design Manual (January 2018), Appendix C. For Planning Phase feasibility screening and design of partial infiltration BMP's, a factor of safety of 2 is required in accordance with Appendix C of the

City of San Diego BMP Design Manual (January 2018). As shown in the above table, this further reduces the infiltration below the cutoff rate for partial infiltration classification. As such, the results of the preliminary site screening indicate that the site classifies as a "No Infiltration Condition".

# 5.4 Infiltration Recommendations

Although the preliminary screening indicates that the entire site classifies as not suitable for partial infiltration, the SWQMP preparer could consider modification of the existing site soils for a proposed BMP infiltration basin provided the potential modified basin area conforms with all structural setback criteria as defined in Appendix C of the City of San Diego BMP Design Manual (January 2018). The main structural setbacks at the site would be distances from building foundations and utility trenches. The site is considered feasible with respect to other geotechnical-geologic criteria including depths to groundwater, expansive soils, settlement or volume change, and slope stability. Replacement of existing soils with improved infiltration feasibility soils could be an option provided the BMP dimensions are capable of temporarily storing DMA water volumes associated with the underlying lower infiltration rates as documented as part of this feasibility screening.

#### 6.0 CONCLUSIONS AND RECOMMENDATIONS

#### 6.1 General

CTE concludes that the proposed improvements on the site are feasible from a geotechnical standpoint, provided the preliminary recommendations in this report are incorporated into the design and construction of the project. Recommendations for the proposed earthwork and improvements are included in the following sections and Appendix D. However, recommendations in the text of this report supersede those presented in Appendix D should conflicts exist. These preliminary recommendations should either be confirmed as appropriate or updated following required excavations, demolition of existing improvements, and observations during site preparation.

#### 6.2 Site Preparation

Prior to grading, the site should be cleared of existing construction debris and vegetation, not suitable for structural backfill and be properly disposed of offsite. In areas to receive structural improvements, overexcavation beneath slab areas should extend to a minimum depth of two feet below finish subgrade. Foundation elements for both the existing building modifications and the new proposed parking structure are to be extended to the depth of dense native materials.

Excavations adjacent to the existing structure should generally not extend below a 1:1 plane extended down from the bottom of existing footings or as recommended during grading based on the exposed conditions. Depending on the depth and proximity of the existing building footings to remain, alternating slot excavations could be required during earthwork.

Overexcavations for proposed surface improvement areas, such as pavement or flatwork should be conducted to a depth of two feet below proposed subgrade.

If encountered, existing below-ground utilities should be redirected around proposed structures. Existing utilities at an elevation to extend through the proposed footings should generally be sleeved and caulked to minimize the potential for moisture migration below the building slabs. Abandoned pipes exposed by grading should be securely capped or filled with minimum two-sack cement/sand slurry to help prevent moisture from migrating beneath foundation and slab soils.

A CTE representative should observe the exposed ground surface prior to placement of compacted fill to document and verify the competency of the encountered subgrade materials. If unsuitable material is exposed at the base of excavations additional removals may be recommended. After approval by this office, the exposed subgrades to receive fill should be scarified a minimum of eight inches, moisture conditioned, and properly compacted prior to additional compacted fill placement.

#### 6.3 Site Excavation

Based on CTE's observations, shallow excavations at the site should be feasible using wellmaintained heavy-duty construction equipment run by experienced operators. However, localized very dense zones consisting of cemented conglomerate formation may be encountered, which could result in very difficult excavation.

#### 6.4 Fill Placement and Compaction

Following the recommended overexcavation of loose or disturbed soils, the areas to receive fills should be scarified approximately eight inches, moisture conditioned, and properly compacted. Fill and backfill should be compacted to a minimum relative compaction of 90 percent at a moisture content of at least two percent above optimum, as evaluated by ASTM D 1557. The optimum lift thickness for fill soil depends on the type of compaction equipment used. Generally, backfill should be placed in uniform, horizontal lifts not exceeding eight inches in loose thickness. Fill placement and compaction should be conducted in conformance with local ordinances, and should be observed and tested by a CTE geotechnical representative.

#### 6.5 Fill Materials

Properly moisture-conditioned very low to low expansion potential soils derived from the on-site excavations are considered suitable for reuse on the site as compacted fill. If used, these materials should be screened of organics and materials generally greater than three inches in maximum dimension. Irreducible materials greater than three inches in maximum dimension should generally not be used in shallow fills (within three feet of proposed grades). In utility trenches, adequate bedding should surround pipes.

Imported fill beneath structures, flatwork, and pavements should have an Expansion Index of 20 or less (ASTM D 4829). Proposed import fill soils for use in structural or slope areas should be evaluated by the geotechnical engineer before being transported to the site.

If retaining walls are proposed, backfill located within a 45-degree wedge extending up from the heel of the wall should consist of soil having an Expansion Index of 20 or less (ASTM D 4829) with less than 30 percent passing the No. 200 sieve. The upper 12 to 18 inches of wall backfill should consist of lower permeability soils, in order to reduce surface water infiltration behind walls. The project structural engineer and/or architect should detail proper wall backdrains, including gravel drain zones, fills, filter fabric, and perforated drain pipes. A conceptual wall backdrain detail, which may be suitable for use at the site, is provided as Figure 4.

### 6.6 Temporary Construction Slopes

The following recommended slopes should be relatively stable against deep-seated failure, but may experience localized sloughing. On-site soils are considered Type B and Type C soils with recommended slope ratios as set forth in Table 6.6.

| TABLE 6.6<br>RECOMMENDED TEMPORARY SLOPE RATIOS |                                       |                |  |  |  |  |  |  |
|---|---------------------------------------|----------------|--|--|--|--|--|--|
| SOIL TYPE                                       | SLOPE RATIO<br>(Horizontal: vertical) | MAXIMUM HEIGHT |  |  |  |  |  |  |
| B (Very Old Paralic Deposits)                   | 1:1 (OR FLATTER)                      | 10 Feet        |  |  |  |  |  |  |
| C (Previously Placed Fill)                      | 1.5:1 (OR FLATTER)                    | 10 Feet        |  |  |  |  |  |  |

Actual field conditions and soil type designations must be verified by a "competent person" while excavations exist, according to Cal-OSHA regulations. In addition, the above sloping recommendations do not allow for surcharge loading at the top of slopes by vehicular traffic, equipment or materials. Appropriate surcharge setbacks must be maintained from the top of all unshored slopes.

#### 6.7 Foundations and Slab Recommendations

The following recommendations are for preliminary design purposes only. These foundation recommendations should be re-evaluated after review of the project grading and foundation plans, and after completion of rough grading of the building pad areas. Upon completion of rough pad grading, Expansion Index of near surface soils should be verified, and these recommendations should be updated, if necessary.

#### 6.7.1 Foundations

Foundation recommendations presented herein are based on the anticipated low expansion potential of site soils (Expansion Index of 50 or less).

Following the recommended preparatory grading, continuous and isolated spread footings are anticipated to be suitable for use at this site. Foundation dimensions and reinforcement should be based on allowable bearing values of 4,000 pounds per square foot (psf) for minimum 18-inch wide footings embedded a minimum of 36-inches below lowest adjacent subgrade elevation and extended to the depth of dense native formational material, as

required. Isolated footings should be at least 24 inches in minimum dimension. The allowable bearing value may be increased by 250 psf for each additional six inches of embedment up to a maximum of 6,500 psf. The allowable bearing value may also be increased by one-third for short-duration loading, which includes the effects of wind or seismic forces.

In order to approximate minimum required footing depths, it is anticipated that suitable dense native bearing material will be encountered at, or slightly below, the bottom of existing fills. Approximate fill depths based on the investigation findings are shown on Figure 2. Localized areas of deeper fill or unsuitable soils may be encountered that would require deeper excavation for proposed footings.

Minimum reinforcement for continuous footings should consist of four No. 6 reinforcing bars; two placed near the top and two placed near the bottom, or as per the project structural engineer. The structural engineer should design isolated footing reinforcement. An uncorrected subgrade modulus of 140 pounds per cubic inch is considered suitable for elastic foundation design.

The structural engineer should provide recommendations for reinforcement of any spread footings and footings with pipe penetrations. Footing excavations should generally be maintained above optimum moisture content until concrete placement.

#### 6.7.2 Foundation Settlement

For structures founded on footings extended to dense native material, the maximum total static settlement is expected to be on the order of one inch and the maximum differential settlement is expected to be on the order of 0.5 inch over a distance of 50 feet. Due to the nature of underlying materials, dynamic settlement is not expected to significantly affect the proposed buildings.

#### 6.7.3 Foundation Setback

Footings for structures should be designed such that the horizontal distance from the face of adjacent slopes to the outer edge of the footing is at least 10 feet. In addition, footings should bear beneath a 1:1 plane extended up from the nearest bottom edge of adjacent trenches and/or excavations. Deepening of affected footings may be a suitable means of attaining the prescribed setbacks.

#### 6.7.4 Interior Concrete Slabs

Lightly loaded interior concrete slabs for non-traffic areas should be a minimum of 5.0 inches thick, or slabs should be designed to match existing thickness at building modification boundaries per recommendations of the project structural engineer. Minimum reinforcement for lightly loaded slabs should consist of #4 reinforcing bars placed on maximum 18-inch centers, each way, at or above mid-slab height, but with proper cover or as per the recommendations of the project structural engineer.

CTE Job No. 10-14209G

In moisture-sensitive non-traffic floor areas, a suitable vapor retarder of at least 15-mil thickness (with all laps or penetrations sealed or taped) overlying a four-inch layer of consolidated aggregate base or gravel (with SE of 30 or more) should be installed. An optional maximum two-inch layer of similar material may be placed above the vapor retarder to help protect the membrane during steel and concrete placement. This recommended protection is generally considered typical in the industry. If proposed floor areas or coverings are considered especially sensitive to moisture emissions, additional recommendations from a specialty consultant could be obtained. CTE is not an expert at preventing moisture penetration through slabs. A qualified architect or other experienced professional should be contacted if moisture penetration is a more significant concern.

Parking garage slabs subjected to heavier loads and traffic will require thicker slab sections and/or increased reinforcement. Minimum underlayment for the parking garage slab is to consist of 6 inches of non-recycled class 2 base. Aggregate base and the upper foot of underlying subgrade are to be compacted to 95% relative compaction.

A 110-pci subgrade modulus is considered suitable for elastic design of minimally embedded improvements such as slabs-on-grade.

Subgrade materials should be maintained at a minimum of two percent above optimum moisture content until slab underlayment and concrete are placed.

#### 6.8 Seismic Design Criteria

The seismic ground motion values listed in the table below were derived in accordance with the ASCE 7-10 Standard. This was accomplished by establishing the Site Class based on the soil properties at the site, and calculating the site coefficients and parameters using the United States Geological Survey Seismic Design Maps application. These values are intended for the design of structures to resist the effects of earthquake ground motions for the site coordinates 32.8088° latitude and  $-117.1374^{\circ}$  longitude, as underlain by soils corresponding to site Class C.

| TABLE 6.8<br>SEISMIC GROUND MOTION VALUES (CODE-BASED)<br>2016 CBC AND ASCE 7-10 |       |                                 |  |  |  |  |  |  |
|--|-------|---------------------------------|--|--|--|--|--|--|

#### 6.9 Lateral Resistance and Earth Pressures

Lateral loads acting against structures may be resisted by friction between the footings and the supporting soil or passive pressure acting against structures. If frictional resistance is used, allowable coefficients of friction of 0.30 (total frictional resistance equals the coefficient of friction multiplied by the dead load) for concrete cast directly against compacted fill is recommended. A design passive resistance value of 250 pounds per square foot per foot of depth (with a maximum value of 2,500 pounds per square foot) may be used. The allowable lateral resistance can be taken as the sum of the frictional resistance and the passive resistance, provided the passive resistance does not exceed two-thirds of the total allowable resistance.

Retaining walls backfilled using granular soils may be designed using the equivalent fluid unit weights given in Table 6.9 below.

| TABLE 6.9<br>EQUIVALENT FLUID UNIT WEIGHTS (G <sub>h</sub> )<br>(pounds per cubic foot) |                |   |  |  |  |  |  |  |
|---|----------------|---|--|--|--|--|--|--|
| WALL TYPE   | LEVEL BACKFILL | SLOPE BACKFILL<br>2:1 (HORIZONTAL:<br>VERTICAL) |  |  |  |  |  |  |
| CANTILEVER WALL<br>(YIELDING)   | 35             | 55  |  |  |  |  |  |  |
| RESTRAINED WALL   | 55             | 65  |  |  |  |  |  |  |

Lateral pressures on cantilever retaining walls (yielding walls) over six feet high due to earthquake motions may be calculated based on work by Seed and Whitman (1970). The total

lateral earth pressure against a properly drained and backfilled cantilever retaining wall above the groundwater level can be expressed as:

 $P_{AE} = P_A + \Delta P_{AE}$ 

For non-yielding (or "restrained") walls, the total lateral earth pressure may be similarly calculated based on work by Wood (1973):

 $P_{KE} = P_K + \Delta P_{KE}$ 

Where  $P_A/b$  = Static Active Earth Pressure =  $G_h H^2/2$ 

 $P_{\rm K}/b$  = Static Restrained Wall Earth Pressure =  $G_{\rm h} {\rm H}^2/2$ 

 $\Delta P_{AE}/b$  = Dynamic Active Earth Pressure Increment = (3/8) k<sub>h</sub>  $\gamma H^2/2$ 

 $\Delta P_{KE}/b$  = Dynamic Restrained Earth Pressure Increment =  $k_h \gamma H^2/2$ 

b = unit length of wall

 $k_h = 2/3 PGA_m$  (PGA<sub>m</sub> given previously Table 6.8)

 $G_h$  = Equivalent Fluid Unit Weight (given previously Table 6.9)

H = Total Height of the retained soil

 $\gamma$  = Total Unit Weight of Soil  $\approx$  135 pounds per cubic foot

The static and increment of dynamic earth pressure in both cases may be applied with a line of action located at H/3 above the bottom of the wall (SEAOC, 2013).

#### CTE Job No. 10-14209G

These values assume non-expansive backfill and free-draining conditions. Measures should be taken to prevent moisture buildup behind all retaining walls. Drainage measures should include freedraining backfill materials and sloped, perforated drains. These drains should discharge to an appropriate off-site location. Figure 4 shows a conceptual wall backdrain detail that may be suitable for walls at the subject site. Waterproofing should be as specified by the project architect.

#### 6.10 Exterior Flatwork

Flatwork should be installed with crack-control joints at appropriate spacing as designed by the project architect to reduce the potential for cracking in exterior flatwork caused by minor movement of subgrade soils and concrete shrinkage. Additionally, it is recommended that flatwork be installed with at least number 4 reinforcing bars at 24-inch centers, each way, at or above mid-height of slab, but with proper concrete cover, or with other reinforcement per the applicable project designer. Flatwork that should be installed with crack control joints, includes driveways, sidewalks, and architectural features. All subgrades should be prepared according to the earthwork recommendations previously given before placing concrete. Positive drainage should be established and maintained next to all flatwork. Subgrade materials should be maintained at a minimum of two percent above optimum moisture content until the time of concrete placement.

#### 6.11 Vehicular Pavement

The proposed improvements include paved vehicle drive and parking areas. Presented in Table 6.11 are preliminary pavement sections utilizing laboratory determined Resistance "R" Value. Actual traffic area slab sections to be provided by the structural designer. Beneath proposed pavement areas, the upper 12 inches of subgrade and all base materials should be compacted to 95% relative compaction in accordance with ASTM D1557, and at a minimum of two percent above optimum moisture content.

| TABLE 6.11<br>RECOMMENDED PAVEMENT THICKNESS |                          |                                      |  |                          |     |  |  |  |  |  |
|--|--------------------------|--------------------------------------|--|--------------------------|-----|--|--|--|--|--|
| Traffic Area                                 | Assumed<br>Traffic Index | Preliminary<br>Subgrade<br>"R"-Value | Asphalt F<br>AC<br>Thickness<br>(inches) | Thickness Aggregate Base |     |  |  |  |  |  |

\* Caltrans Class 2 aggregate base

\*\* Concrete should have a modulus of rupture of at least 600 psi

Following rough site grading, CTE recommends laboratory testing of representative subgrade soils

for as-graded "R"-Value.

Asphalt paved areas should be designed, constructed, and maintained in accordance with the recommendations of the Asphalt Institute, or other widely recognized authority. Concrete paved areas should be designed and constructed in accordance with the recommendations of the American

Concrete Institute or other widely recognized authority, particularly with regard to thickened edges, joints, and drainage. The Standard Specifications for Public Works construction ("Greenbook") or Caltrans Standard Specifications may be referenced for pavement materials specifications.

#### 6.12 Drainage

Surface runoff should be collected and directed away from improvements by means of appropriate erosion-reducing devices and positive drainage should be established around the proposed improvements. Positive drainage should be directed away from improvements at a gradient of at least two percent for a distance of at least five feet. However, the project civil engineers should evaluate the on-site drainage and make necessary provisions to keep surface water from affecting the site.

Generally, CTE recommends against allowing water to infiltrate building pads or adjacent to slopes. CTE understands that some agencies are encouraging the use of storm-water cleansing devices. Use of such devices tends to increase the possibility of adverse effects associated with high groundwater including slope instability and liquefaction. See Appendix E for further discussion of site infiltration.

#### 6.12 Slopes

Based on anticipated soil strength characteristics, fill slopes if proposed, should be constructed at slope ratios of 2:1 (horizontal: vertical) or flatter. These fill slope inclinations should exhibit factors of safety greater than 1.5.

Although properly constructed slopes on this site should be grossly stable, the soils will be somewhat erodible. Therefore, runoff water should not be permitted to drain over the edges of slopes unless that water is confined to properly designed and constructed drainage facilities. Erosion-resistant vegetation should be maintained on the face of all slopes.

Typically, soils along the top portion of a fill slope face will creep laterally. CTE recommends against building distress-sensitive hardscape improvements within five feet of slope crests, and against using thickened edges in this area.

#### 6.13 Controlled Low Strength Materials (CLSM)

Controlled Low Strength Materials (CLSM) may be used in deepened footing excavation areas, building pads, and/or adjacent to retaining walls or other structures, provided the appropriate following recommendations are also incorporated. Minimum overexcavation depths recommended herein beneath slabs, flatwork, and other areas may be applicable beneath CLSM if/where CLSM is to be used, and excavation bottoms should be observed by CTE prior to placement of CLSM. Prior to CLSM placement, the excavation should be free of debris, loose soil materials, and water. Once specific areas to utilize CLSM have been determined, CTE should review the locations to determine if additional recommendations are appropriate.

CLSM should consist of a minimum three-sack cement/sand slurry with a minimum 28-day compressive strength of 100 psi (or equal to or greater than the maximum allowable short term soil bearing pressure provided herein, whichever is higher) as determined by ASTM D4832. If re-

excavation is anticipated, the compressive strength of CLSM should generally be limited to a maximum of 150 psi per ACI 229R-99. Where re-excavation is required, two-sack cement/sand slurry may be used to help limit the compressive strength. The allowable soils bearing pressure and coefficient of friction provided herein should still govern foundation design. CLSM may not be used in lieu of structural concrete where required by the structural engineer.

#### 6.14 Plan Review

CTE should be authorized to review the project grading and foundation plans prior to commencement of earthwork in order to provide additional recommendations, if necessary.

#### 6.15 Construction Observation

The recommendations provided in this report are based on preliminary design information for the proposed construction and the subsurface conditions observed in the soil borings. The interpolated subsurface conditions should be checked by CTE during construction with respect to anticipated conditions. Upon completion of precise grading, if necessary, soil samples will be collected to evaluate as-built Expansion Index. Foundation recommendations may be revised upon completion of grading, and as-built laboratory tests results. Additionally, soil samples should be taken in pavement subgrade areas upon rough grading to refine pavement recommendations as necessary.

Recommendations provided in this report are based on the understanding and assumption that CTE will provide the observation and testing services for the project. All earthwork should be observed and tested in accordance with recommendations contained within this report. CTE should evaluate footing excavations before reinforcing steel placement.

#### 7.0 LIMITATIONS OF INVESTIGATION

The field evaluation, laboratory testing and geotechnical analysis presented in this report have been conducted according to current engineering practice and the standard of care exercised by reputable geotechnical consultants performing similar tasks in this area. No other warranty, expressed or implied, is made regarding the conclusions, recommendations and opinions expressed in this report. Variations may exist and conditions not observed or described in this report may be encountered during construction. This report is prepared for the project as described. It is not prepared for any other property or party.

The recommendations provided herein have been developed in order to reduce the post-construction movement of site improvements. However, even with the design and construction recommendations presented herein, some post-construction movement and associated distress may occur.

The findings of this report are valid as of the present date. However, changes in the conditions of a property can occur with the passage of time, whether they are due to natural processes or the works of man on this or adjacent properties. In addition, changes in applicable or appropriate standards may occur, whether they result from legislation or the broadening of knowledge. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside CTE's involvement. Therefore, this report is subject to review and should not be relied upon after a period of three years.

CTE's conclusions and recommendations are based on an analysis of the observed conditions. If conditions different from those described in this report are encountered, CTE should be notified and additional recommendations, if required, will be provided subject to CTE remaining as authorized geotechnical consultant of record. This report is for use of the project as described. It should not be utilized for any other project.

The percolation test results were obtained in accordance with City and County standards and were performed with the standard of care practiced by other professionals practicing in the area. However, percolation test results can significantly vary laterally and vertically due to slight changes in soil type, degree of weathering, secondary mineralization, and other physical and chemical variabilities. As such, the test results are only considered as an estimate of percolation and converted infiltration rates for design purposes. No guarantee is made based on the percolation testing to the actual functionality or longevity of associated infiltration basins or other BMP devices designed from the presented infiltration rates.

CTE Job No. 10-14209G

Page 35

CTE's conclusions and recommendations are based on an analysis of the observed conditions. If conditions different from those described in this report are encountered during construction, this office should be notified and additional recommendations, if required, will be provided.

CTE appreciate this opportunity to be of service on this project. If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Respectfully submitted,

# APPENDIX C

# LABORATORY METHODS AND RESULTS

### LABORATORY METHODS AND RESULTS

#### Laboratory Testing Program

Laboratory tests were performed on representative soil samples to detect their relative engineering properties. Tests were performed following test methods of the American Society for Testing Materials or other accepted standards. The following presents a brief description of the various test methods used.

#### **Classification**

Soils were classified visually according to the Unified Soil Classification System. Visual classifications were supplemented by laboratory testing of selected samples according to ASTM D2487. The soil classifications are shown on the Exploration Logs in Appendix B.

#### Modified Proctor

Laboratory maximum dry density and optimum moisture content were evaluated according to ASTM D 1557, Method A. A mechanically operated rammer was used during the compaction process.

#### Expansion Index

Expansion testing was performed on selected samples of the matrix of the on-site soils according to ASTM D 4829.

#### Resistance "R"-Value

The resistance "R"-value was determined by the California Materials Method No. 301 for representative subbase soils. Samples were prepared and exudation pressure and "R"-value determined. The graphically determined "R"- value at exudation pressure of 300 psi is the value used for pavement section calculation.

#### Particle-Size Analysis

Particle-size analyses were performed on selected representative samples according to ASTM D 422.

#### Atterberg Limits

The procedure of ASTM D4518-84 was used to measure the liquid limit, plastic limit and plasticity index of representative samples.

#### **Consolidation**

To assess their compressibility and volume change behavior when loaded and wetted, relatively undisturbed samples of representative samples from the investigation were subject to consolidation tests in accordance with ASTM D 2435.

#### Chemical Analysis

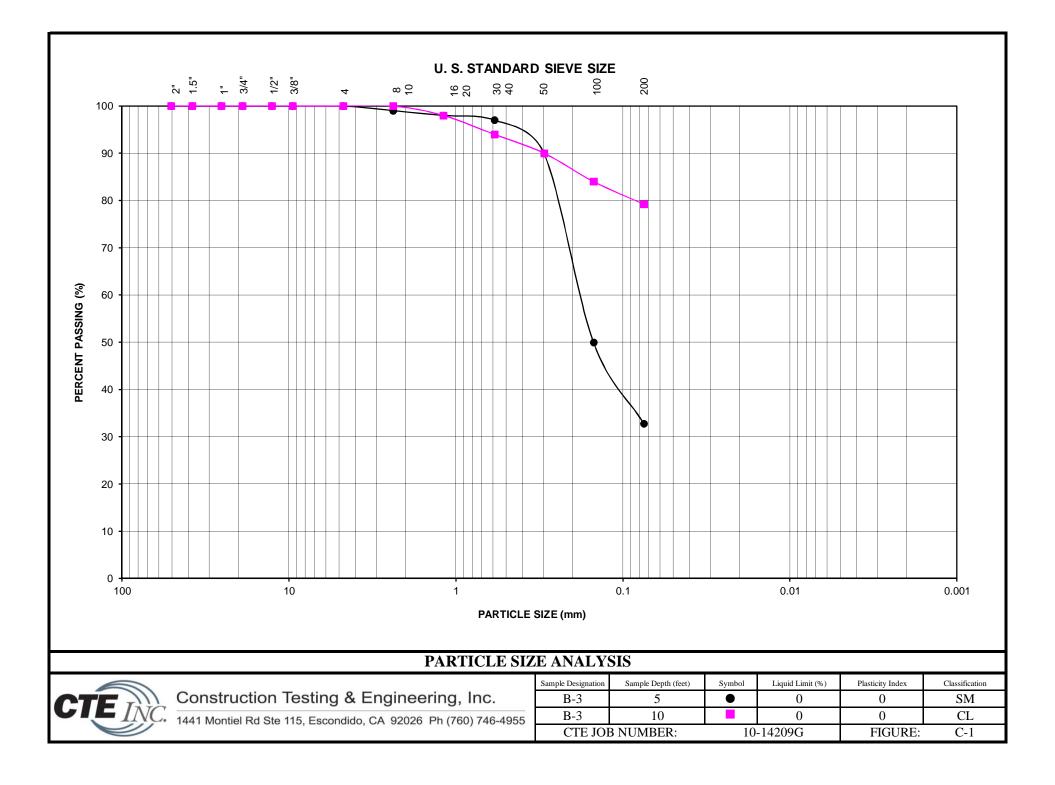

Soil materials were collected with sterile sampling equipment and tested for Sulfate and Chloride content, pH, Corrosivity, and Resistivity.

## APPENDIX D

# STANDARD SPECIFICATIONS FOR GRADING

### Section 1 - General

Construction Testing & Engineering, Inc. presents the following standard recommendations for grading and other associated operations on construction projects. These guidelines should be considered a portion of the project specifications. Recommendations contained in the body of the previously presented soils report shall supersede the recommendations and or requirements as specified herein. The project geotechnical consultant shall interpret disputes arising out of interpretation of the recommendations contained in the soils report or specifications contained herein.

### Section 2 - Responsibilities of Project Personnel

The <u>geotechnical consultant</u> should provide observation and testing services sufficient to general conformance with project specifications and standard grading practices. The geotechnical consultant should report any deviations to the client or his authorized representative.

The <u>Client</u> should be chiefly responsible for all aspects of the project. He or his authorized representative has the responsibility of reviewing the findings and recommendations of the geotechnical consultant. He shall authorize or cause to have authorized the Contractor and/or other consultants to perform work and/or provide services. During grading the Client or his authorized representative should remain on-site or should remain reasonably accessible to all concerned parties in order to make decisions necessary to maintain the flow of the project.

The Contractor is responsible for the safety of the project and satisfactory completion of all grading and other associated operations on construction projects, including, but not limited to, earth work in accordance with the project plans, specifications and controlling agency requirements.

#### Section 3 - Preconstruction Meeting

A preconstruction site meeting should be arranged by the owner and/or client and should include the grading contractor, design engineer, geotechnical consultant, owner's representative and representatives of the appropriate governing authorities.

#### Section 4 - Site Preparation

The client or contractor should obtain the required approvals from the controlling authorities for the project prior, during and/or after demolition, site preparation and removals, etc. The appropriate approvals should be obtained prior to proceeding with grading operations.

Clearing and grubbing should consist of the removal of vegetation such as brush, grass, woods, stumps, trees, root of trees and otherwise deleterious natural materials from the areas to be graded. Clearing and grubbing should extend to the outside of all proposed excavation and fill areas.

Demolition should include removal of buildings, structures, foundations, reservoirs, utilities (including underground pipelines, septic tanks, leach fields, seepage pits, cisterns, mining shafts, tunnels, etc.) and other man-made surface and subsurface improvements from the areas to be graded. Demolition of utilities should include proper capping and/or rerouting pipelines at the project perimeter and cutoff and capping of wells in accordance with the requirements of the governing authorities and the recommendations of the geotechnical consultant at the time of demolition.

Trees, plants or man-made improvements not planned to be removed or demolished should be protected by the contractor from damage or injury.

Debris generated during clearing, grubbing and/or demolition operations should be wasted from areas to be graded and disposed off-site. Clearing, grubbing and demolition operations should be performed under the observation of the geotechnical consultant.

#### Section 5 - Site Protection

Protection of the site during the period of grading should be the responsibility of the contractor. Unless other provisions are made in writing and agreed upon among the concerned parties, completion of a portion of the project should not be considered to preclude that portion or adjacent areas from the requirements for site protection until such time as the entire project is complete as identified by the geotechnical consultant, the client and the regulating agencies.

Precautions should be taken during the performance of site clearing, excavations and grading to protect the work site from flooding, ponding or inundation by poor or improper surface drainage. Temporary provisions should be made during the rainy season to adequately direct surface drainage away from and off the work site. Where low areas cannot be avoided, pumps should be kept on hand to continually remove water during periods of rainfall.

Rain related damage should be considered to include, but may not be limited to, erosion, silting, saturation, swelling, structural distress and other adverse conditions as determined by the geotechnical consultant. Soil adversely affected should be classified as unsuitable materials and should be subject to overexcavation and replacement with compacted fill or other remedial grading as recommended by the geotechnical consultant.

# STANDARD SPECIFICATIONS OF GRADING Page 2 of 26

The contractor should be responsible for the stability of all temporary excavations. Recommendations by the geotechnical consultant pertaining to temporary excavations (e.g., backcuts) are made in consideration of stability of the completed project and, therefore, should not be considered to preclude the responsibilities of the contractor. Recommendations by the geotechnical consultant should not be considered to preclude requirements that are more restrictive by the regulating agencies. The contractor should provide during periods of extensive rainfall plastic sheeting to prevent unprotected slopes from becoming saturated and unstable. When deemed appropriate by the geotechnical consultant or governing agencies the contractor shall install checkdams, desilting basins, sand bags or other drainage control measures.

In relatively level areas and/or slope areas, where saturated soil and/or erosion gullies exist to depths of greater than 1.0 foot; they should be overexcavated and replaced as compacted fill in accordance with the applicable specifications. Where affected materials exist to depths of 1.0 foot or less below proposed finished grade, remedial grading by moisture conditioning in-place, followed by thorough recompaction in accordance with the applicable grading guidelines herein may be attempted. If the desired results are not achieved, all affected materials should be overexcavated and replaced as compacted fill in accordance with the slope repair recommendations herein. If field conditions dictate, the geotechnical consultant may recommend other slope repair procedures.

#### Section 6 - Excavations

#### 6.1 Unsuitable Materials

Materials that are unsuitable should be excavated under observation and recommendations of the geotechnical consultant. Unsuitable materials include, but may not be limited to, dry, loose, soft, wet, organic compressible natural soils and fractured, weathered, soft bedrock and nonengineered or otherwise deleterious fill materials.

Material identified by the geotechnical consultant as unsatisfactory due to its moisture conditions should be overexcavated; moisture conditioned as needed, to a uniform at or above optimum moisture condition before placement as compacted fill.

If during the course of grading adverse geotechnical conditions are exposed which were not anticipated in the preliminary soil report as determined by the geotechnical consultant additional exploration, analysis, and treatment of these problems may be recommended.

#### 6.2 Cut Slopes

Unless otherwise recommended by the geotechnical consultant and approved by the regulating agencies, permanent cut slopes should not be steeper than 2:1 (horizontal: vertical).

The geotechnical consultant should observe cut slope excavation and if these excavations expose loose cohesionless, significantly fractured or otherwise unsuitable material, the materials should be overexcavated and replaced with a compacted stabilization fill. If encountered specific cross section details should be obtained from the Geotechnical Consultant.

When extensive cut slopes are excavated or these cut slopes are made in the direction of the prevailing drainage, a non-erodible diversion swale (brow ditch) should be provided at the top of the slope.

#### 6.3 Pad Areas

All lot pad areas, including side yard terrace containing both cut and fill materials, transitions, located less than 3 feet deep should be overexcavated to a depth of 3 feet and replaced with a uniform compacted fill blanket of 3 feet. Actual depth of overexcavation may vary and should be delineated by the geotechnical consultant during grading, especially where deep or drastic transitions are present.

For pad areas created above cut or natural slopes, positive drainage should be established away from the top-of-slope. This may be accomplished utilizing a berm drainage swale and/or an appropriate pad gradient. A gradient in soil areas away from the top-of-slopes of 2 percent or greater is recommended.

#### Section 7 - Compacted Fill

All fill materials should have fill quality, placement, conditioning and compaction as specified below or as approved by the geotechnical consultant.

#### 7.1 Fill Material Quality

Excavated on-site or import materials which are acceptable to the geotechnical consultant may be utilized as compacted fill, provided trash, vegetation and other deleterious materials are removed prior to placement. All import materials anticipated for use on-site should be sampled tested and approved prior to and placement is in conformance with the requirements outlined.

STANDARD SPECIFICATIONS OF GRADING Page 4 of 26 Rocks 12 inches in maximum and smaller may be utilized within compacted fill provided sufficient fill material is placed and thoroughly compacted over and around all rock to effectively fill rock voids. The amount of rock should not exceed 40 percent by dry weight passing the 3/4-inch sieve. The geotechnical consultant may vary those requirements as field conditions dictate.

Where rocks greater than 12 inches but less than four feet of maximum dimension are generated during grading, or otherwise desired to be placed within an engineered fill, special handling in accordance with the recommendations below. Rocks greater than four feet should be broken down or disposed off-site.

## 7.2 Placement of Fill

Prior to placement of fill material, the geotechnical consultant should observe and approve the area to receive fill. After observation and approval, the exposed ground surface should be scarified to a depth of 6 to 8 inches. The scarified material should be conditioned (i.e. moisture added or air dried by continued discing) to achieve a moisture content at or slightly above optimum moisture conditions and compacted to a minimum of 90 percent of the maximum density or as otherwise recommended in the soils report or by appropriate government agencies.

Compacted fill should then be placed in thin horizontal lifts not exceeding eight inches in loose thickness prior to compaction. Each lift should be moisture conditioned as needed, thoroughly blended to achieve a consistent moisture content at or slightly above optimum and thoroughly compacted by mechanical methods to a minimum of 90 percent of laboratory maximum dry density. Each lift should be treated in a like manner until the desired finished grades are achieved.

The contractor should have suitable and sufficient mechanical compaction equipment and watering apparatus on the job site to handle the amount of fill being placed in consideration of moisture retention properties of the materials and weather conditions.

When placing fill in horizontal lifts adjacent to areas sloping steeper than 5:1 (horizontal: vertical), horizontal keys and vertical benches should be excavated into the adjacent slope area. Keying and benching should be sufficient to provide at least six-foot wide benches and a minimum of four feet of vertical bench height within the firm natural ground, firm bedrock or engineered compacted fill. No compacted fill should be placed in an area after keying and benching until the geotechnical consultant has reviewed the area. Material generated by the benching operation should be moved sufficiently away from

the bench area to allow for the recommended review of the horizontal bench prior to placement of fill.

Within a single fill area where grading procedures dictate two or more separate fills, temporary slopes (false slopes) may be created. When placing fill adjacent to a false slope, benching should be conducted in the same manner as above described. At least a 3-foot vertical bench should be established within the firm core of adjacent approved compacted fill prior to placement of additional fill. Benching should proceed in at least 3-foot vertical increments until the desired finished grades are achieved.

Prior to placement of additional compacted fill following an overnight or other grading delay, the exposed surface or previously compacted fill should be processed by scarification, moisture conditioning as needed to at or slightly above optimum moisture content, thoroughly blended and recompacted to a minimum of 90 percent of laboratory maximum dry density. Where unsuitable materials exist to depths of greater than one foot, the unsuitable materials should be over-excavated.

Following a period of flooding, rainfall or overwatering by other means, no additional fill should be placed until damage assessments have been made and remedial grading performed as described herein.

Rocks 12 inch in maximum dimension and smaller may be utilized in the compacted fill provided the fill is placed and thoroughly compacted over and around all rock. No oversize material should be used within 3 feet of finished pad grade and within 1 foot of other compacted fill areas. Rocks 12 inches up to four feet maximum dimension should be placed below the upper 10 feet of any fill and should not be closer than 15 feet to any slope face. These recommendations could vary as locations of improvements dictate. Where practical, oversized material should not be placed below areas where structures or deep utilities are proposed. Oversized material should be placed in windrows on a clean, overexcavated or unyielding compacted fill or firm natural ground surface. Select native or imported granular soil (S.E. 30 or higher) should be placed and thoroughly flooded over and around all windrowed rock, such that voids are filled. Windrows of oversized material should be staggered so those successive strata of oversized material are not in the same vertical plane.

It may be possible to dispose of individual larger rock as field conditions dictate and as recommended by the geotechnical consultant at the time of placement.

STANDARD SPECIFICATIONS OF GRADING Page 6 of 26 The contractor should assist the geotechnical consultant and/or his representative by digging test pits for removal determinations and/or for testing compacted fill. The contractor should provide this work at no additional cost to the owner or contractor's client.

Fill should be tested by the geotechnical consultant for compliance with the recommended relative compaction and moisture conditions. Field density testing should conform to ASTM Method of Test D 1556-00, D 2922-04. Tests should be conducted at a minimum of approximately two vertical feet or approximately 1,000 to 2,000 cubic yards of fill placed. Actual test intervals may vary as field conditions dictate. Fill found not to be in conformance with the grading recommendations should be removed or otherwise handled as recommended by the geotechnical consultant.

### 7.3 Fill Slopes

Unless otherwise recommended by the geotechnical consultant and approved by the regulating agencies, permanent fill slopes should not be steeper than 2:1 (horizontal: vertical).

Except as specifically recommended in these grading guidelines compacted fill slopes should be over-built two to five feet and cut back to grade, exposing the firm, compacted fill inner core. The actual amount of overbuilding may vary as field conditions dictate. If the desired results are not achieved, the existing slopes should be overexcavated and reconstructed under the guidelines of the geotechnical consultant. The degree of overbuilding shall be increased until the desired compacted slope surface condition is achieved. Care should be taken by the contractor to provide thorough mechanical compaction to the outer edge of the overbuilt slope surface.

At the discretion of the geotechnical consultant, slope face compaction may be attempted by conventional construction procedures including backrolling. The procedure must create a firmly compacted material throughout the entire depth of the slope face to the surface of the previously compacted firm fill intercore.

During grading operations, care should be taken to extend compactive effort to the outer edge of the slope. Each lift should extend horizontally to the desired finished slope surface or more as needed to ultimately established desired grades. Grade during construction should not be allowed to roll off at the edge of the slope. It may be helpful to elevate slightly the outer edge of the slope. Slough resulting from the placement of individual lifts should not be allowed to drift down over previous lifts. At intervals not exceeding four feet in vertical slope height or the capability of available equipment, whichever is less, fill slopes should be thoroughly dozer trackrolled.

For pad areas above fill slopes, positive drainage should be established away from the top-of-slope. This may be accomplished using a berm and pad gradient of at least two percent.

## Section 8 - Trench Backfill

Utility and/or other excavation of trench backfill should, unless otherwise recommended, be compacted by mechanical means. Unless otherwise recommended, the degree of compaction should be a minimum of 90 percent of the laboratory maximum density.

Within slab areas, but outside the influence of foundations, trenches up to one foot wide and two feet deep may be backfilled with sand and consolidated by jetting, flooding or by mechanical means. If on-site materials are utilized, they should be wheel-rolled, tamped or otherwise compacted to a firm condition. For minor interior trenches, density testing may be deleted or spot testing may be elected if deemed necessary, based on review of backfill operations during construction.

If utility contractors indicate that it is undesirable to use compaction equipment in close proximity to a buried conduit, the contractor may elect the utilization of light weight mechanical compaction equipment and/or shading of the conduit with clean, granular material, which should be thoroughly jetted in-place above the conduit, prior to initiating mechanical compaction procedures. Other methods of utility trench compaction may also be appropriate, upon review of the geotechnical consultant at the time of construction.

In cases where clean granular materials are proposed for use in lieu of native materials or where flooding or jetting is proposed, the procedures should be considered subject to review by the geotechnical consultant. Clean granular backfill and/or bedding are not recommended in slope areas.

## Section 9 - Drainage

Where deemed appropriate by the geotechnical consultant, canyon subdrain systems should be installed in accordance with CTE's recommendations during grading.

Typical subdrains for compacted fill buttresses, slope stabilization or sidehill masses, should be installed in accordance with the specifications.

STANDARD SPECIFICATIONS OF GRADING Page 8 of 26 Roof, pad and slope drainage should be directed away from slopes and areas of structures to suitable disposal areas via non-erodible devices (i.e., gutters, downspouts, and concrete swales).

For drainage in extensively landscaped areas near structures, (i.e., within four feet) a minimum of 5 percent gradient away from the structure should be maintained. Pad drainage of at least 2 percent should be maintained over the remainder of the site.

Drainage patterns established at the time of fine grading should be maintained throughout the life of the project. Property owners should be made aware that altering drainage patterns could be detrimental to slope stability and foundation performance.

### Section 10 - Slope Maintenance

### 10.1 - Landscape Plants

To enhance surficial slope stability, slope planting should be accomplished at the completion of grading. Slope planting should consist of deep-rooting vegetation requiring little watering. Plants native to the southern California area and plants relative to native plants are generally desirable. Plants native to other semi-arid and arid areas may also be appropriate. A Landscape Architect should be the best party to consult regarding actual types of plants and planting configuration.

#### 10.2 - Irrigation

Irrigation pipes should be anchored to slope faces, not placed in trenches excavated into slope faces.

Slope irrigation should be minimized. If automatic timing devices are utilized on irrigation systems, provisions should be made for interrupting normal irrigation during periods of rainfall.

#### <u> 10.3 - Repair</u>

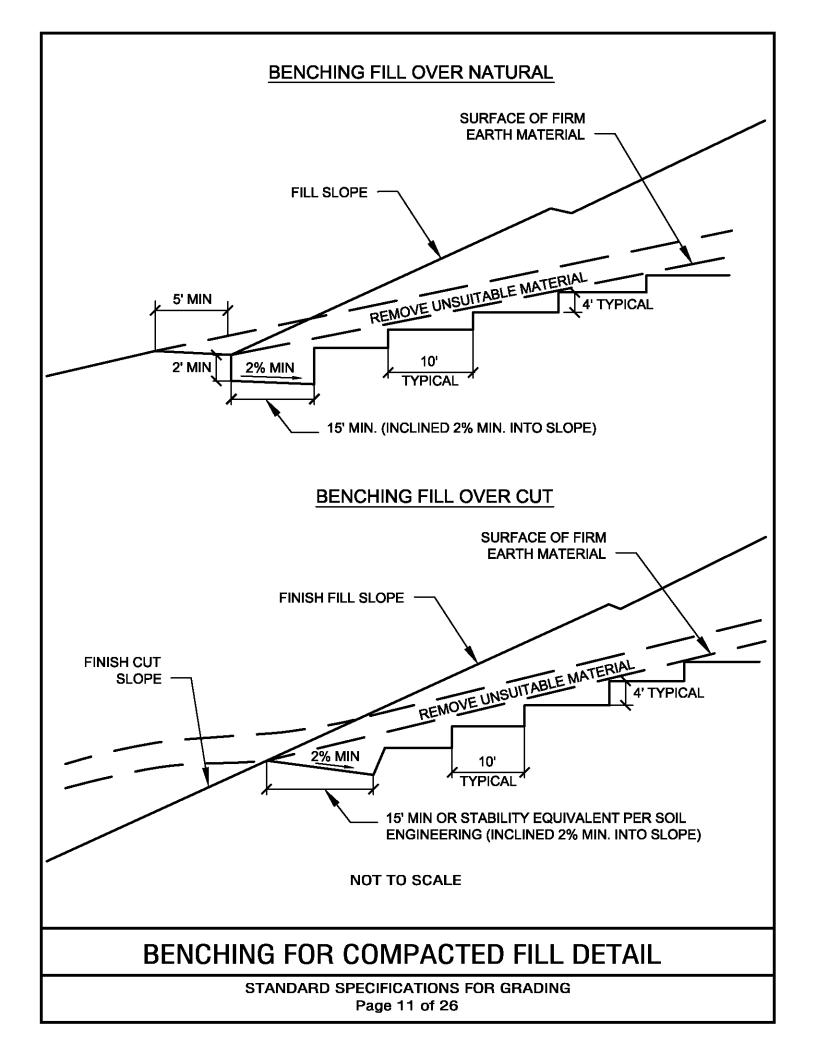

As a precautionary measure, plastic sheeting should be readily available, or kept on hand, to protect all slope areas from saturation by periods of heavy or prolonged rainfall. This measure is strongly recommended, beginning with the period prior to landscape planting.

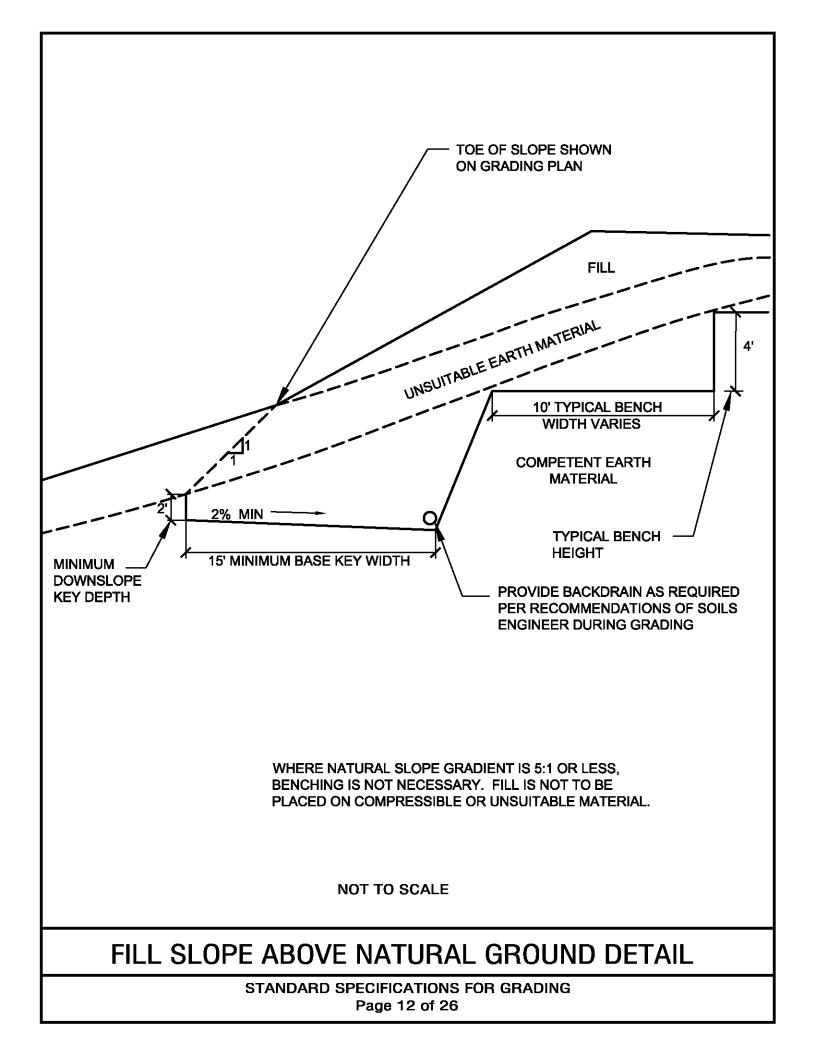

If slope failures occur, the geotechnical consultant should be contacted for a field review of site conditions and development of recommendations for evaluation and repair.

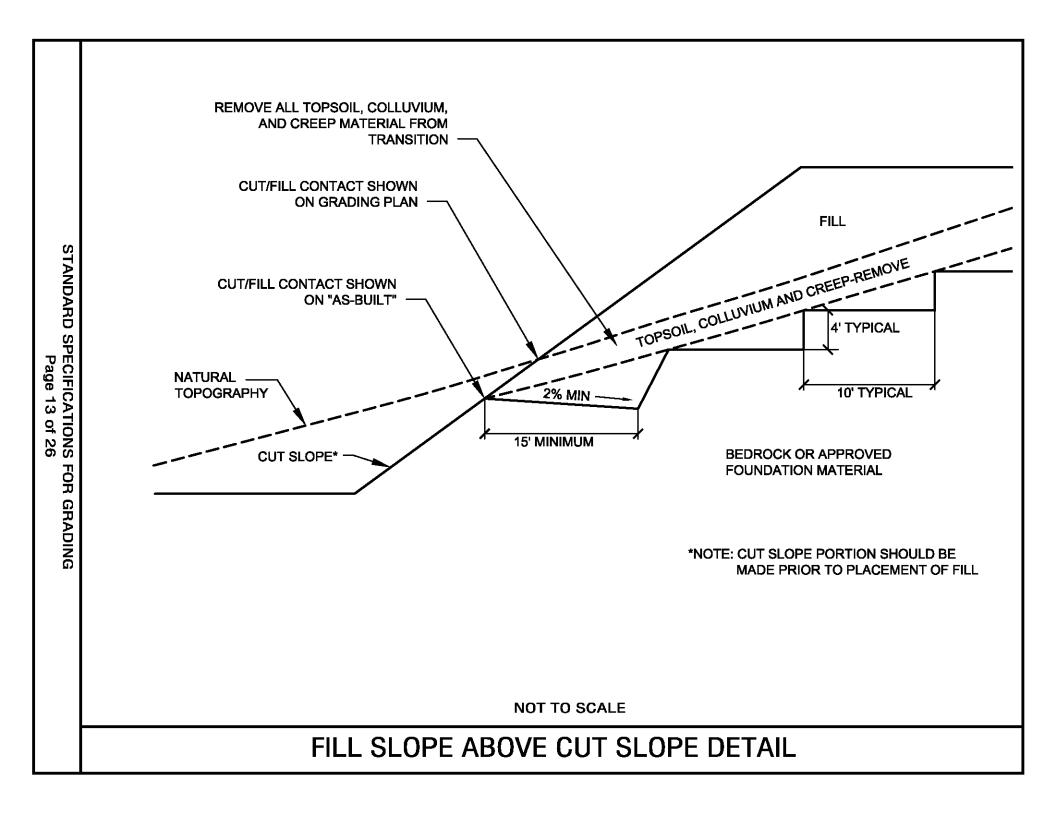

If slope failures occur as a result of exposure to period of heavy rainfall, the failure areas and currently unaffected areas should be covered with plastic sheeting to protect against additional saturation.

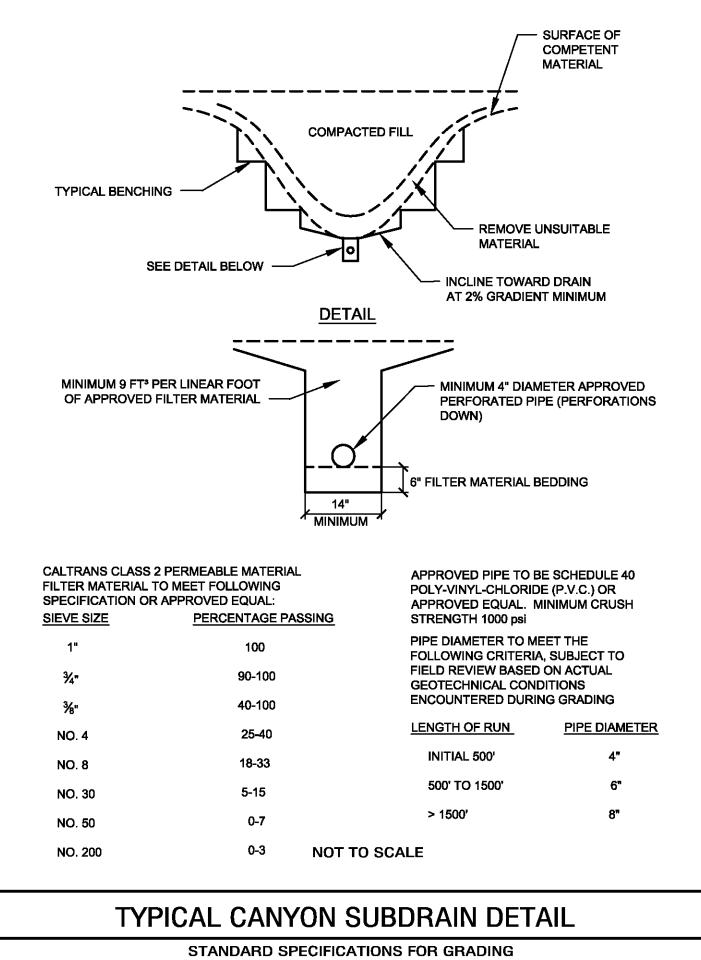

> STANDARD SPECIFICATIONS OF GRADING Page 9 of 26

In the accompanying Standard Details, appropriate repair procedures are illustrated for superficial slope failures (i.e., occurring typically within the outer one foot to three feet of a slope face).

# C.4-1 WORKSHEET

#### APPENDIX E

#### **Percolation Methodology**

Water used to conduct the tests was supplied from an onsite water source. Weather conditions during the test were hot and sunny during both the presoaking and testing days. The percolation testing methodology was determined following the presoak period per the San Diego County guidelines. In summary, Case I conditions are determined by water remaining overnight following an initial four-hour presoak. Case II is considered a fast draining soil in which two columns of 12-14 inches of water percolate in less than 30 minutes during the second presoak period that is conducted after a minimum of 15 hours of the initial presoak period. Case III conditions result when no water remains in the test hole 15-30 hours after the initial four-hour presoak, but does not meet Case II conditions during the second presoak period. The presoak duration for all of the recent tests ranged from approximately 23 to 24 hours, which is within the SD DEH 15 to 30 hour presoak range. The approximate percolation test and boring locations are presented on Figure 2. The associated boring logs are included in Appendix B. Results of the recent percolation testing are presented in Tables E-1 through E-7 below.

#### **Calculated Infiltration Rates**

As per the City of San Diego BMP Design Manuel (January, 2018) infiltration rates are to be evaluated through the Porchet Method. The intent of the infiltration rate is to take into account bias inherent in percolation test bore hole sidewall infiltration as would not occur at a basin bottom where such sidewalls are not present.

The infiltration rate (It) is derived by the equation:

#### $I_t = \Delta H \pi r 2.60 = \Delta H 60 r$

 $\Delta t(\pi r^2 + 2\pi r H_{avg})$   $\Delta t(r + 2H_{avg})$ 

#### Where:

- It = tested infiltration rate, inches/hour
- $\Delta H$  = change in head over the time interval, inches
- $\Delta t$  = time interval, minutes
- \* r = effective radius of test hole
- Havg = average head over the time interval, inches

#### Worksheet C.4-1: Categorization of Infiltration Feasibility Condition Based on Geotechnical Conditions<sup>9</sup>

<sup>&</sup>lt;sup>9</sup> Note that it is not required to investigate each and every criterion in the worksheet, a single "no" answer in Part 1, Part 2, Part 3, or Part 4 determines a full, partial, or no infiltration condition.
<sup>10</sup> This form must be completed each time there is a change to the site layout that would affect the infiltration feasibility condition. Previously completed forms shall be retained to document the evolution of the site storm water design.

<sup>&</sup>lt;sup>11</sup> Available data includes site-specific sampling or observation of soil types or texture classes, such as obtained from borings or test pits necessary to support other design elements.

| Criteria 1<br>Result | inches per hour within the DMA<br>atinue to Criteria 2.<br>t.   |  |  |  |  |  |

Summarize infiltration testing methods, testing locations, replicates, and results and summarize estimates of reliable infiltration rates according to procedures outlined in D.5. Documentation should be included in project geotechnical report.

As the project development is in initial design phase, specific potential BMP locations have not been finalized. As such, we conducted percolation test borings such that the entire site would be accurately characterized in terms of infiltration potential. Borehole percolation tests were completed in accordance with Couty of San Diego Department of Environmental Health (DEH), Version 2010 guidelines. The derived percolation rates were then converted to infiltration rates following the procedures of the Prochet Method, as recommended by the BMP Design Manual, Appendix D (February, 2018). In total, seven percolation tests borings were advanced over the subject site. All percolation tests met Case 1 criteria, and were converted to infiltration rates. All infiltation rates were below the lower boundary rate for partial infiltration prior to appling a Safety factor of two to the results. As such, the site is classified as a "No Infiltration Condition" based on Class D type NCRS soil types that were confiremd by logs of borings and infiltration rates below 0.05 inches per hour.

However, there were no other geologic-geotechnical conditions with managable mitigation levels that would prohibited infiltration provided conformance with all structural setback criteria as defined in Appendix C of the City of San Diego BMP Design Manuel (January 2018) is ahered to. With the possible exception of expansive soils with Expansion Index values greater than 20.

Summarize findings and basis; provide references to related reports or exhibits.

As discussed in the Geotechnical Preliminary Report, dated April 23, 2018 (attached), the site is classified as "No Infiltration condition base on NCRS soil type D and low infiltration rates below 0.05 inches per hour. However, there are no other geologic - geotechnical conditions that are considered non feasible for infiltration provided reasonable mitigation measures are employed and structural setback criteria are adhered to. With the possible exception of expansive soils with Expansion Index values greater than 20.

As the project development is in initial design phase, specific potential BMP locations have not been finalized. As such, we conducted percolation test borings such that the entire site would be accurately characterized in terms of infiltration potential. Borehole percolation tests were completed in accordance with County of San Diego Department of Environmental Health (DEH), Version 2010 guidelines. The derived percolation rates were then converted to infiltration rates following the procedures of the Prochet Method, as recommended by the BMP Design Manual, Appendix D (February, 2018). In total, seven percolation test borings were advanced over the subject site. All percolation tests met Case 1 criteria, and were converted to infiltration rates. All infiltation rates were below the lower boundary rate for partial infiltration prior to appling a Safety factor of two to the results. As such, the site is classified as a "No Infiltration Condition" based on Class D type NCRS soil types that were confiremd by logs of borings and infiltration rates below 0.05 inches per hour.

### I. Project Description

#### i. Background

The subject site is bound on the north by Aero Drive, on the south by existing residential, on the west and east by shared driveway and existing office complexes. Refer to the vicinity map in Appendix "A". The proposed project includes interior modifications and additions to the existing building and conversion of a portion of existing surface parking to parking structure, as well as private storm drain improvements for water quality and hydromodification management purposes.

The purpose of this drainage study is to quantify the existing and post-project drainage conditions to support grading and storm drain design for the Project, and to confirm that the project will not adversely affect existing offsite drainage infrastructure. Adverse effects to offsite drainage infrastructure can be avoided by limiting project condition peak flows to equal, or less than, existing condition peak flows. Storm water quality and hydromodification management plan (HMP) compliance is detailed in a separate document, the Storm Water Quality Management Plan (SWQMP).

The project does not include work within any wetland, stream, lake, pond, or any other waters regulated by the state, and is not anticipated to require Clean Water Act Section 404 or 401 permit or certification.

#### ii. Existing Condition

The existing site consists of a relatively level, rectangular-shaped property that presently supports the existing buildings and surface parking. The site drains via surface sheet flow to three discharge points.

Watershed A (Discharge Node 100): Runoff from the west portion of the site surface flows into the west driveway, as well as north into Aero Drive through curb cuts on the west side of a high point in Aero Drive. Surface flow is conveyed west, approx. 2,000 feet to catch basins just west of Afton Road. A 60" storm drain conveys water to a concrete-lined open channel that parallels the east edge of Interstate 805 before passing under to a natural channel. The natural channel flows south to a storm drain facility that conveys water into the San Diego River at approximately Mission Center Road.

Watershed B (Discharge Node 200): Runoff from the central and northeast portion of the site surface flows into Aero Drive through curb cuts and out of a driveway on the east side of a high point in Aero Drive. Surface flow is conveyed 1,200 feet east to a catch basin that discharges into an unnamed natural channel. Flow in the natural channel is conveyed under developments via storm drain and into the San Diego River at Interstate 805.

Watershed C (Discharge Node 300): Runoff from the southeast portion of the site drains through the existing wall located in the south east corner of the property and into the gutter of Ediwhar Avenue. Surface flow is conveyed into catch basins located about 2,000 feet south and east in Hammond Drive. Storm drains convey flow into the same unnamed natural channel. Flow in the natural channel is conveyed under developments via storm drain and into the San Diego River at approx. Interstate 805.

The San Diego River discharges to the Pacific Ocean just south of Mission Bay. There is no run-on to the site from adjacent properties. The existing condition hydrology map can be found in Appendix "G".

#### iii. Proposed Condition

The proposed site will be designed to maintain existing condition drainage patterns to the maximum extent practical. Runoff from the parking structure top level will sheet flow into the existing parking lots as in the existing condition. The parking structure straddles the site high point that divides watersheds A and B. Approximately half of the proposed parking structure will drain to Node 100 and the rest will drain to Node 200. The portion of the structure draining to Node 100 will not be captured in a water quality Best Management Practice (BMP). To compensate, an equivalent area of existing parking lot and

architecture | planning | interiors | branding | civil

building roof is included in water quality sizing and hydromodification flow controls at Discharge Node 200 (Point of Connection 1). These calculations are shown and explained in detail in the SWQMP.

Watershed B includes the additions to the existing building, as well as landscape and surface parking improvements. Drainage from these improvements will be conveyed via sheet flow into Biofiltration with Underdrain BMPs and into the hydromodification flow control detention BMP. The detention BMP will include an outlet structure with pump so that water can be discharged to street level as in the existing condition in compliance with HMP requirements, detailed in the SWQMP document. HMP requirements address storms up to the 10-year storm event. Flow in excess of the HMP compliance storm will overflow and/or bypass project BMPs and surface drain into Aero Drive, as in the existing condition.

Limited changes to Watershed C are anticipated as a result of the project. Landscaping will replace some surface parking area along the south edge of the existing building.

#### iv. Design Criteria and Methods

The rational method hydrologic model was used to determine the 100-year, 6-hour and 24-hr storm event peak flows in both the existing and project conditions for comparison. Computation criteria found in the City of San Diego Drainage Design Manual January 2017 Edition was used in Advanced Engineering Software (AES) 2016 calculations.

architecture | planning | interiors | branding | civil

### II. Hydrology Analysis

#### i. Rational Method Peak Flows

The existing and proposed condition hydrology maps provided in this report show the sub-areas used to generate flows for the site. The variables taken into consideration in the computation include rainfall, impervious percent, and land use conditions characteristics of flow conveyance, and time of concentration.

The soils map included in Appendix B indicates type D soils. Figure B-2 from the Manual shows that the 100-year 6-hour rainfall is 2.5 inches, included in Appendix C. Figure B-3 from the Manual shows that the 100-year 6-hour rainfall is 4 inches, included in Appendix D. The Antecedent Moisture Condition for the 100-year storm used is two. Runoff coefficients given in Table A-1 of the Manual were revised based on actual impervious percentages in the existing and project condition as shown in the tables below:

|          | EXISTING CONDITION |                |            |            |          |   | PROPOSED CONDITION |           |                |            |            |          |

The Rational Method via AES Hydrologic software derived the following flow rates for the existing and postdeveloped condition (see Appendix "E" and "F" for a detailed tabulation):

### III. Conclusion

Project condition calculations are conservative because they do not account for the storage and flood routing provided by project BMPs. Project improvements include an increase in pervious areas onsite, adding landscaping and biofiltration BMPs where surface parking exists today. As a result, project impacts decrease the amount of discharge expected at each discharge point, as well as in total, when compared to the existing condition. Therefore, no adverse impacts to offsite drainage infrastructure is anticipated.

Water quality and hydromodification flow control BMPs will be implemented to satisfy the requirements of the Natioanl Pollutant Discharge Elimination System (NPDES) permit locally regulated by San Diego Regional MS4 Permit (order R9-2013-0001), reissued by California Regional Water Quality Control Board (SDRWQCB) in May 2013 and amended by Order R9-2015-0001 and R9-2015-0100 and as demonstrated in the SWQMP.

#### **Project Name:**

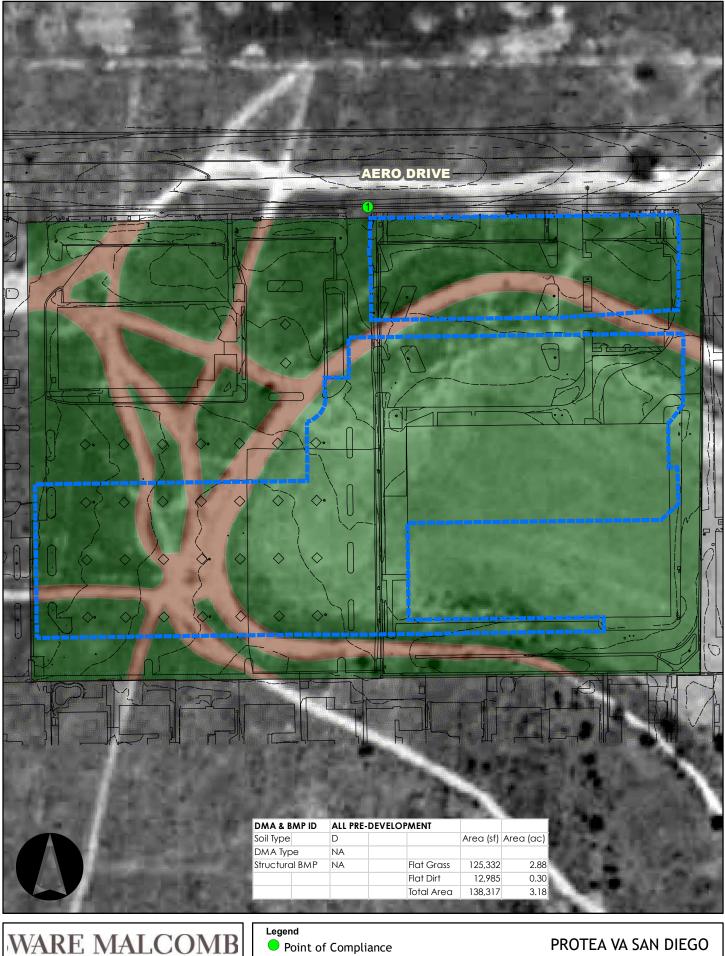

### Use this checklist to ensure the required information has been included on the Hydromodification Management Exhibit:

The Hydromodification Management Exhibit must identify:

| Underlying hydrologic soil group  |
|---|
| Approximate depth to groundwater  |
| Existing natural hydrologic features (watercourses, seeps, springs, wetlands)         |
| Critical coarse sediment yield areas to be protected OR provide a separate map        |
| showing that the project site is outside of any critical coarse sediment yield areas  |
| Existing topography   |
| Existing and proposed site drainage network and connections to drainage offsite       |
| Proposed grading  |
| Proposed impervious features  |
| Proposed design features and surface treatments used to minimize imperviousness       |
| Point(s) of Compliance (POC) for Hydromodification Management                         |
| Existing and proposed drainage boundary and drainage area to each POC (when           |
| necessary, create separate exhibits for pre-development and post-project              |
| conditions)   |
| Structural BMPs for hydromodification management (identify location, type of BMP, and |
| size/detail).   |

## **SDHM 3.1**

## **PROJECT REPORT**

#### Notes:

1. Pumped discharge was modeled using the Stage Storage Discharge element:

- The ADS StormTech Chamber system was sized in a separate model and the SSD table was exported and modified to add a constant pump rate of 0.06 cfs, which is less than the 0.1Q2.

2. Both USGS regression equations and SDHM3.1 methodology was used to check Q2 and Q10. USGS Regression equations resulted in larger flows, therefore SDHM3.1 is set to check 0.1Q2 using Regression Equation flow ranges:

|                     | US   | GS REGR   | ESSION EQUATION CHE     | CK       |          | SDHM3.1 RESULTS   |

Did you specify any "special actions"? If so, they could account for it. Relevant data are: DATE/TIME: 1998/ 4/30 24: 0 RCHRES : 3 RELERR STORS STOR MATIN MATDIF 0.00000 0.0000E+00 -5.121E-03 0.00000 6.2256E-12

Where:

RELERR is the relative error (ERROR/REFVAL). ERROR is (STOR-STORS) - MATDIF. REFVAL is the reference value (STORS+MATIN). STOR is the storage of material in the processing unit (land-segment or reach/reservior) at the end of the present interval. STORS is the storage of material in the pu at the start of the present printout reporting period. MATIN is the total inflow of material to the pu during the present printout reporting period. MATDIF is the net inflow (inflow-outflow) of material to the pu during the present printout reporting period.

| Attachment<br>Sequence | Contents  | Checklist   |  |  |
|------------------------|---|---|--|--|
| Attachment 3           | Maintenance Agreement (Form<br>DS-3247) (when applicable) | <ul><li>Included</li><li>Not applicable</li></ul> |  |  |

#### Use this checklist to ensure the required information has been included in the Structural BMP Maintenance Information Attachment:

**Attachment 3**: For private entity operation and maintenance, Attachment 3 must include a Storm Water Management and Discharge Control Maintenance Agreement (Form DS-3247). The following information must be included in the exhibits attached to the maintenance agreement:

- - Site design BMPs for which DCV reduction is claimed for meeting the pollutant control obligations.
- BMP and HMP location and dimensions
- BMP and HMP specifications/cross section/model
- Maintenance recommendations and frequency
- LID features such as (permeable paver and LS location, dim, SF).

RECORDING REQUESTED BY: THE CITY OF SAN DIEGO AND WHEN RECORDED MAIL TO:

(THIS SPACE IS FOR RECORDER'S USE ONLY)

#### STORM WATER MANAGEMENT AND DISCHARGE CONTROL MAINTENANCE AGREEMENT

APPROVAL NUMBER:

ASSESSORS PARCEL NUMBER:

PROJECT NUMBER:

This agreement is made by and between the City of San Diego, a municipal corporation [City] and \_\_\_\_\_

the owner or duly authorized representative of the owner [Property Owner] of property located at

(PROPERTY ADDRESS)

and more particularly described as: \_\_\_\_\_

(LEGAL DESCRIPTION OF PROPERTY)

in the City of San Diego, County of San Diego, State of California.

Property Owner is required pursuant to the City of San Diego Municipal Code, Chapter 4, Article 3, Division 3, Chapter 14, Article 2, Division 2, and the Land Development Manual, Storm Water Standards to enter into a Storm Water Management and Discharge Control Maintenance Agreement [Maintenance Agreement] for the installation and maintenance of Permanent Storm Water Best Management Practices [Permanent Storm Water BMP's] prior to the issuance of construction permits. The Maintenance Agreement is intended to ensure the establishment and maintenance of Permanent Storm Water BMP's onsite, as described in the attached exhibit(s), the project's Storm Water Quality Management Plan [SWQMP] and Grading and/or Improvement Plan Drawing No(s), or Building Plan Project No(s): \_\_\_\_\_\_.

Property Owner wishes to obtain a building or engineering permit according to the Grading and/or Improvement Plan Drawing No(s) or Building Plan Project No(s): \_\_\_\_\_\_.

**Continued on Page 2** 

NOW, THEREFORE, the parties agree as follows:

- 1. Property Owner shall have prepared, or if qualified, shall prepare an Operation and Maintenance Procedure [OMP] for Permanent Storm Water BMP's, satisfactory to the City, according to the attached exhibit(s), consistent with the Grading and/or Improvement Plan Drawing No(s), or Building Plan Project No(s): \_\_\_\_\_\_.
- 2. Property Owner shall install, maintain and repair or replace all Permanent Storm Water BMP's within their property, according to the OMP guidelines as described in the attached exhibit(s), the project's SWQMP and Grading and/or Improvement Plan Drawing No(s), or Building Plan Project No(s) \_\_\_\_\_\_.
- 3. Property Owner shall maintain operation and maintenance records for at least five (5) years. These records shall be made available to the City for inspection upon request at any time.

This Maintenance Agreement shall commence upon execution of this document by all parties named hereon, and shall run with the land.

Executed by the City of San Diego and by Property Owner in San Diego, California.

See Attached Exhibit(s): \_\_\_\_\_

#### STORMTECH CHAMBER SPECIFICATIONS

- CHAMBERS SHALL BE STORMTECH MC-4500 OR APPROVED EQUAL. 1.
- CHAMBERS SHALL BE MANUFACTURED FROM VIRGIN, IMPACT-MODIFIED POLYPROPYLENE COPOLYMERS. 2.
- CHAMBER ROWS SHALL PROVIDE CONTINUOUS, UNOBSTRUCTED INTERNAL SPACE WITH NO INTERNAL SUPPORT PANELS THAT З. WOULD IMPEDE FLOW OR LIMIT ACCESS FOR INSPECTION.
- THE STRUCTURAL DESIGN OF THE CHAMBERS, THE STRUCTURAL BACKFILL, AND THE INSTALLATION REQUIREMENTS SHALL ENSURE THAT THE LOAD FACTORS SPECIFIED IN THE AASHTO LRFD BRIDGE DESIGN SPECIFICATIONS, SECTION 12.12, ARE MET FOR: 1) LONG-DURATION DEAD LOADS AND 2) SHORT-DURATION LIVE LOADS, BASED ON THE AASHTO DESIGN TRUCK WITH CONSIDERATION FOR IMPACT AND MULTIPLE VEHICLE PRESENCES.
- CHAMBERS SHALL MEET THE REQUIREMENTS OF ASTM F2418, "STANDARD SPECIFICATION FOR POLYPROPYLENE (PP) CORRUGATED 5 WALL STORMWATER COLLECTION CHAMBERS".
- CHAMBERS SHALL BE DESIGNED AND ALLOWABLE LOADS DETERMINED IN ACCORDANCE WITH ASTM F2787, "STANDARD PRACTICE FOR STRUCTURAL DESIGN OF THERMOPLASTIC CORRUGATED WALL STORMWATER COLLECTION CHAMBERS".
- 7. ONLY CHAMBERS THAT ARE APPROVED BY THE SITE DESIGN ENGINEER WILL BE ALLOWED. THE CHAMBER MANUFACTURER SHALL SUBMIT THE FOLLOWING UPON REQUEST TO THE SITE DESIGN ENGINEER FOR APPROVAL BEFORE DELIVERING CHAMBERS TO THE PROJECT SITE:
  - A STRUCTURAL EVALUATION SEALED BY A REGISTERED PROFESSIONAL ENGINEER THAT DEMONSTRATES THAT THE SAFETY FACTORS ARE GREATER THAN OR EQUAL TO 1.95 FOR DEAD LOAD AND 1.75 FOR LIVE LOAD, THE MINIMUM REQUIRED BY ASTM F2787 AND BY AASHTO FOR THERMOPLASTIC PIPE.
  - A STRUCTURAL EVALUATION SEALED BY A REGISTERED PROFESSIONAL ENGINEER THAT DEMONSTRATES THAT THE LOAD b. FACTORS SPECIFIED IN THE AASHTO LRFD BRIDGE DESIGN SPECIFICATIONS, SECTION 12.12, ARE MET. THE 50 YEAR CREEP MODULUS DATA SPECIFIED IN ASTM F2418 MUST BE USED AS PART OF THE AASHTO STRUCTURAL EVALUATION TO VERIFY LONG-TERM PERFORMANCE.
  - STRUCTURAL CROSS SECTION DETAIL ON WHICH THE STRUCTURAL EVALUATION IS BASED. C.
- CHAMBERS AND END CAPS SHALL BE PRODUCED AT AN ISO 9001 CERTIFIED MANUFACTURING FACILITY.

#### **IMPORTANT - NOTES FOR THE BIDDING AND INSTALLATION OF MC-4500 CHAMBER SYSTEM**

- STORMTECH MC-4500 CHAMBERS SHALL NOT BE INSTALLED UNTIL THE MANUFACTURER'S REPRESENTITIVE HAS COMPLETED A 1 PRE-CONSTRUCTION MEETING WITH THE INSTALLERS.
- 2 STORMTECH MC-4500 CHAMBERS SHALL BE INSTALLED IN ACCORDANCE WITH THE "STORMTECH MC-3500/MC-4500 CONSTRUCTION GUIDE".
- CHAMBERS ARE NOT TO BE BACKFILLED WITH A DOZER OR EXCAVATOR SITUATED OVER THE CHAMBERS. 3.

STORMTECH RECOMMENDS 3 BACKFILL METHODS:

- STONESHOOTER LOCATED OFF THE CHAMBER BED.
  - BACKFILL FROM OUTSIDE THE EXCAVATION USING A LONG BOOM HOE OR EXCAVATOR.
- THE FOUNDATION STONE SHALL BE LEVELED AND COMPACTED PRIOR TO PLACING CHAMBERS. 4.
- JOINTS BETWEEN CHAMBERS SHALL BE PROPERLY SEATED PRIOR TO PLACING STONE. 5.
- 6. MAINTAIN MINIMUM - 9" (230 mm) SPACING BETWEEN THE CHAMBER ROWS.
- INLET AND OUTLET MANIFOLDS MUST BE INSERTED A MINIMUM OF 12" (300 mm) INTO CHAMBER END CAPS. 7.
- EMBEDMENT STONE SURROUNDING CHAMBERS MUST BE A CLEAN, CRUSHED, ANGULAR STONE 3/4-2" (20-50 mm) MEETING THE AASHTO M43 8. DESIGNATION OF #3 OR #4.
- 9. BY MORE THAN 12" (300 mm) BETWEEN ADJACENT CHAMBER ROWS.
- 10. STONE MUST BE PLACED ON THE TOP CENTER OF THE CHAMBER TO ANCHOR THE CHAMBERS IN PLACE AND PRESERVE ROW SPACING.
- ADS RECOMMENDS THE USE OF "FLEXSTORM CATCH IT" INSERTS DURING CONSTRUCTION FOR ALL INLETS TO PROTECT THE SUBSURFACE 11. STORMWATER MANAGEMENT SYSTEM FROM CONSTRUCTION SITE RUNOFF.

#### NOTES FOR CONSTRUCTION EQUIPMENT

- 1.
- 2. THE USE OF EQUIPMENT OVER MC-4500 CHAMBERS IS LIMITED:
  - NO EQUIPMENT IS ALLOWED ON BARE CHAMBERS.
    - WITH THE "STORMTECH MC-3500/MC-4500 CONSTRUCTION GUIDE".
- 3. FULL 36" (900 mm) OF STABILIZED COVER MATERIALS OVER THE CHAMBERS IS REQUIRED FOR DUMP TRUCK TRAVEL OR DUMPING.

USE OF A DOZER TO PUSH EMBEDMENT STONE BETWEEN THE ROWS OF CHAMBERS MAY CAUSE DAMAGE TO CHAMBERS AND IS NOT AN ACCEPTABLE BACKFILL METHOD. ANY CHAMBERS DAMAGED BY USING THE "DUMP AND PUSH" METHOD ARE NOT COVERED UNDER THE STORMTECH STANDARD WARRANTY.

BACKFILL AS ROWS ARE BUILT USING AN EXCAVATOR ON THE FOUNDATION STONE OR SUBGRADE.

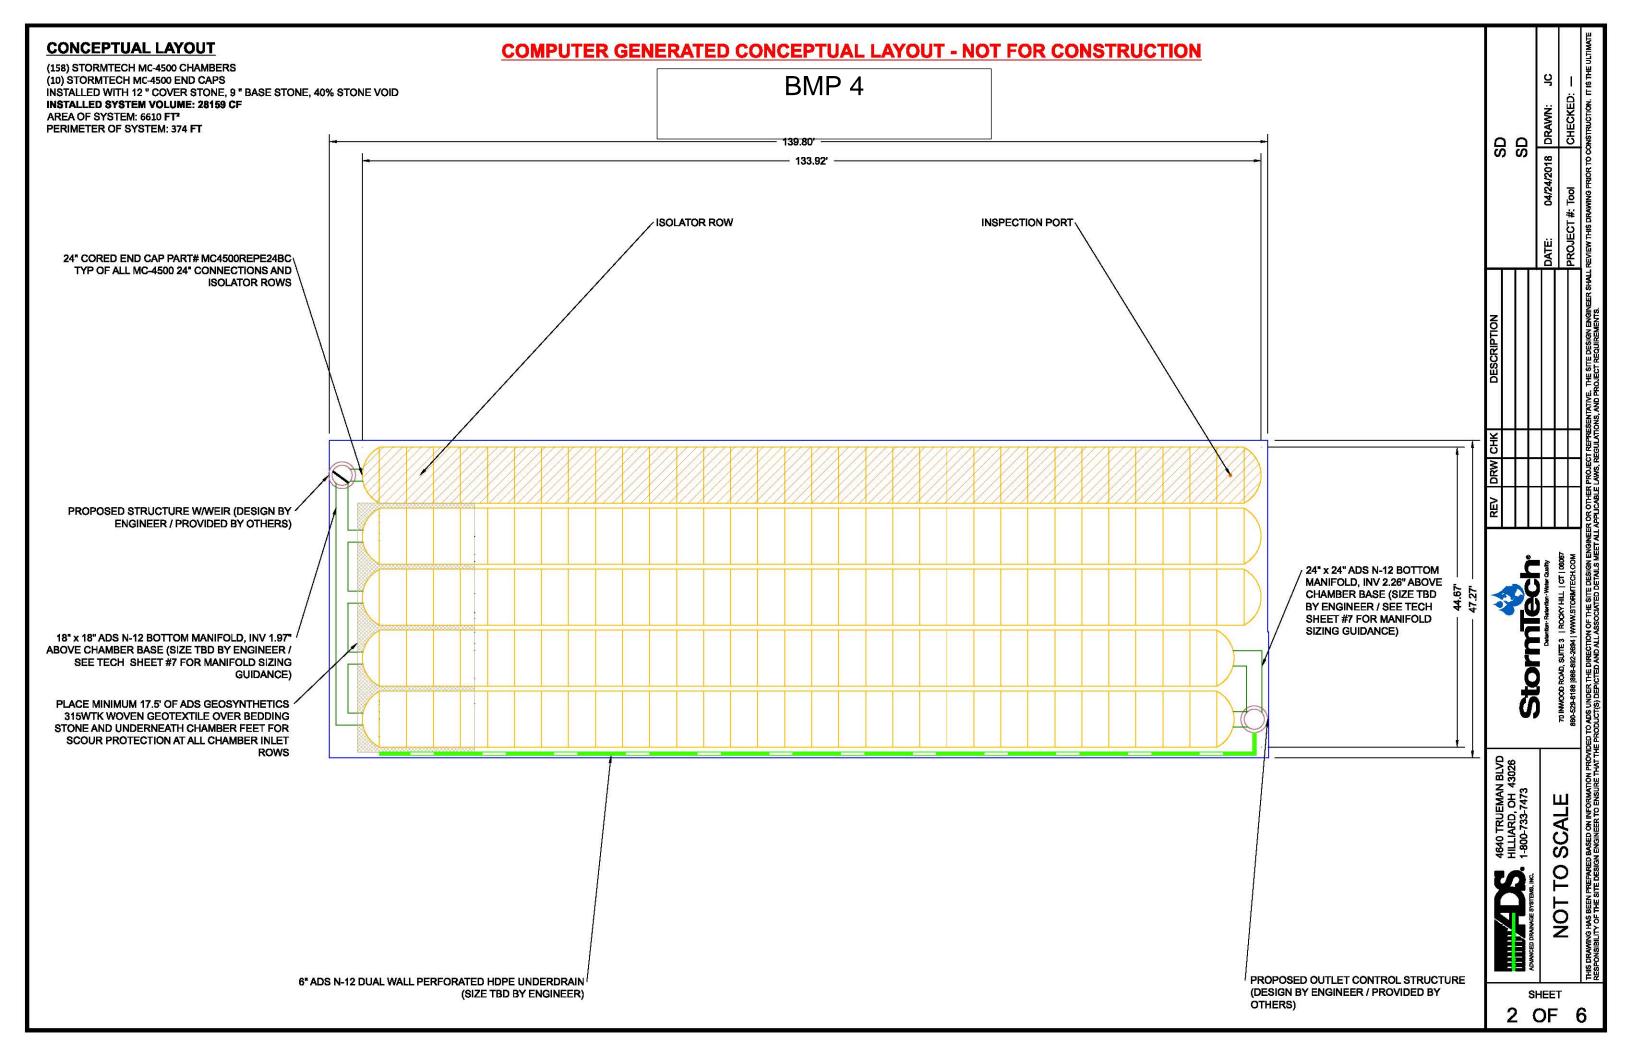

STONE SHALL BE BROUGHT UP EVENLY AROUND CHAMBERS SO AS NOT TO DISTORT THE CHAMBER SHAPE. STONE DEPTHS SHOULD NEVER DIFFER

STORMTECH MC-4500 CHAMBERS SHALL BE INSTALLED IN ACCORDANCE WITH THE "STORMTECH MC-3500/MC-4500 CONSTRUCTION GUIDE".

NO RUBBER TIRED LOADER, DUMP TRUCK, OR EXCAVATORS ARE ALLOWED UNTIL PROPER FILL DEPTHS ARE REACHED IN ACCORDANCE

WEIGHT LIMITS FOR CONSRUCTION EQUIPMENT CAN BE FOUND IN THE "STORMTECH MC-3500/MC-4500 CONSTRUCTION GUIDE".

CONTACT STORMTECH AT 1-888-892-2694 WITH ANY QUESTIONS ON INSTALLATION REQUIREMENTS OR WEIGHT LIMITS FOR CONSTRUCTION EQUIPMENT.

PLEASE NOTE:

1. THE LISTED AASHTO DESIGNATIONS ARE FOR GRADATIONS ONLY. THE STONE MUST ALSO BE CLEAN, CRUSHED, ANGULAR. FOR EXAMPLE, A SPECIFICATION FOR #4 STONE WOULD STATE: "CLEAN, CRUSHED, ANGULAR NO. 4 (AASHTO M43) STONE".

2. STORMTECH COMPACTION REQUIREMENTS ARE MET FOR 'A' LOCATION MATERIALS WHEN PLACED AND COMPACTED IN 9" (230 mm) (MAX) LIFTS USING TWO FULL COVERAGES WITH A VIBRATORY COMPA

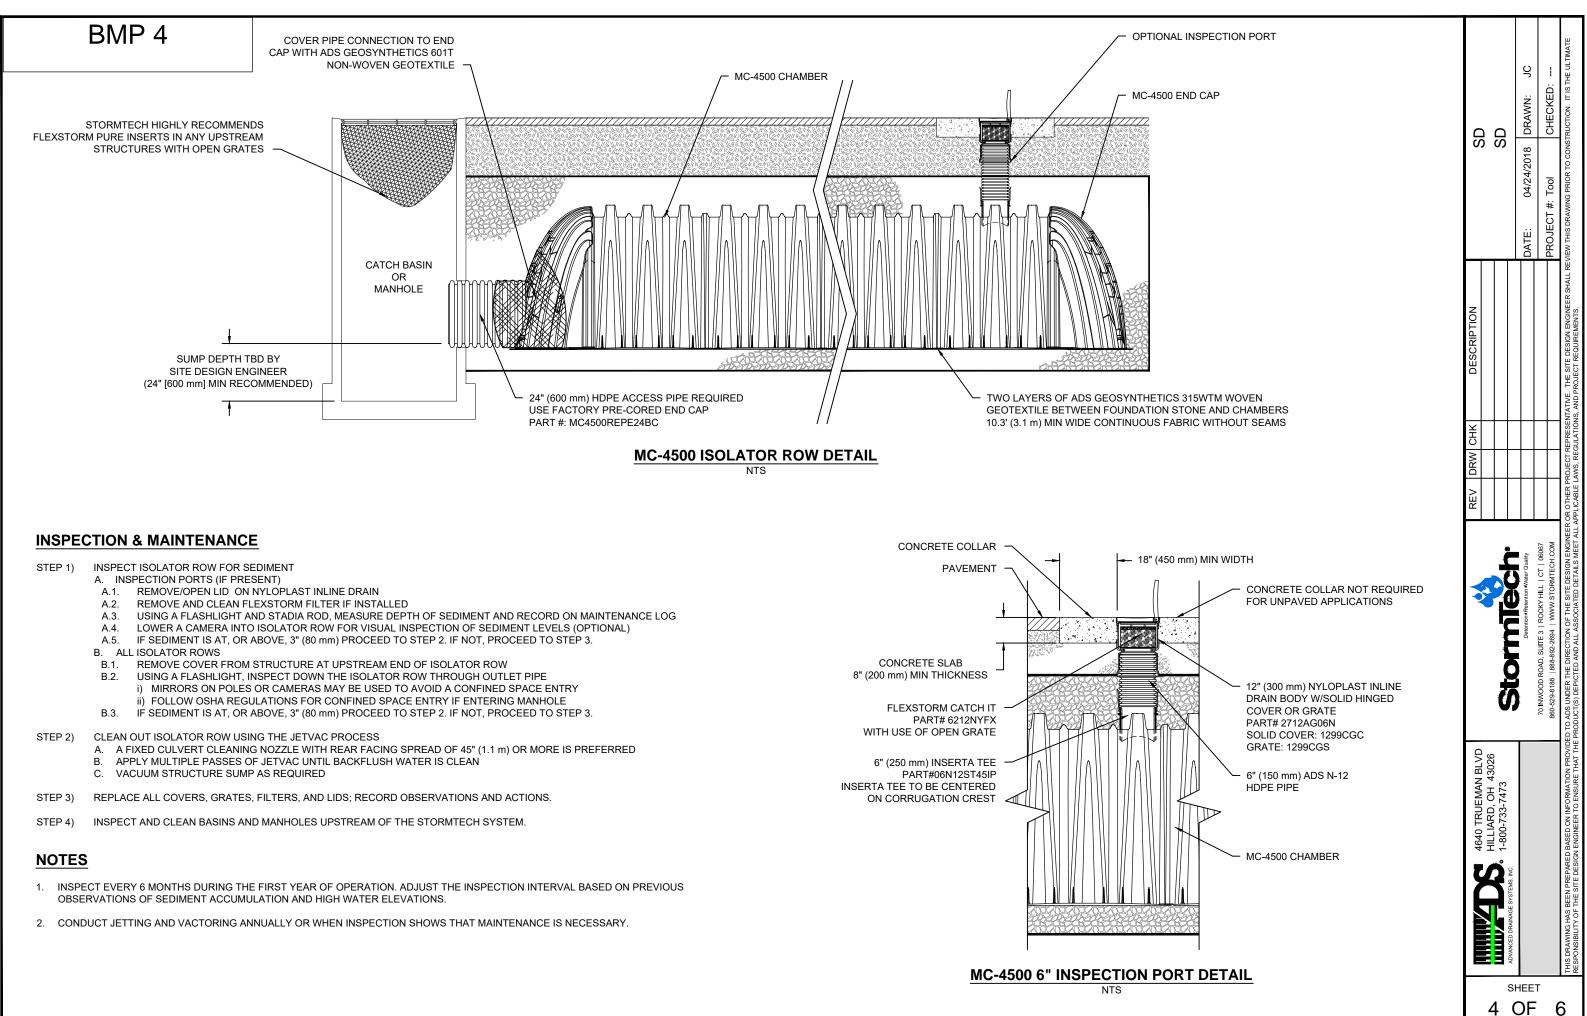

3. WHERE INFILTRATION SURFACES MAY BE COMPROMISED BY COMPACTION, FOR STANDARD DESIGN LOAD CONDITIONS, A FLAT SURFACE MAY BE ACHIEVED BY RAKING OR DRAGGING WITHOUT COMPA EQUIPMENT. FOR SPECIAL LOAD DESIGNS, CONTACT STORMTECH FOR COMPACTION REQUIREMENTS.

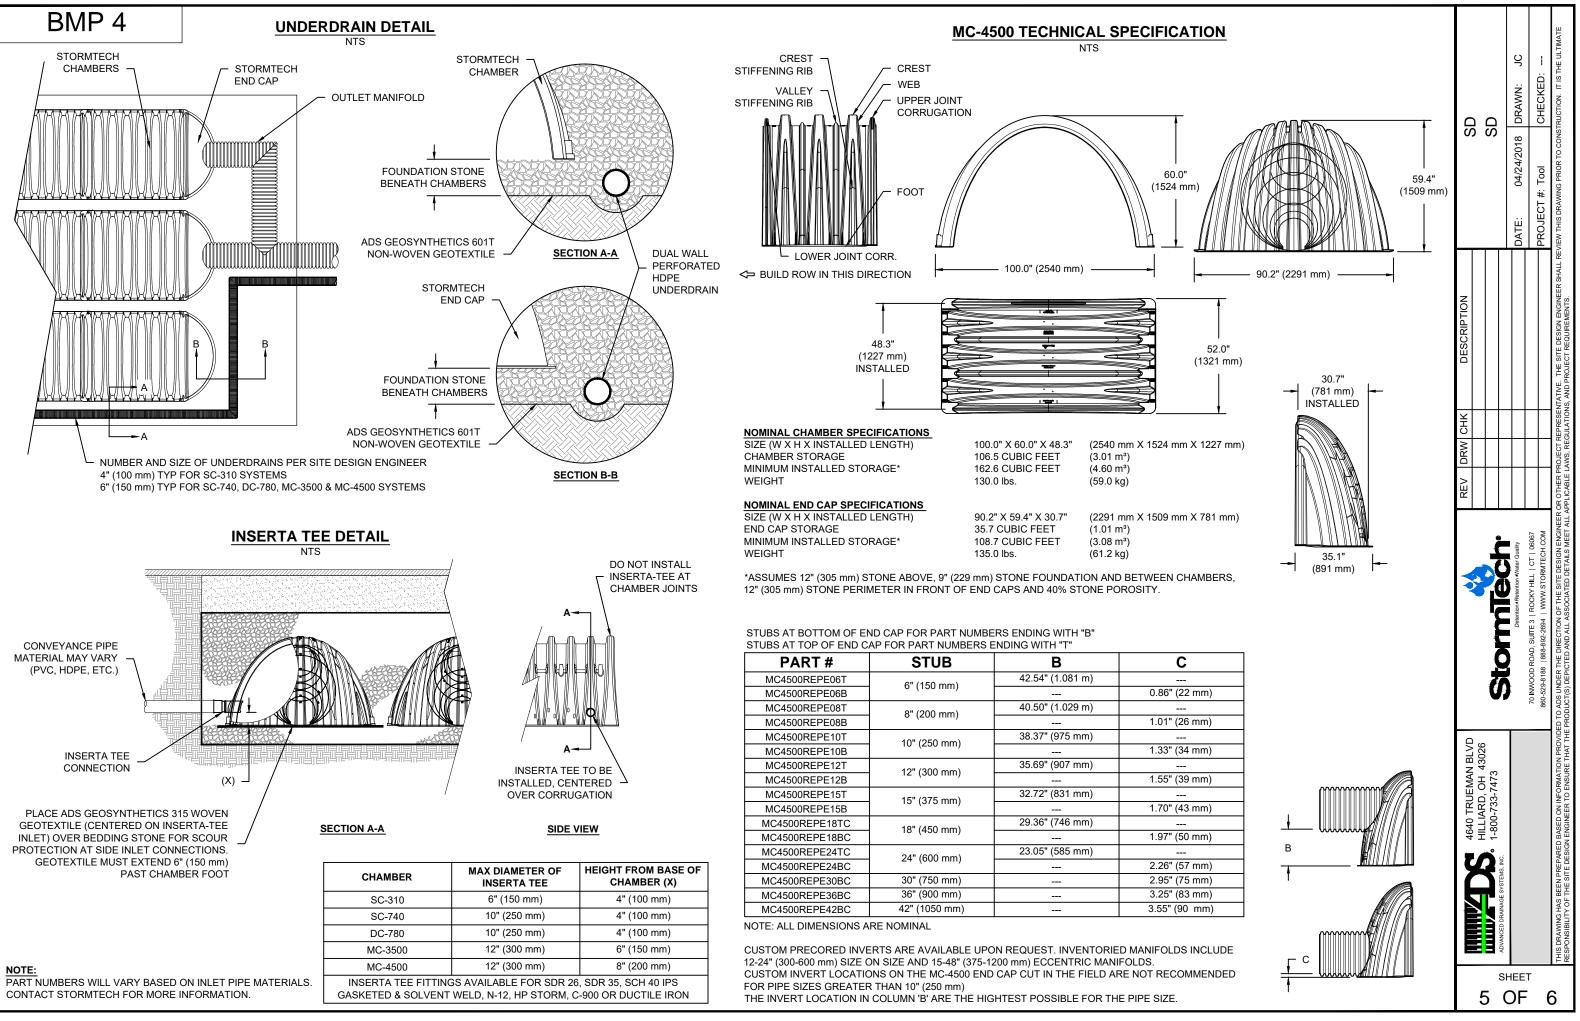

## NOTES:

- 1. MC-4500 CHAMBERS SHALL CONFORM TO THE REQUIREMENTS OF ASTM F2418 "STANDARD SPECIFICATION FOR POLYPROPYLENE (PP) CORRUGATED WALL STORMWATER COLLECTION CHAMBERS".
- 2. MC-4500 CHAMBERS SHALL BE DESIGNED IN ACCORDANCE WITH ASTM F2787 "STANDARD PRACTICE FOR STRUCTURAL DESIGN OF THERMOPLASTIC CORRUGATED WALL STORMWATER COLLECTION CHAMBERS".
- 3. "ACCEPTABLE FILL MATERIALS" TABLE ABOVE PROVIDES MATERIAL LOCATIONS, DESCRIPTIONS, GRADATIONS, AND COMPACTION REQUIREMENTS FOR FOUNDATION, EMBEDMENT, AND FILL MATERIALS.
- 4. THE "SITE DESIGN ENGINEER" REFERS TO THE ENGINEER RESPONSIBLE FOR THE DESIGN AND LAYOUT OF THE STORMTECH CHAMBERS FOR THIS PROJECT.
- 5. THE SITE DESIGN ENGINEER IS RESPONSIBLE FOR ASSESSING THE BEARING RESISTANCE (ALLOWABLE BEARING CAPACITY) OF THE SUBGRADE SOILS AND THE DEPTH OF FOUNDATION STONE WITH CONSIDERATION FOR THE RANGE OF EXPECTED SOIL MOISTURE CONDITIONS.
- 6. PERIMETER STONE MUST BE EXTENDED HORIZONTALLY TO THE EXCAVATION WALL FOR BOTH VERTICAL AND SLOPED EXCAVATION WALLS.
- 7. ONCE LAYER 'C' IS PLACED, ANY SOIL/MATERIAL CAN BE PLACED IN LAYER 'D' UP TO THE FINISHED GRADE. MOST PAVEMENT SUBBASE SOILS CAN BE USED TO REPLACE THE MATERIAL REQUIREMENTS OF LAYER 'C' OR 'D' AT THE SITE DESIGN ENGINEER'S DISCRETION.

# Isolator<sup>®</sup> Row 0&M Manual

THE MOST ADVANCED NAME IN WATER MANAGEMENT SOLUTIONS<sup>™</sup>

# THE ISOLATOR® ROW

#### **INTRODUCTION**

An important component of any Stormwater Pollution Prevention Plan is inspection and maintenance. The StormTech Isolator Row is a technique to inexpensively enhance Total Suspended Solids (TSS) removal and provide easy access for inspection and maintenance.

#### THE ISOLATOR ROW

The Isolator Row is a row of StormTech chambers, either SC-160LP, SC-310, SC-310-3, SC-740, DC-780, MC-3500 or MC-4500 models, that is surrounded with filter fabric and connected to a closely located manhole for easy access. The fabric-wrapped chambers provide for settling and filtration of sediment as storm water rises in the Isolator Row and ultimately passes through the filter fabric. The open bottom chambers and perforated sidewalls (SC-310, SC- 310-3 and SC-740 models) allow storm water to flow both vertically and horizontally out of the chambers. Sediments are captured in the Isolator Row protecting the storage areas of the adjacent stone and chambers from sediment accumulation.

Two different fabrics are used for the Isolator Row. A woven geotextile fabric is placed between the stone and the Isolator Row chambers. The tough geotextile provides a media for storm water filtration and provides a durable surface for maintenance operations. It is also designed to prevent scour of the underlying stone and remain intact during high pressure jetting. A non-woven fabric is placed over the chambers to provide a filter media for flows passing through the perforations in the sidewall of the chamber. The non-woven fabric is not required over the SC-160LP, DC-780, MC-3500 or MC-4500 models as these chambers do not have perforated side walls.

The Isolator Row is typically designed to capture the "first flush" and offers the versatility to be sized on a volume basis or flow rate basis. An upstream manhole not only provides access to the Isolator Row but typically includes a high flow weir such that storm water flowrates or volumes that exceed the capacity of the Isolator Row overtop the over flow weir and discharge through a manifold to the other chambers.

The Isolator Row may also be part of a treatment train. By treating storm water prior to entry into the chamber system, the service life can be extended and pollutants such as hydrocarbons can be captured. Pre-treatment best management practices can be as simple as deep sump catch basins, oil-water separators or can be innovative storm water treatment devices. The design of the treatment train and selection of pretreatment devices by the design engineer is often driven by regulatory requirements. Whether pretreatment is used or not, the Isolator Row is recommended by StormTech as an effective means to minimize maintenance requirements and maintenance costs.

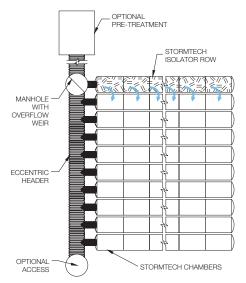

Note: See the StormTech Design Manual for detailed information on designing inlets for a StormTech system, including the Isolator Row.

Looking down the Isolator Row from the manhole opening, woven geotextile is shown between the chamber and stone base.

#### StormTech Isolator Row with Overflow Spillway (not to scale)

THE MOST ADVANCED NAME IN WATER MANAGEMENT SOLUTIONS™

# ISOLATOR ROW INSPECTION/MAINTENANCE

#### INSPECTION

The frequency of inspection and maintenance varies by location. A routine inspection schedule needs to be established for each individual location based upon site specific variables. The type of land use (i.e. industrial, commercial, residential), anticipated pollutant load, percent Imperviousness, climate, etc. all play a critical role in determining the actual frequency of inspection and maintenance practices.

At a minimum, StormTech recommends annual inspections. Initially, the Isolator Row should be inspected every 6 months for the first year of operation. For subsequent years, the inspection should be adjusted based upon previous observation of sediment deposition.

The Isolator Row incorporates a combination of standard manhole(s) and strategically located inspection ports (as needed). The inspection ports allow for easy access to the system from the surface, eliminating the need to perform a confined space entry for inspection purposes.

If upon visual inspection it is found that sediment has accumulated, a stadia rod should be inserted to determine the depth of sediment. When the average depth of sediment exceeds 3 inches throughout the length of the Isolator Row, clean-out should be performed.

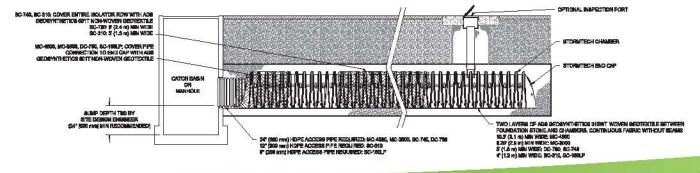

#### MAINTENANCE

The Isolator Row was designed to reduce the cost of periodic maintenance. By "Isolating" sediments to just one row, costs are dramatically reduced by eliminating the need to clean out each row of the entire storage bed. If inspection indicates the potential need for maintenance, access is provided via a manhole(s) located on the end(s) of the row for cleanout. If entry into the manhole is required, please follow local and OSHA rules for a confined space entries.

Maintenance is accomplished with the JetVac process. The JetVac process utilizes a high pressure water nozzle to propel itself down the isolator Row while scouring and suspending sediments. As the nozzle is retrieved, the captured pollutants are flushed back into the manhole for vacuuming. Most sewer and pipe maintenance companies have vacuum/JetVac combination vehicles. Selection of an appropriate JetVac nozzle will improve maintenance efficiency. Fixed nozzles designed for culverts or large diameter pipe cleaning are preferable. Rear facing jets with an effective spread of at least 45" are best. Most JetVac reels have 400 feet of hose allowing maintenance of an isolator Row up to 50 chambers long. The JetVac process shall only be performed on StormTech Isolator Rows that have AASHTO class 1 woven geotextile (as specified by StormTech) over their angular base stone.

#### StormTech Isolator Row (not to scale)

Note: Non-woven fabric is only required over the inlet pipe connection into the end cap for SC-160LP, DC-780, MC-3500 and MC-4500 chamber models and is not required over the entire isolator Row.

# **ISOLATOR ROW STEP BY STEP MAINTENANCE PROCEDURES**

### **STEP 1**

Inspect Isolator Row for sediment.

A) Inspection ports (if present)

- i. Remove lid from floor box frame
- ii. Remove cap from inspection riser
- iii. Using a flashlight and stadia rod, measure depth of sediment and record results on maintenance log.
- iv. If sediment is at or above 3 inch depth, proceed to Step 2. If not, proceed to Step 3.
- **B) All Isolator Rows** 
  - i. Remove cover from manhole at upstream end of Isolator Row
  - ii. Using a flashlight, inspect down Isolator Row through outlet pipe
    - 1. Mirrors on poles or cameras may be used to avoid a confined space entry
    - 2. Follow OSHA regulations for confined space entry if entering manhole
  - iii. If sediment is at or above the lower row of sidewall holes (approximately 3 inches), proceed to Step 2. If not, proceed to Step 3.

### **STEP 2**

Clean out Isolator Row using the JetVac process.

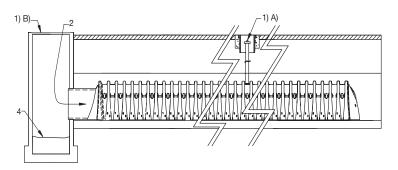

- A) A fixed floor cleaning nozzle with rear facing nozzle spread of 45 inches or more is preferable
- B) Apply multiple passes of JetVac until backflush water is clean
- C) Vacuum manhole sump as required

### **STEP 3**

Replace all caps, lids and covers, record observations and actions.

### STEP 4

Inspect & clean catch basins and manholes upstream of the StormTech system.

## I. Project Description

#### i. Background

The subject site is bound on the north by Aero Drive, on the south by existing residential, on the west and east by shared driveway and existing office complexes. Refer to the vicinity map in Appendix "A". The proposed project includes interior modifications and additions to the existing building and conversion of a portion of existing surface parking to parking structure, as well as private storm drain improvements for water quality and hydromodification management purposes.

The purpose of this drainage study is to quantify the existing and post-project drainage conditions to support grading and storm drain design for the Project, and to confirm that the project will not adversely affect existing offsite drainage infrastructure. Adverse effects to offsite drainage infrastructure can be avoided by limiting project condition peak flows to equal, or less than, existing condition peak flows. Storm water quality and hydromodification management plan (HMP) compliance is detailed in a separate document, the Storm Water Quality Management Plan (SWQMP).

The project does not include work within any wetland, stream, lake, pond, or any other waters regulated by the state, and is not anticipated to require Clean Water Act Section 404 or 401 permit or certification.

#### ii. Existing Condition

The existing site consists of a relatively level, rectangular-shaped property that presently supports the existing buildings and surface parking. The site drains via surface sheet flow to three discharge points.

Watershed A (Discharge Node 100): Runoff from the west portion of the site surface flows into the west driveway, as well as north into Aero Drive through curb cuts on the west side of a high point in Aero Drive. Surface flow is conveyed west, approx. 2,000 feet to catch basins just west of Afton Road. A 60" storm drain conveys water to a concrete-lined open channel that parallels the east edge of Interstate 805 before passing under to a natural channel. The natural channel flows south to a storm drain facility that conveys water into the San Diego River at approximately Mission Center Road.

Watershed B (Discharge Node 200): Runoff from the central and northeast portion of the site surface flows into Aero Drive through curb cuts and out of a driveway on the east side of a high point in Aero Drive. Surface flow is conveyed 1,200 feet east to a catch basin that discharges into an unnamed natural channel. Flow in the natural channel is conveyed under developments via storm drain and into the San Diego River at Interstate 805.

Watershed C (Discharge Node 300): Runoff from the southeast portion of the site drains through the existing wall located in the south east corner of the property and into the gutter of Ediwhar Avenue. Surface flow is conveyed into catch basins located about 2,000 feet south and east in Hammond Drive. Storm drains convey flow into the same unnamed natural channel. Flow in the natural channel is conveyed under developments via storm drain and into the San Diego River at approx. Interstate 805.

The San Diego River discharges to the Pacific Ocean just south of Mission Bay. There is no run-on to the site from adjacent properties. The existing condition hydrology map can be found in Appendix "G".

#### iii. Proposed Condition

The proposed site will be designed to maintain existing condition drainage patterns to the maximum extent practical. Runoff from the parking structure top level will sheet flow into the existing parking lots as in the existing condition. The parking structure straddles the site high point that divides watersheds A and B. Approximately half of the proposed parking structure will drain to Node 100 and the rest will drain to Node 200. The portion of the structure draining to Node 100 will not be captured in a water quality Best Management Practice (BMP). To compensate, an equivalent area of existing parking lot and

architecture | planning | interiors | branding | civil

building roof is included in water quality sizing and hydromodification flow controls at Discharge Node 200 (Point of Connection 1). These calculations are shown and explained in detail in the SWQMP.

Watershed B includes the additions to the existing building, as well as landscape and surface parking improvements. Drainage from these improvements will be conveyed via sheet flow into Biofiltration with Underdrain BMPs and into the hydromodification flow control detention BMP. The detention BMP will include an outlet structure with pump so that water can be discharged to street level as in the existing condition in compliance with HMP requirements, detailed in the SWQMP document. HMP requirements address storms up to the 10-year storm event. Flow in excess of the HMP compliance storm will overflow and/or bypass project BMPs and surface drain into Aero Drive, as in the existing condition.

Limited changes to Watershed C are anticipated as a result of the project. Landscaping will replace some surface parking area along the south edge of the existing building.

#### iv. Design Criteria and Methods

The rational method hydrologic model was used to determine the 100-year, 6-hour and 24-hr storm event peak flows in both the existing and project conditions for comparison. Computation criteria found in the City of San Diego Drainage Design Manual January 2017 Edition was used in Advanced Engineering Software (AES) 2016 calculations.

## II. Hydrology Analysis

### i. Rational Method Peak Flows

The existing and proposed condition hydrology maps provided in this report show the sub-areas used to generate flows for the site. The variables taken into consideration in the computation include rainfall, impervious percent, and land use conditions characteristics of flow conveyance, and time of concentration.

The soils map included in Appendix B indicates type D soils. Figure B-2 from the Manual shows that the 100-year 6-hour rainfall is 2.5 inches, included in Appendix C. Figure B-3 from the Manual shows that the 100-year 6-hour rainfall is 4 inches, included in Appendix D. The Antecedent Moisture Condition for the 100-year storm used is two. Runoff coefficients given in Table A-1 of the Manual were revised based on actual impervious percentages in the existing and project condition as shown in the tables below:

|          | EXISTING CONDITION |                |            |            |          |  |          | PROPOSED CONDITION |                |            |            |          |  |  |  |

The Rational Method via AES Hydrologic software derived the following flow rates for the existing and postdeveloped condition (see Appendix "E" and "F" for a detailed tabulation):

### III. Conclusion

Project condition calculations are conservative because they do not account for the storage and flood routing provided by project BMPs. Project improvements include an increase in pervious areas onsite, adding landscaping and biofiltration BMPs where surface parking exists today. As a result, project impacts decrease the amount of discharge expected at each discharge point, as well as in total, when compared to the existing condition. Therefore, no adverse impacts to offsite drainage infrastructure is anticipated.

Water quality and hydromodification flow control BMPs will be implemented to satisfy the requirements of the Natioanl Pollutant Discharge Elimination System (NPDES) permit locally regulated by San Diego Regional MS4 Permit (order R9-2013-0001), reissued by California Regional Water Quality Control Board (SDRWQCB) in May 2013 and amended by Order R9-2015-0001 and R9-2015-0100 and as demonstrated in the SWQMP.

# **1.0 INTRODUCTION AND SCOPE OF SERVICES**

# 1.1 Introduction

Construction Testing and Engineering, Inc. (CTE) has completed a geotechnical investigation and report providing conclusions and recommendations for the proposed hospital annex improvements located at 8875 Aero Drive (APN 421-3000-300), and proposed four-level parking structure to be located on the southern portion of the adjacent parcel at 8825 Aero Drive (APN 421-3000-200) (Figure 1).

The proposed scope of work for the hospital annex includes two wing additions to the existing 100,000 square foot structure and modifications to the proposed building entrance. The wing additions will increase the footprint of the existing structure by approximately 134,000 square feet.

A separate four-story above ground parking structure with associated at-grade parking and drive areas is proposed in the adjacent parcel to the west of the existing building (Figures 1 and 2). Associated improvements are to include flatwork, pavement, and bioretention basins.

CTE has performed this work in general accordance with the terms of proposal G-4337 dated March 16, 2018. Preliminary geotechnical recommendations for excavations, fill placement, and foundation design for the proposed improvements are presented herein.

# 1.2 Scope of Services

The scope of services provided included:

- Review of readily available geologic and soils reports.
- Review of historic topographic maps.
- Coordination of USA and private utility mark-out and location.
- Obtaining appropriate San Diego County Department of Environmental Health (DEH) Boring Permits.
- Excavation of exploratory borings and soil sampling utilizing a truck-mounted drill rig.
- Percolation testing in accordance with County of San Diego Department of Environmental Health (DEH) procedures.
- Establishing infiltration rates in accordance with City of San Diego Storm Water Standards (2018).
- Laboratory testing of selected soil samples.
- Description of the site geology and evaluation of potential geologic hazards.
- Engineering and geologic analysis.
- Preparation of this preliminary geotechnical report.

# **2.0 SITE DESCRIPTION**

The subject site is located at 8875 Aero Drive in San Diego, California (Figure 1). The site is bounded by Aero Drive to the north, commercial structures to the east and west, and residential development to the south. The current site area is illustrated on Figure 1. The proposed improvement area is currently developed with a large commercial structure with associated parking and flatwork, landscaping, utilities and other minor improvements. Based on reconnaissance and review of general site topography, it appears that the improvement area generally descends to the north with elevations ranging from approximately 420 feet above mean sea level in the south (msl) to approximately 413 feet msl to the north. The proposed site modifications and additions are depicted on Figure 2.

### 3.0 FIELD INVESTIGATION AND LABORATORY TESTING

## 3.1 Historical Topographic and Aerial Photograph Review

As part of the initial phase of investigation, area United States Geologic Survey historic topographic maps from 1903, 1930, 1943, 1953, 1967, and 1979 were reviewed. Aerial images from Google Earth were reviewed from 1996 to 2017. Based on the review, it appears that a shallow pond or vernal pool was present within the general site area prior to regional development. This feature was indicated to be within the proposed project area on the maps dating from 1943 to 1967 and to the southwest of the project area on the maps prior to 1943. The localized water feature was not shown on topographic maps post 1967.

Review of building plans for the Bank of America Central Cash Vault (existing structure at 8875 Aero Drive), prepared by Boyle Architectural Associates (no date), indicated that the existing foundation system consisted of continuous and spread footings placed on shallow structural fill. Based on the foundation schedule, the deepest footings were indicated to be two-feet nine inches below pad grades. Depth of the previously placed fill was not indicated, however, based on recent boring explorations the fill thickness surrounding the existing structure ranges from approximately five to seven feet below existing grades. In the area of the proposed parking structure the existing fill thickness is indicated to range from approximately one to four feet below existing grades.

# 3.2 Field Investigation

CTE performed the recent subsurface investigation on March 29, 2018 to evaluate underlying soil conditions. This fieldwork consisted of site reconnaissance, and the excavation of seven exploratory soil borings and seven percolation test holes. The borings were advanced to a maximum explored depth of approximately 18 feet below ground surface (bgs). Bulk samples were collected from the cuttings, and relatively undisturbed samples were collected by driving Standard Penetration Test (SPT) and Modified California (CAL) samplers. The borings and percolation test holes were excavated by a CME-95 truck-mounted drill rig equipped with eight-inch-diameter, hollow-stem augers. The percolation test holes were excavated to the depths ranging from approximately 3.0 to 5.1 feet below the ground surface (bgs). Approximate locations of the soil borings and test holes are shown on the attached Figure 2.

Soils were logged in the field by a CTE Engineering Geologist, and were visually classified in general accordance with the Unified Soil Classification System. The field descriptions have been modified, where appropriate, to reflect laboratory test results. Boring logs, including descriptions of the soils encountered, are included in Appendix B.

# 3.3 Laboratory Testing

Laboratory tests were conducted on selected soil samples for classification purposes, and to evaluate physical properties and engineering characteristics. Laboratory tests included: Maximum Density/Proctor Testing, Expansion Index, R-Value, Grain Size Analysis, Atterberg Limits,

Consolidation, and Chemical Characteristics. Test descriptions and laboratory test results are included in Appendix C.

## 4.0 GEOLOGY

# 4.1 General Setting

San Diego is located with the Peninsular Ranges physiographic province that is characterized by its northwest-trending mountain ranges, intervening valleys, and predominantly northwest trending active regional faults. The San Diego Region can be further subdivided into the coastal plain area, a central mountain–valley area, and the eastern mountain valley area. The project site is located within the coastal plain area. The coastal plain subprovince ranges in elevation from approximately sea level to 1200 feet above mean sea level (msl) and is characterized by Cretaceous and Tertiary sedimentary deposits that onlap an eroded basement surface consisting of Jurassic and Cretaceous crystalline rocks that have been repeatedly eroded and infilled and by alluvial processes throughout the Quaternary Period in response to regional uplift. This has resulted in a geomorphic landscape of uplifted alluvial and marine terraces that are dissected by current active alluvial drainages.

# 4.2 Geologic Conditions

Based on the regional geologic map prepared by Kennedy and Tan (2008), the near surface geologic unit that underlies the site consists of Quaternary Very Old Paralic Deposits Unit 8. Based on recent explorations, Quaternary Previously Placed Fill was observed overlying the Very Old Paralic Deposits. The Tertiary Mission Valley Formation is anticipated at depth beneath the Very Old Paralic Deposits. Descriptions of the geologic and soil units encountered during the investigation are presented below.

# 4.2.1 Quaternary Previously Placed Fill

Where observed, the Previously Placed Fill generally consists of stiff or loose to medium dense, brown, fine to medium grained sandy clay and clayey sand. Exploratory excavations encountered Previously Placed Fill to a maximum observed depth of approximately seven feet (bgs). As described above in Section 3.1, the fill thickness surrounding the existing structure was found to range from approximately five to seven feet below existing grades. In the area of the proposed parking structure the fill thickness is indicated to range from approximately one to four feet below existing grades. Isolated areas with deeper fill may be encountered during site excavations and grading.

# 4.2.2 Quaternary Very Old Paralic Deposits

Quaternary Very Old Paralic Deposits, (map unit Qvop 8 of Kennedy and Tan, 2008) were observed in all the investigation borings. Where observed, these materials generally consist of medium dense to very dense, mottled gray and reddish brown, silty to clayey fine to medium grained sandstone and cobble conglomerate. This unit is anticipated at depth throughout the site.

# 4.2.3 Groundwater Conditions

Groundwater was not encountered in any of the recent borings at the time of drilling. The borings were advanced to a maximum explored depth of approximately 18 feet bgs or to an

CTE Job No. 10-14209G

approximate elevation of 399 feet msl. Review of California State Water Resources Control Board-Geotracker electronic database found several sites in the general vicinity that provided regional groundwater information. According to various studies completed for the Broadstone site located approximately 800 to 1000 feet west of the subject site, regional groundwater was reported to be approximately 75 feet bgs (an approximate elevation of 337 To the north at Montgomery Field, regional groundwater was reported at msl). approximately 100 feet bgs, or at an approximate elevation of 315 feet msl (Geosoils Inc., 1998). However, Group Delta (2012) encountered localized perched lenses of groundwater at approximately 11 feet bgs, (approximate elevation of 400 feet msl) at the Broadstone site. Approximately 1,700 feet south of the subject site, near the intersection of Sandrock Road and Hammond Drive, Santec Consulting Services (2012) reported groundwater elevations ranging from 385.81 to 393.76 feet msl, with historic groundwater elevations from 1996 through 2008 ranging from approximately 387 to 391 feet msl. Groundwater flow direction was reported to be to the south-southeast. These groundwater elevations are consistent with the relatively shallow perched groundwater elevations reported at the Broadstone site.

Based on the recent site explorations and review of groundwater data from the adjacent area, regional static groundwater is generally anticipated at depths greater than proposed excavations as recommended herein. Although no groundwater was observed during the recent drilling, localized perched groundwater conditions could potentially be present at elevations shallower than approximately 400 feet msl.

While groundwater conditions may vary, especially following periods of sustained precipitation or irrigation, it is generally not anticipated to adversely affect the proposed shallow construction activities or the completed improvements, if irrigation is limited and proper site drainage is designed, installed, and maintained per the recommendations of the project civil engineer. Seepage and perched water conditions may locally be encountered in deeper site excavations.

# 4.3 Geologic Hazards

The site is located within City of San Diego Seismic Safety Zone Geologic Hazard Categories 51 and 52. Category 51 corresponds to "level mesas – underlain by terrace deposits and bedrock, nominal risk", and Category 52 corresponds to "other level areas, gently sloping to steep terrain, favorable geologic structure, low risk."

Geologic hazards considered to have potential impacts to site development were evaluated based on field observations, literature review, and laboratory test results. The following paragraphs discuss geologic hazards considered and associated potential risk to the site.

# 4.3.1 Surface Fault Rupture

Based on the site reconnaissance and review of referenced literature, the site is not within a local fault hazard zone or State of California -designated Alquist-Priolo Earthquake Fault Studies Zone, and no known active fault traces underlie or project toward the site. According to the California Division of Mines and Geology, a fault is active if it displays

evidence of activity in the last 11,000 years (Hart and Bryant, 1997). As such, the potential for surface rupture from displacement or fault movement beneath the proposed improvements is considered to be low.

# 4.3.2 Local and Regional Faulting

The California Geological Survey (CGS) and the United States Geological Survey (USGS) broadly group faults as "Class A" or "Class B" (Cao, 2003; Frankel et al., 2002). Class A faults are identified based upon relatively well-defined paleoseismic activity, and a fault-slip rate of more than 5 millimeters per year (mm/yr). In contrast, Class B faults have comparatively less defined paleoseismic activity and are considered to have a fault-slip rate less than 5 mm/yr. The nearest known Class B fault is the Rose Canyon Fault, which is approximately 7.0 kilometers southwest of the site (Blake, T.F., 2000). The nearest known Class A fault is the Julian segment of the Elsinore Fault, which is located approximately 57.6 kilometers northeast of the site.

The site could be subjected to significant shaking in the event of a major earthquake on any of the faults noted above or other faults in the southern California or northern Baja California area.

# 4.3.3 Liquefaction and Seismic Settlement Evaluation

Liquefaction occurs when saturated fine-grained sands or silts lose their physical strengths during earthquake-induced shaking and behave like a liquid. This is due to loss of point-to-point grain contact and transfer of normal stress to the pore water. Liquefaction

potential varies with water level, soil type, material gradation, relative density, and probable intensity and duration of ground shaking. Seismic settlement can occur with or without liquefaction; it results from densification of loose soils.

The site is underlain at shallow depths by medium dense to very dense formational materials (Very Old Paralic Deposits). Based on the noted subsurface conditions, the potential for liquefaction or significant seismic settlement at the site is considered to be low.

# 4.3.4 Tsunamis and Seiche Evaluation

According to McCulloch (1985), the potential in the San Diego County coastal area for "100-year" and "500-year" tsunami waves is approximately five and eight feet, or less. This suggests that there is a negligible probability of a tsunami reaching the site based on elevation of the area and distance from the Pacific Ocean. The site is not located in a zone of potential tsunami inundation based on emergency planning maps prepared by California Emergency Management Agency and CGS. In addition, oscillatory waves (seiches) are considered unlikely due to the absence of nearby confined bodies of water.

# 4.3.5 Landsliding

According to mapping by Tan (1995), the site is considered to be only "Marginally Susceptible" to landsliding, and no landslides are mapped in the site area. In addition, evidence of landslides or landslide potential was not observed during the field exploration at the relatively flat-lying site. Based on these findings, landsliding is not considered to be a significant geologic hazard at the subject site.

# 4.3.6 Compressible and Expansive Soils

Portions of the Previously Placed Fill soils are considered to be compressible in their current condition. Therefore, it is recommended that these soils be overexcavated, where necessary, and properly compacted beneath proposed improvement areas as recommended herein and as determined to be necessary during construction. Based on the field data, site observations, and CTE's experience with similar soils in the vicinity of the site, dense native soils underlying the site are not considered to be subject to significant compressibility under the proposed loads.

Based on laboratory testing and the generally granular nature of the subgrade materials, soils at the site are anticipated to exhibit Low expansion potential (Expansion Index of 50 or less). Therefore, expansive soils are generally not anticipated to present significant adverse impacts to site development if geotechnical recommendations are properly implemented. Additional evaluation of near-surface soils should be performed based on field observations during grading and excavation activities.

### 4.3.7 Corrosive Soils

Testing of representative site soils was performed to evaluate the potential corrosive effects on concrete foundations and buried metallic utilities. Soil environments detrimental to concrete generally have elevated levels of soluble sulfates and/or pH levels less than 5.5. According to the American Concrete Institute (ACI) Table 318 4.3.1, specific guidelines have been provided for concrete where concentrations of soluble sulfate (SO<sub>4</sub>) in soil exceed 0.10 percent by weight. These guidelines include low water:cement ratios, increased \\ESC SERVER\Projects\10-14209G\Rpt Geotechnical (May 2018).doc

#### CTE Job No. 10-14209G

compressive strength, and specific cement type requirements. A minimum resistivity value less than approximately 5,000 ohm-cm and/or soluble chloride levels in excess of 200 ppm generally indicate a corrosive environment for buried metallic utilities and untreated conduits.

Chemical test results indicate that near-surface soils at the site generally present a negligible corrosion potential for Portland cement concrete. Based on resistivity and chloride testing, the site soils have been interpreted to have a moderate to severe corrosivity potential to buried metal improvements.

Based on the results of the limited testing performed, it is likely prudent to utilize plastic piping and conduits where buried and feasible. However, CTE does not practice corrosion engineering. Therefore, if corrosion of metallic or other improvements is of more significant concern, a qualified corrosion engineer could be consulted.

### 5.0 STORMWATER INFILTRATION - PRELIMINARY FESIBILITY SCREENING

## 5.1 Purpose

As part of the geotechnical site assessment, CTE completed a preliminary feasibility screening of the subject site for storm water infiltration. The preliminary screening was completed in accordance with the City of San Diego Storm Water Standards (January 2018) for the purpose of providing geotechnical-geologic characteristics, groundwater information, and estimates of vertical infiltration

rates that can be incorporated by the project Storm Water Quality Management Plan (SWQMP) preparer (e.g. Project Architect, Civil Engineer), in the process of developing a comprehensive storm water management plan. The information can also be used to facilitate the final storm water design in accordance with the water quality and hydro modification criteria of the MS4 permitting process.

# 5.2 Test Procedures

The shallow borehole percolation methodology was used to establish percolation rates. This is considered an acceptable method of percolation testing, as stated in the City of San Diego BMP Design Manual, Appendix D (February, 2018). The percolation test procedure was completed in general accordance with the County of San Diego Department of Environmental Health (DEH), Version 2010 guidelines. The percolation rates account for both lateral and vertical flow through the tested section. The derived percolation rates were then converted to infiltration rates following the procedures of the Porchet Method, as recommended by the BMP Design Manual, Appendix D (February, 2018). The percolation test methodology, field data, and infiltration conversion calculations are presented in Appendix E. The Model BMP Design Manual, Worksheet C.4.1 "Categorization of Infiltration Feasibility Conditions", is also presented in Appendix E.

# 5.3 Site Background and Characterization

Review of the Natural Resources Conservation Service (NRCS) website indicates that agricultural soil types in the site area are classified as Redding gravelly loam, gravelly clay, and gravelly clay loam (Map Unit-Rdc). The Rdc map unit, as defined by the NRCS, is assigned a hydrologic soil group (D), in accordance with the United States Department of Agriculture (USDA). These USDA soil types were generally confirmed with the geotechnical logs of borings from the recent investigation, as described in Section 4.2.1 and 4.2.2 above, which encountered Quaternary Very Old Paralic Deposits (Map Unit Qop- 8 of Kennedy and Tan, 2008), and Quaternary Previously Placed Fill consisting of re-worked formational deposits.

As described in Section 4.2.3, regional static groundwater elevations are estimated to be 76 to 83 feet below existing grades. Groundwater was not encountered at the time of drilling during our recent investigation to depths of approximately 18 feet bgs. However, based on review of adjacent projects, perched groundwater could be expected at depths ranging from approximately 22 to 33 feet bgs.

As the project is in the conceptual phase of design, percolation test borings were conducted in representative areas such that the entire site would be accurately characterized in terms of infiltration potential. In total, seven percolation test borings were advanced to depths ranging from approximately three to five feet below existing grades.

# 5.3 Percolation Test Results and Calculated Infiltration Rates

The following table presents a summary of the percolation test results conducted within the subject site, the soil type encountered in each test boring, the depth of each test boring, the derived percolation rate, the calculated infiltration rate, and a recommended design rate derived by applying a safety factor of two to the calculated infiltration rate in accordance with the City of San Diego BMP Design Manual, Appendix D (January, 2018). The percolation tests met Case I conditions (Appendix E).

| TABLE 5.3<br>SUMMARY OF PERCOLATION AND INFILTRATION TEST RESULTS |           |             |          |               |                   |                  |  |
|---|-----------|-------------|----------|---------------|-------------------|------------------|--|
| Test  | Soil Type | San Diego   | Depth    | Percolation   | Infiltration Rate | Recommended      |  |
| Location  |           | County      | (inches) | Rate          | (inches/hour)     | Rate for Design* |  |
|   |           | Percolation |          | (inches/hour) |                   | (inches/hour)    |  |

\* A safety factor of two (2) was applied to the calculated infiltration rate

Qvop = Quaternary Very Old Paralic Deposits, (Map Unit Qop- 8 of Kennedy and Tan, 2008)

The calculated infiltration rates within both the Quaternary Very Old Paralic Deposits and the Quaternary Previously Placed Fill were all found to be below the defined lower boundary infiltration of rate of 0.05 inches per hour for partial infiltration as defined by the City of San Diego BMP Design Manual (January 2018), Appendix C. For Planning Phase feasibility screening and design of partial infiltration BMP's, a factor of safety of 2 is required in accordance with Appendix C of the

City of San Diego BMP Design Manual (January 2018). As shown in the above table, this further reduces the infiltration below the cutoff rate for partial infiltration classification. As such, the results of the preliminary site screening indicate that the site classifies as a "No Infiltration Condition".

# 5.4 Infiltration Recommendations

Although the preliminary screening indicates that the entire site classifies as not suitable for partial infiltration, the SWQMP preparer could consider modification of the existing site soils for a proposed BMP infiltration basin provided the potential modified basin area conforms with all structural setback criteria as defined in Appendix C of the City of San Diego BMP Design Manual (January 2018). The main structural setbacks at the site would be distances from building foundations and utility trenches. The site is considered feasible with respect to other geotechnical-geologic criteria including depths to groundwater, expansive soils, settlement or volume change, and slope stability. Replacement of existing soils with improved infiltration feasibility soils could be an option provided the BMP dimensions are capable of temporarily storing DMA water volumes associated with the underlying lower infiltration rates as documented as part of this feasibility screening.

#### 6.0 CONCLUSIONS AND RECOMMENDATIONS

### 6.1 General

CTE concludes that the proposed improvements on the site are feasible from a geotechnical standpoint, provided the preliminary recommendations in this report are incorporated into the design and construction of the project. Recommendations for the proposed earthwork and improvements are included in the following sections and Appendix D. However, recommendations in the text of this report supersede those presented in Appendix D should conflicts exist. These preliminary recommendations should either be confirmed as appropriate or updated following required excavations, demolition of existing improvements, and observations during site preparation.

### 6.2 Site Preparation

Prior to grading, the site should be cleared of existing construction debris and vegetation, not suitable for structural backfill and be properly disposed of offsite. In areas to receive structural improvements, overexcavation beneath slab areas should extend to a minimum depth of two feet below finish subgrade. Foundation elements for both the existing building modifications and the new proposed parking structure are to be extended to the depth of dense native materials.

Excavations adjacent to the existing structure should generally not extend below a 1:1 plane extended down from the bottom of existing footings or as recommended during grading based on the exposed conditions. Depending on the depth and proximity of the existing building footings to remain, alternating slot excavations could be required during earthwork.

Overexcavations for proposed surface improvement areas, such as pavement or flatwork should be conducted to a depth of two feet below proposed subgrade.

If encountered, existing below-ground utilities should be redirected around proposed structures. Existing utilities at an elevation to extend through the proposed footings should generally be sleeved and caulked to minimize the potential for moisture migration below the building slabs. Abandoned pipes exposed by grading should be securely capped or filled with minimum two-sack cement/sand slurry to help prevent moisture from migrating beneath foundation and slab soils.

A CTE representative should observe the exposed ground surface prior to placement of compacted fill to document and verify the competency of the encountered subgrade materials. If unsuitable material is exposed at the base of excavations additional removals may be recommended. After approval by this office, the exposed subgrades to receive fill should be scarified a minimum of eight inches, moisture conditioned, and properly compacted prior to additional compacted fill placement.

# 6.3 Site Excavation

Based on CTE's observations, shallow excavations at the site should be feasible using wellmaintained heavy-duty construction equipment run by experienced operators. However, localized very dense zones consisting of cemented conglomerate formation may be encountered, which could result in very difficult excavation.

# 6.4 Fill Placement and Compaction

Following the recommended overexcavation of loose or disturbed soils, the areas to receive fills should be scarified approximately eight inches, moisture conditioned, and properly compacted. Fill and backfill should be compacted to a minimum relative compaction of 90 percent at a moisture content of at least two percent above optimum, as evaluated by ASTM D 1557. The optimum lift thickness for fill soil depends on the type of compaction equipment used. Generally, backfill should be placed in uniform, horizontal lifts not exceeding eight inches in loose thickness. Fill placement and compaction should be conducted in conformance with local ordinances, and should be observed and tested by a CTE geotechnical representative.

### 6.5 Fill Materials

Properly moisture-conditioned very low to low expansion potential soils derived from the on-site excavations are considered suitable for reuse on the site as compacted fill. If used, these materials should be screened of organics and materials generally greater than three inches in maximum dimension. Irreducible materials greater than three inches in maximum dimension should generally not be used in shallow fills (within three feet of proposed grades). In utility trenches, adequate bedding should surround pipes.

Imported fill beneath structures, flatwork, and pavements should have an Expansion Index of 20 or less (ASTM D 4829). Proposed import fill soils for use in structural or slope areas should be evaluated by the geotechnical engineer before being transported to the site.

If retaining walls are proposed, backfill located within a 45-degree wedge extending up from the heel of the wall should consist of soil having an Expansion Index of 20 or less (ASTM D 4829) with less than 30 percent passing the No. 200 sieve. The upper 12 to 18 inches of wall backfill should consist of lower permeability soils, in order to reduce surface water infiltration behind walls. The project structural engineer and/or architect should detail proper wall backdrains, including gravel drain zones, fills, filter fabric, and perforated drain pipes. A conceptual wall backdrain detail, which may be suitable for use at the site, is provided as Figure 4.

# 6.6 Temporary Construction Slopes

The following recommended slopes should be relatively stable against deep-seated failure, but may experience localized sloughing. On-site soils are considered Type B and Type C soils with recommended slope ratios as set forth in Table 6.6.

| TABLE 6.6<br>RECOMMENDED TEMPORARY SLOPE RATIOS              |                    |         |  |  |  |
|--|--------------------|---------|--|--|--|
| SOIL TYPESLOPE RATIO<br>(Horizontal: vertical)MAXIMUM HEIGHT |                    |         |  |  |  |
| B (Very Old Paralic Deposits)                                | 1:1 (OR FLATTER)   | 10 Feet |  |  |  |
| C (Previously Placed Fill)                                   | 1.5:1 (OR FLATTER) | 10 Feet |  |  |  |

Actual field conditions and soil type designations must be verified by a "competent person" while excavations exist, according to Cal-OSHA regulations. In addition, the above sloping recommendations do not allow for surcharge loading at the top of slopes by vehicular traffic, equipment or materials. Appropriate surcharge setbacks must be maintained from the top of all unshored slopes.

## 6.7 Foundations and Slab Recommendations

The following recommendations are for preliminary design purposes only. These foundation recommendations should be re-evaluated after review of the project grading and foundation plans, and after completion of rough grading of the building pad areas. Upon completion of rough pad grading, Expansion Index of near surface soils should be verified, and these recommendations should be updated, if necessary.

## 6.7.1 Foundations

Foundation recommendations presented herein are based on the anticipated low expansion potential of site soils (Expansion Index of 50 or less).

Following the recommended preparatory grading, continuous and isolated spread footings are anticipated to be suitable for use at this site. Foundation dimensions and reinforcement should be based on allowable bearing values of 4,000 pounds per square foot (psf) for minimum 18-inch wide footings embedded a minimum of 36-inches below lowest adjacent subgrade elevation and extended to the depth of dense native formational material, as

required. Isolated footings should be at least 24 inches in minimum dimension. The allowable bearing value may be increased by 250 psf for each additional six inches of embedment up to a maximum of 6,500 psf. The allowable bearing value may also be increased by one-third for short-duration loading, which includes the effects of wind or seismic forces.

In order to approximate minimum required footing depths, it is anticipated that suitable dense native bearing material will be encountered at, or slightly below, the bottom of existing fills. Approximate fill depths based on the investigation findings are shown on Figure 2. Localized areas of deeper fill or unsuitable soils may be encountered that would require deeper excavation for proposed footings.

Minimum reinforcement for continuous footings should consist of four No. 6 reinforcing bars; two placed near the top and two placed near the bottom, or as per the project structural engineer. The structural engineer should design isolated footing reinforcement. An uncorrected subgrade modulus of 140 pounds per cubic inch is considered suitable for elastic foundation design.

The structural engineer should provide recommendations for reinforcement of any spread footings and footings with pipe penetrations. Footing excavations should generally be maintained above optimum moisture content until concrete placement.

## 6.7.2 Foundation Settlement

For structures founded on footings extended to dense native material, the maximum total static settlement is expected to be on the order of one inch and the maximum differential settlement is expected to be on the order of 0.5 inch over a distance of 50 feet. Due to the nature of underlying materials, dynamic settlement is not expected to significantly affect the proposed buildings.

## 6.7.3 Foundation Setback

Footings for structures should be designed such that the horizontal distance from the face of adjacent slopes to the outer edge of the footing is at least 10 feet. In addition, footings should bear beneath a 1:1 plane extended up from the nearest bottom edge of adjacent trenches and/or excavations. Deepening of affected footings may be a suitable means of attaining the prescribed setbacks.

## 6.7.4 Interior Concrete Slabs

Lightly loaded interior concrete slabs for non-traffic areas should be a minimum of 5.0 inches thick, or slabs should be designed to match existing thickness at building modification boundaries per recommendations of the project structural engineer. Minimum reinforcement for lightly loaded slabs should consist of #4 reinforcing bars placed on maximum 18-inch centers, each way, at or above mid-slab height, but with proper cover or as per the recommendations of the project structural engineer.

CTE Job No. 10-14209G

In moisture-sensitive non-traffic floor areas, a suitable vapor retarder of at least 15-mil thickness (with all laps or penetrations sealed or taped) overlying a four-inch layer of consolidated aggregate base or gravel (with SE of 30 or more) should be installed. An optional maximum two-inch layer of similar material may be placed above the vapor retarder to help protect the membrane during steel and concrete placement. This recommended protection is generally considered typical in the industry. If proposed floor areas or coverings are considered especially sensitive to moisture emissions, additional recommendations from a specialty consultant could be obtained. CTE is not an expert at preventing moisture penetration through slabs. A qualified architect or other experienced professional should be contacted if moisture penetration is a more significant concern.

Parking garage slabs subjected to heavier loads and traffic will require thicker slab sections and/or increased reinforcement. Minimum underlayment for the parking garage slab is to consist of 6 inches of non-recycled class 2 base. Aggregate base and the upper foot of underlying subgrade are to be compacted to 95% relative compaction.

A 110-pci subgrade modulus is considered suitable for elastic design of minimally embedded improvements such as slabs-on-grade.

Subgrade materials should be maintained at a minimum of two percent above optimum moisture content until slab underlayment and concrete are placed.

## 6.8 Seismic Design Criteria

The seismic ground motion values listed in the table below were derived in accordance with the ASCE 7-10 Standard. This was accomplished by establishing the Site Class based on the soil properties at the site, and calculating the site coefficients and parameters using the United States Geological Survey Seismic Design Maps application. These values are intended for the design of structures to resist the effects of earthquake ground motions for the site coordinates 32.8088° latitude and  $-117.1374^{\circ}$  longitude, as underlain by soils corresponding to site Class C.

| TABLE 6.8<br>SEISMIC GROUND MOTION VALUES (CODE-BASED)<br>2016 CBC AND ASCE 7-10 |       |                                 |  |  |  |  |  |  |  |

## 6.9 Lateral Resistance and Earth Pressures

Lateral loads acting against structures may be resisted by friction between the footings and the supporting soil or passive pressure acting against structures. If frictional resistance is used, allowable coefficients of friction of 0.30 (total frictional resistance equals the coefficient of friction multiplied by the dead load) for concrete cast directly against compacted fill is recommended. A design passive resistance value of 250 pounds per square foot per foot of depth (with a maximum value of 2,500 pounds per square foot) may be used. The allowable lateral resistance can be taken as the sum of the frictional resistance and the passive resistance, provided the passive resistance does not exceed two-thirds of the total allowable resistance.

Retaining walls backfilled using granular soils may be designed using the equivalent fluid unit weights given in Table 6.9 below.

| TABLE 6.9<br>EQUIVALENT FLUID UNIT WEIGHTS (G <sub>h</sub> )<br>(pounds per cubic foot) |                |   |  |  |  |  |  |  |  |
|---|----------------|---|--|--|--|--|--|--|--|
| WALL TYPE   | LEVEL BACKFILL | SLOPE BACKFILL<br>2:1 (HORIZONTAL:<br>VERTICAL) |  |  |  |  |  |  |  |
| CANTILEVER WALL<br>(YIELDING)   | 35             | 55  |  |  |  |  |  |  |  |
| RESTRAINED WALL   | 55             | 65  |  |  |  |  |  |  |  |

Lateral pressures on cantilever retaining walls (yielding walls) over six feet high due to earthquake motions may be calculated based on work by Seed and Whitman (1970). The total

lateral earth pressure against a properly drained and backfilled cantilever retaining wall above the groundwater level can be expressed as:

 $\mathbf{P}_{\mathrm{AE}} = \mathbf{P}_{\mathrm{A}} + \Delta \mathbf{P}_{\mathrm{AE}}$ 

For non-yielding (or "restrained") walls, the total lateral earth pressure may be similarly calculated based on work by Wood (1973):

 $P_{KE} = P_K + \Delta P_{KE}$ 

Where  $P_A/b$  = Static Active Earth Pressure =  $G_h H^2/2$ 

 $P_{\rm K}/b$  = Static Restrained Wall Earth Pressure =  $G_{\rm h} {\rm H}^2/2$ 

 $\Delta P_{AE}/b$  = Dynamic Active Earth Pressure Increment = (3/8) k<sub>h</sub>  $\gamma H^2/2$ 

 $\Delta P_{KE}/b$  = Dynamic Restrained Earth Pressure Increment =  $k_h \gamma H^2/2$ 

b = unit length of wall

 $k_h = 2/3 PGA_m$  (PGA<sub>m</sub> given previously Table 6.8)

 $G_h$  = Equivalent Fluid Unit Weight (given previously Table 6.9)

H = Total Height of the retained soil

 $\gamma$  = Total Unit Weight of Soil  $\approx$  135 pounds per cubic foot

The static and increment of dynamic earth pressure in both cases may be applied with a line of action located at H/3 above the bottom of the wall (SEAOC, 2013).

#### CTE Job No. 10-14209G

These values assume non-expansive backfill and free-draining conditions. Measures should be taken to prevent moisture buildup behind all retaining walls. Drainage measures should include freedraining backfill materials and sloped, perforated drains. These drains should discharge to an appropriate off-site location. Figure 4 shows a conceptual wall backdrain detail that may be suitable for walls at the subject site. Waterproofing should be as specified by the project architect.

#### 6.10 Exterior Flatwork

Flatwork should be installed with crack-control joints at appropriate spacing as designed by the project architect to reduce the potential for cracking in exterior flatwork caused by minor movement of subgrade soils and concrete shrinkage. Additionally, it is recommended that flatwork be installed with at least number 4 reinforcing bars at 24-inch centers, each way, at or above mid-height of slab, but with proper concrete cover, or with other reinforcement per the applicable project designer. Flatwork that should be installed with crack control joints, includes driveways, sidewalks, and architectural features. All subgrades should be prepared according to the earthwork recommendations previously given before placing concrete. Positive drainage should be established and maintained next to all flatwork. Subgrade materials should be maintained at a minimum of two percent above optimum moisture content until the time of concrete placement.

## 6.11 Vehicular Pavement

The proposed improvements include paved vehicle drive and parking areas. Presented in Table 6.11 are preliminary pavement sections utilizing laboratory determined Resistance "R" Value. Actual traffic area slab sections to be provided by the structural designer. Beneath proposed pavement areas, the upper 12 inches of subgrade and all base materials should be compacted to 95% relative compaction in accordance with ASTM D1557, and at a minimum of two percent above optimum moisture content.

| TABLE 6.11<br>RECOMMENDED PAVEMENT THICKNESS |                          |                                      |  |  |  |  |  |  |  |  |  |
|--|--------------------------|--------------------------------------|--|--|--|--|--|--|--|--|--|
| Traffic Area                                 | Assumed<br>Traffic Index | Preliminary<br>Subgrade<br>"R"-Value | Asphalt F<br>AC<br>Thickness<br>(inches) | Pavements<br>Class II<br>Aggregate Base<br>Thickness<br>(inches) | Portland Cement<br>Concrete<br>Pavements, on<br>Subgrade Soils<br>(inches) |  |  |  |  |  |  |

\* Caltrans Class 2 aggregate base

\*\* Concrete should have a modulus of rupture of at least 600 psi

Following rough site grading, CTE recommends laboratory testing of representative subgrade soils

for as-graded "R"-Value.

Asphalt paved areas should be designed, constructed, and maintained in accordance with the recommendations of the Asphalt Institute, or other widely recognized authority. Concrete paved areas should be designed and constructed in accordance with the recommendations of the American

Concrete Institute or other widely recognized authority, particularly with regard to thickened edges, joints, and drainage. The Standard Specifications for Public Works construction ("Greenbook") or Caltrans Standard Specifications may be referenced for pavement materials specifications.

## 6.12 Drainage

Surface runoff should be collected and directed away from improvements by means of appropriate erosion-reducing devices and positive drainage should be established around the proposed improvements. Positive drainage should be directed away from improvements at a gradient of at least two percent for a distance of at least five feet. However, the project civil engineers should evaluate the on-site drainage and make necessary provisions to keep surface water from affecting the site.

Generally, CTE recommends against allowing water to infiltrate building pads or adjacent to slopes. CTE understands that some agencies are encouraging the use of storm-water cleansing devices. Use of such devices tends to increase the possibility of adverse effects associated with high groundwater including slope instability and liquefaction. See Appendix E for further discussion of site infiltration.

## 6.12 Slopes

Based on anticipated soil strength characteristics, fill slopes if proposed, should be constructed at slope ratios of 2:1 (horizontal: vertical) or flatter. These fill slope inclinations should exhibit factors of safety greater than 1.5.

Although properly constructed slopes on this site should be grossly stable, the soils will be somewhat erodible. Therefore, runoff water should not be permitted to drain over the edges of slopes unless that water is confined to properly designed and constructed drainage facilities. Erosion-resistant vegetation should be maintained on the face of all slopes.

Typically, soils along the top portion of a fill slope face will creep laterally. CTE recommends against building distress-sensitive hardscape improvements within five feet of slope crests, and against using thickened edges in this area.

## 6.13 Controlled Low Strength Materials (CLSM)

Controlled Low Strength Materials (CLSM) may be used in deepened footing excavation areas, building pads, and/or adjacent to retaining walls or other structures, provided the appropriate following recommendations are also incorporated. Minimum overexcavation depths recommended herein beneath slabs, flatwork, and other areas may be applicable beneath CLSM if/where CLSM is to be used, and excavation bottoms should be observed by CTE prior to placement of CLSM. Prior to CLSM placement, the excavation should be free of debris, loose soil materials, and water. Once specific areas to utilize CLSM have been determined, CTE should review the locations to determine if additional recommendations are appropriate.

CLSM should consist of a minimum three-sack cement/sand slurry with a minimum 28-day compressive strength of 100 psi (or equal to or greater than the maximum allowable short term soil bearing pressure provided herein, whichever is higher) as determined by ASTM D4832. If re-

excavation is anticipated, the compressive strength of CLSM should generally be limited to a maximum of 150 psi per ACI 229R-99. Where re-excavation is required, two-sack cement/sand slurry may be used to help limit the compressive strength. The allowable soils bearing pressure and coefficient of friction provided herein should still govern foundation design. CLSM may not be used in lieu of structural concrete where required by the structural engineer.

## 6.14 Plan Review

CTE should be authorized to review the project grading and foundation plans prior to commencement of earthwork in order to provide additional recommendations, if necessary.

## 6.15 Construction Observation

The recommendations provided in this report are based on preliminary design information for the proposed construction and the subsurface conditions observed in the soil borings. The interpolated subsurface conditions should be checked by CTE during construction with respect to anticipated conditions. Upon completion of precise grading, if necessary, soil samples will be collected to evaluate as-built Expansion Index. Foundation recommendations may be revised upon completion of grading, and as-built laboratory tests results. Additionally, soil samples should be taken in pavement subgrade areas upon rough grading to refine pavement recommendations as necessary.

Recommendations provided in this report are based on the understanding and assumption that CTE will provide the observation and testing services for the project. All earthwork should be observed and tested in accordance with recommendations contained within this report. CTE should evaluate footing excavations before reinforcing steel placement.

## 7.0 LIMITATIONS OF INVESTIGATION

The field evaluation, laboratory testing and geotechnical analysis presented in this report have been conducted according to current engineering practice and the standard of care exercised by reputable geotechnical consultants performing similar tasks in this area. No other warranty, expressed or implied, is made regarding the conclusions, recommendations and opinions expressed in this report. Variations may exist and conditions not observed or described in this report may be encountered during construction. This report is prepared for the project as described. It is not prepared for any other property or party.

The recommendations provided herein have been developed in order to reduce the post-construction movement of site improvements. However, even with the design and construction recommendations presented herein, some post-construction movement and associated distress may occur.

The findings of this report are valid as of the present date. However, changes in the conditions of a property can occur with the passage of time, whether they are due to natural processes or the works of man on this or adjacent properties. In addition, changes in applicable or appropriate standards may occur, whether they result from legislation or the broadening of knowledge. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside CTE's involvement. Therefore, this report is subject to review and should not be relied upon after a period of three years.

CTE's conclusions and recommendations are based on an analysis of the observed conditions. If conditions different from those described in this report are encountered, CTE should be notified and additional recommendations, if required, will be provided subject to CTE remaining as authorized geotechnical consultant of record. This report is for use of the project as described. It should not be utilized for any other project.

The percolation test results were obtained in accordance with City and County standards and were performed with the standard of care practiced by other professionals practicing in the area. However, percolation test results can significantly vary laterally and vertically due to slight changes in soil type, degree of weathering, secondary mineralization, and other physical and chemical variabilities. As such, the test results are only considered as an estimate of percolation and converted infiltration rates for design purposes. No guarantee is made based on the percolation testing to the actual functionality or longevity of associated infiltration basins or other BMP devices designed from the presented infiltration rates.

CTE Job No. 10-14209G

Page 35

CTE's conclusions and recommendations are based on an analysis of the observed conditions. If conditions different from those described in this report are encountered during construction, this office should be notified and additional recommendations, if required, will be provided.

CTE appreciate this opportunity to be of service on this project. If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Respectfully submitted,

CONSTRUCTION TESTING & ENGINEERING, INC.

# APPENDIX C

# LABORATORY METHODS AND RESULTS

## LABORATORY METHODS AND RESULTS

#### Laboratory Testing Program

Laboratory tests were performed on representative soil samples to detect their relative engineering properties. Tests were performed following test methods of the American Society for Testing Materials or other accepted standards. The following presents a brief description of the various test methods used.

## **Classification**

Soils were classified visually according to the Unified Soil Classification System. Visual classifications were supplemented by laboratory testing of selected samples according to ASTM D2487. The soil classifications are shown on the Exploration Logs in Appendix B.

## Modified Proctor

Laboratory maximum dry density and optimum moisture content were evaluated according to ASTM D 1557, Method A. A mechanically operated rammer was used during the compaction process.

#### Expansion Index

Expansion testing was performed on selected samples of the matrix of the on-site soils according to ASTM D 4829.

#### Resistance "R"-Value

The resistance "R"-value was determined by the California Materials Method No. 301 for representative subbase soils. Samples were prepared and exudation pressure and "R"-value determined. The graphically determined "R"- value at exudation pressure of 300 psi is the value used for pavement section calculation.

## Particle-Size Analysis

Particle-size analyses were performed on selected representative samples according to ASTM D 422.

## Atterberg Limits

The procedure of ASTM D4518-84 was used to measure the liquid limit, plastic limit and plasticity index of representative samples.

## **Consolidation**

To assess their compressibility and volume change behavior when loaded and wetted, relatively undisturbed samples of representative samples from the investigation were subject to consolidation tests in accordance with ASTM D 2435.

## Chemical Analysis

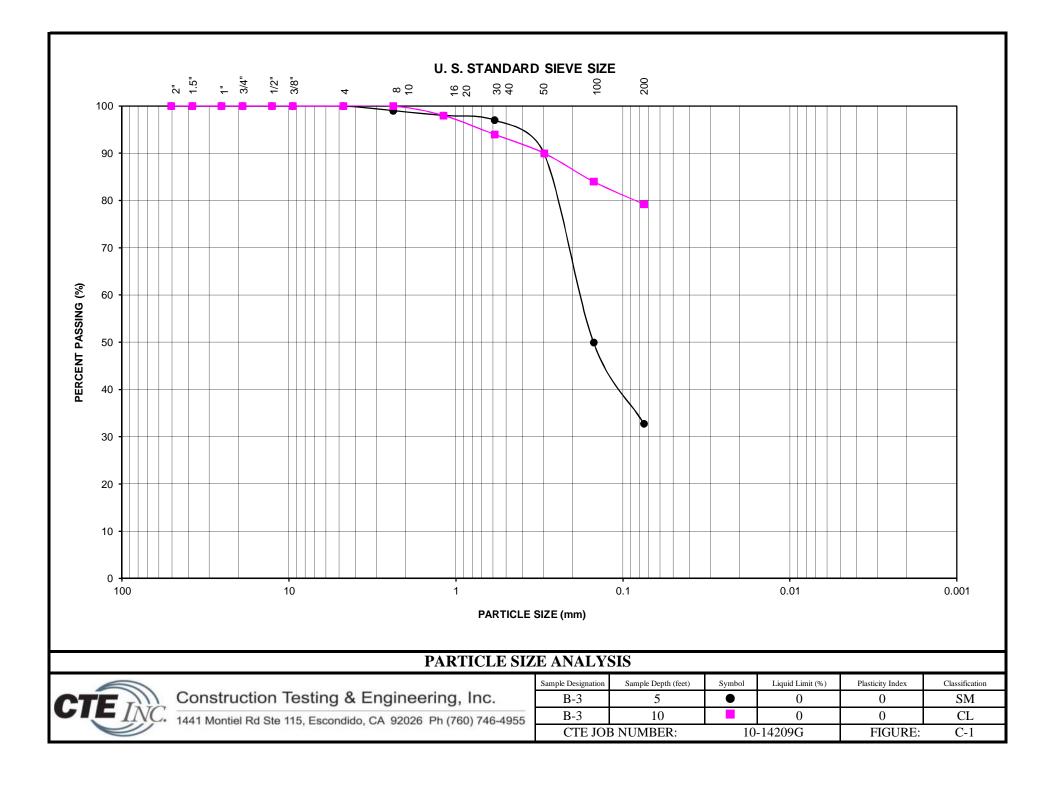

Soil materials were collected with sterile sampling equipment and tested for Sulfate and Chloride content, pH, Corrosivity, and Resistivity.

## APPENDIX D

## STANDARD SPECIFICATIONS FOR GRADING

### Section 1 - General

Construction Testing & Engineering, Inc. presents the following standard recommendations for grading and other associated operations on construction projects. These guidelines should be considered a portion of the project specifications. Recommendations contained in the body of the previously presented soils report shall supersede the recommendations and or requirements as specified herein. The project geotechnical consultant shall interpret disputes arising out of interpretation of the recommendations contained in the soils report or specifications contained herein.

### Section 2 - Responsibilities of Project Personnel

The <u>geotechnical consultant</u> should provide observation and testing services sufficient to general conformance with project specifications and standard grading practices. The geotechnical consultant should report any deviations to the client or his authorized representative.

The <u>Client</u> should be chiefly responsible for all aspects of the project. He or his authorized representative has the responsibility of reviewing the findings and recommendations of the geotechnical consultant. He shall authorize or cause to have authorized the Contractor and/or other consultants to perform work and/or provide services. During grading the Client or his authorized representative should remain on-site or should remain reasonably accessible to all concerned parties in order to make decisions necessary to maintain the flow of the project.

The Contractor is responsible for the safety of the project and satisfactory completion of all grading and other associated operations on construction projects, including, but not limited to, earth work in accordance with the project plans, specifications and controlling agency requirements.

#### Section 3 - Preconstruction Meeting

A preconstruction site meeting should be arranged by the owner and/or client and should include the grading contractor, design engineer, geotechnical consultant, owner's representative and representatives of the appropriate governing authorities.

#### Section 4 - Site Preparation

The client or contractor should obtain the required approvals from the controlling authorities for the project prior, during and/or after demolition, site preparation and removals, etc. The appropriate approvals should be obtained prior to proceeding with grading operations.

Clearing and grubbing should consist of the removal of vegetation such as brush, grass, woods, stumps, trees, root of trees and otherwise deleterious natural materials from the areas to be graded. Clearing and grubbing should extend to the outside of all proposed excavation and fill areas.

Demolition should include removal of buildings, structures, foundations, reservoirs, utilities (including underground pipelines, septic tanks, leach fields, seepage pits, cisterns, mining shafts, tunnels, etc.) and other man-made surface and subsurface improvements from the areas to be graded. Demolition of utilities should include proper capping and/or rerouting pipelines at the project perimeter and cutoff and capping of wells in accordance with the requirements of the governing authorities and the recommendations of the geotechnical consultant at the time of demolition.

Trees, plants or man-made improvements not planned to be removed or demolished should be protected by the contractor from damage or injury.

Debris generated during clearing, grubbing and/or demolition operations should be wasted from areas to be graded and disposed off-site. Clearing, grubbing and demolition operations should be performed under the observation of the geotechnical consultant.

#### Section 5 - Site Protection

Protection of the site during the period of grading should be the responsibility of the contractor. Unless other provisions are made in writing and agreed upon among the concerned parties, completion of a portion of the project should not be considered to preclude that portion or adjacent areas from the requirements for site protection until such time as the entire project is complete as identified by the geotechnical consultant, the client and the regulating agencies.

Precautions should be taken during the performance of site clearing, excavations and grading to protect the work site from flooding, ponding or inundation by poor or improper surface drainage. Temporary provisions should be made during the rainy season to adequately direct surface drainage away from and off the work site. Where low areas cannot be avoided, pumps should be kept on hand to continually remove water during periods of rainfall.

Rain related damage should be considered to include, but may not be limited to, erosion, silting, saturation, swelling, structural distress and other adverse conditions as determined by the geotechnical consultant. Soil adversely affected should be classified as unsuitable materials and should be subject to overexcavation and replacement with compacted fill or other remedial grading as recommended by the geotechnical consultant.

# STANDARD SPECIFICATIONS OF GRADING Page 2 of 26

The contractor should be responsible for the stability of all temporary excavations. Recommendations by the geotechnical consultant pertaining to temporary excavations (e.g., backcuts) are made in consideration of stability of the completed project and, therefore, should not be considered to preclude the responsibilities of the contractor. Recommendations by the geotechnical consultant should not be considered to preclude requirements that are more restrictive by the regulating agencies. The contractor should provide during periods of extensive rainfall plastic sheeting to prevent unprotected slopes from becoming saturated and unstable. When deemed appropriate by the geotechnical consultant or governing agencies the contractor shall install checkdams, desilting basins, sand bags or other drainage control measures.

In relatively level areas and/or slope areas, where saturated soil and/or erosion gullies exist to depths of greater than 1.0 foot; they should be overexcavated and replaced as compacted fill in accordance with the applicable specifications. Where affected materials exist to depths of 1.0 foot or less below proposed finished grade, remedial grading by moisture conditioning in-place, followed by thorough recompaction in accordance with the applicable grading guidelines herein may be attempted. If the desired results are not achieved, all affected materials should be overexcavated and replaced as compacted fill in accordance with the slope repair recommendations herein. If field conditions dictate, the geotechnical consultant may recommend other slope repair procedures.

#### Section 6 - Excavations

#### 6.1 Unsuitable Materials

Materials that are unsuitable should be excavated under observation and recommendations of the geotechnical consultant. Unsuitable materials include, but may not be limited to, dry, loose, soft, wet, organic compressible natural soils and fractured, weathered, soft bedrock and nonengineered or otherwise deleterious fill materials.

Material identified by the geotechnical consultant as unsatisfactory due to its moisture conditions should be overexcavated; moisture conditioned as needed, to a uniform at or above optimum moisture condition before placement as compacted fill.

If during the course of grading adverse geotechnical conditions are exposed which were not anticipated in the preliminary soil report as determined by the geotechnical consultant additional exploration, analysis, and treatment of these problems may be recommended.

#### 6.2 Cut Slopes

Unless otherwise recommended by the geotechnical consultant and approved by the regulating agencies, permanent cut slopes should not be steeper than 2:1 (horizontal: vertical).

The geotechnical consultant should observe cut slope excavation and if these excavations expose loose cohesionless, significantly fractured or otherwise unsuitable material, the materials should be overexcavated and replaced with a compacted stabilization fill. If encountered specific cross section details should be obtained from the Geotechnical Consultant.

When extensive cut slopes are excavated or these cut slopes are made in the direction of the prevailing drainage, a non-erodible diversion swale (brow ditch) should be provided at the top of the slope.

#### 6.3 Pad Areas

All lot pad areas, including side yard terrace containing both cut and fill materials, transitions, located less than 3 feet deep should be overexcavated to a depth of 3 feet and replaced with a uniform compacted fill blanket of 3 feet. Actual depth of overexcavation may vary and should be delineated by the geotechnical consultant during grading, especially where deep or drastic transitions are present.

For pad areas created above cut or natural slopes, positive drainage should be established away from the top-of-slope. This may be accomplished utilizing a berm drainage swale and/or an appropriate pad gradient. A gradient in soil areas away from the top-of-slopes of 2 percent or greater is recommended.

#### Section 7 - Compacted Fill

All fill materials should have fill quality, placement, conditioning and compaction as specified below or as approved by the geotechnical consultant.

#### 7.1 Fill Material Quality

Excavated on-site or import materials which are acceptable to the geotechnical consultant may be utilized as compacted fill, provided trash, vegetation and other deleterious materials are removed prior to placement. All import materials anticipated for use on-site should be sampled tested and approved prior to and placement is in conformance with the requirements outlined.

STANDARD SPECIFICATIONS OF GRADING Page 4 of 26 Rocks 12 inches in maximum and smaller may be utilized within compacted fill provided sufficient fill material is placed and thoroughly compacted over and around all rock to effectively fill rock voids. The amount of rock should not exceed 40 percent by dry weight passing the 3/4-inch sieve. The geotechnical consultant may vary those requirements as field conditions dictate.

Where rocks greater than 12 inches but less than four feet of maximum dimension are generated during grading, or otherwise desired to be placed within an engineered fill, special handling in accordance with the recommendations below. Rocks greater than four feet should be broken down or disposed off-site.

### 7.2 Placement of Fill

Prior to placement of fill material, the geotechnical consultant should observe and approve the area to receive fill. After observation and approval, the exposed ground surface should be scarified to a depth of 6 to 8 inches. The scarified material should be conditioned (i.e. moisture added or air dried by continued discing) to achieve a moisture content at or slightly above optimum moisture conditions and compacted to a minimum of 90 percent of the maximum density or as otherwise recommended in the soils report or by appropriate government agencies.

Compacted fill should then be placed in thin horizontal lifts not exceeding eight inches in loose thickness prior to compaction. Each lift should be moisture conditioned as needed, thoroughly blended to achieve a consistent moisture content at or slightly above optimum and thoroughly compacted by mechanical methods to a minimum of 90 percent of laboratory maximum dry density. Each lift should be treated in a like manner until the desired finished grades are achieved.

The contractor should have suitable and sufficient mechanical compaction equipment and watering apparatus on the job site to handle the amount of fill being placed in consideration of moisture retention properties of the materials and weather conditions.

When placing fill in horizontal lifts adjacent to areas sloping steeper than 5:1 (horizontal: vertical), horizontal keys and vertical benches should be excavated into the adjacent slope area. Keying and benching should be sufficient to provide at least six-foot wide benches and a minimum of four feet of vertical bench height within the firm natural ground, firm bedrock or engineered compacted fill. No compacted fill should be placed in an area after keying and benching until the geotechnical consultant has reviewed the area. Material generated by the benching operation should be moved sufficiently away from

the bench area to allow for the recommended review of the horizontal bench prior to placement of fill.

Within a single fill area where grading procedures dictate two or more separate fills, temporary slopes (false slopes) may be created. When placing fill adjacent to a false slope, benching should be conducted in the same manner as above described. At least a 3-foot vertical bench should be established within the firm core of adjacent approved compacted fill prior to placement of additional fill. Benching should proceed in at least 3-foot vertical increments until the desired finished grades are achieved.

Prior to placement of additional compacted fill following an overnight or other grading delay, the exposed surface or previously compacted fill should be processed by scarification, moisture conditioning as needed to at or slightly above optimum moisture content, thoroughly blended and recompacted to a minimum of 90 percent of laboratory maximum dry density. Where unsuitable materials exist to depths of greater than one foot, the unsuitable materials should be over-excavated.

Following a period of flooding, rainfall or overwatering by other means, no additional fill should be placed until damage assessments have been made and remedial grading performed as described herein.

Rocks 12 inch in maximum dimension and smaller may be utilized in the compacted fill provided the fill is placed and thoroughly compacted over and around all rock. No oversize material should be used within 3 feet of finished pad grade and within 1 foot of other compacted fill areas. Rocks 12 inches up to four feet maximum dimension should be placed below the upper 10 feet of any fill and should not be closer than 15 feet to any slope face. These recommendations could vary as locations of improvements dictate. Where practical, oversized material should not be placed below areas where structures or deep utilities are proposed. Oversized material should be placed in windrows on a clean, overexcavated or unyielding compacted fill or firm natural ground surface. Select native or imported granular soil (S.E. 30 or higher) should be placed and thoroughly flooded over and around all windrowed rock, such that voids are filled. Windrows of oversized material should be staggered so those successive strata of oversized material are not in the same vertical plane.

It may be possible to dispose of individual larger rock as field conditions dictate and as recommended by the geotechnical consultant at the time of placement.

STANDARD SPECIFICATIONS OF GRADING Page 6 of 26 The contractor should assist the geotechnical consultant and/or his representative by digging test pits for removal determinations and/or for testing compacted fill. The contractor should provide this work at no additional cost to the owner or contractor's client.

Fill should be tested by the geotechnical consultant for compliance with the recommended relative compaction and moisture conditions. Field density testing should conform to ASTM Method of Test D 1556-00, D 2922-04. Tests should be conducted at a minimum of approximately two vertical feet or approximately 1,000 to 2,000 cubic yards of fill placed. Actual test intervals may vary as field conditions dictate. Fill found not to be in conformance with the grading recommendations should be removed or otherwise handled as recommended by the geotechnical consultant.

### 7.3 Fill Slopes

Unless otherwise recommended by the geotechnical consultant and approved by the regulating agencies, permanent fill slopes should not be steeper than 2:1 (horizontal: vertical).

Except as specifically recommended in these grading guidelines compacted fill slopes should be over-built two to five feet and cut back to grade, exposing the firm, compacted fill inner core. The actual amount of overbuilding may vary as field conditions dictate. If the desired results are not achieved, the existing slopes should be overexcavated and reconstructed under the guidelines of the geotechnical consultant. The degree of overbuilding shall be increased until the desired compacted slope surface condition is achieved. Care should be taken by the contractor to provide thorough mechanical compaction to the outer edge of the overbuilt slope surface.

At the discretion of the geotechnical consultant, slope face compaction may be attempted by conventional construction procedures including backrolling. The procedure must create a firmly compacted material throughout the entire depth of the slope face to the surface of the previously compacted firm fill intercore.

During grading operations, care should be taken to extend compactive effort to the outer edge of the slope. Each lift should extend horizontally to the desired finished slope surface or more as needed to ultimately established desired grades. Grade during construction should not be allowed to roll off at the edge of the slope. It may be helpful to elevate slightly the outer edge of the slope. Slough resulting from the placement of individual lifts should not be allowed to drift down over previous lifts. At intervals not exceeding four feet in vertical slope height or the capability of available equipment, whichever is less, fill slopes should be thoroughly dozer trackrolled.

For pad areas above fill slopes, positive drainage should be established away from the top-of-slope. This may be accomplished using a berm and pad gradient of at least two percent.

### Section 8 - Trench Backfill

Utility and/or other excavation of trench backfill should, unless otherwise recommended, be compacted by mechanical means. Unless otherwise recommended, the degree of compaction should be a minimum of 90 percent of the laboratory maximum density.

Within slab areas, but outside the influence of foundations, trenches up to one foot wide and two feet deep may be backfilled with sand and consolidated by jetting, flooding or by mechanical means. If on-site materials are utilized, they should be wheel-rolled, tamped or otherwise compacted to a firm condition. For minor interior trenches, density testing may be deleted or spot testing may be elected if deemed necessary, based on review of backfill operations during construction.

If utility contractors indicate that it is undesirable to use compaction equipment in close proximity to a buried conduit, the contractor may elect the utilization of light weight mechanical compaction equipment and/or shading of the conduit with clean, granular material, which should be thoroughly jetted in-place above the conduit, prior to initiating mechanical compaction procedures. Other methods of utility trench compaction may also be appropriate, upon review of the geotechnical consultant at the time of construction.

In cases where clean granular materials are proposed for use in lieu of native materials or where flooding or jetting is proposed, the procedures should be considered subject to review by the geotechnical consultant. Clean granular backfill and/or bedding are not recommended in slope areas.

### Section 9 - Drainage

Where deemed appropriate by the geotechnical consultant, canyon subdrain systems should be installed in accordance with CTE's recommendations during grading.

Typical subdrains for compacted fill buttresses, slope stabilization or sidehill masses, should be installed in accordance with the specifications.

STANDARD SPECIFICATIONS OF GRADING Page 8 of 26 Roof, pad and slope drainage should be directed away from slopes and areas of structures to suitable disposal areas via non-erodible devices (i.e., gutters, downspouts, and concrete swales).

For drainage in extensively landscaped areas near structures, (i.e., within four feet) a minimum of 5 percent gradient away from the structure should be maintained. Pad drainage of at least 2 percent should be maintained over the remainder of the site.

Drainage patterns established at the time of fine grading should be maintained throughout the life of the project. Property owners should be made aware that altering drainage patterns could be detrimental to slope stability and foundation performance.

### Section 10 - Slope Maintenance

### 10.1 - Landscape Plants

To enhance surficial slope stability, slope planting should be accomplished at the completion of grading. Slope planting should consist of deep-rooting vegetation requiring little watering. Plants native to the southern California area and plants relative to native plants are generally desirable. Plants native to other semi-arid and arid areas may also be appropriate. A Landscape Architect should be the best party to consult regarding actual types of plants and planting configuration.

#### 10.2 - Irrigation

Irrigation pipes should be anchored to slope faces, not placed in trenches excavated into slope faces.

Slope irrigation should be minimized. If automatic timing devices are utilized on irrigation systems, provisions should be made for interrupting normal irrigation during periods of rainfall.

#### <u> 10.3 - Repair</u>

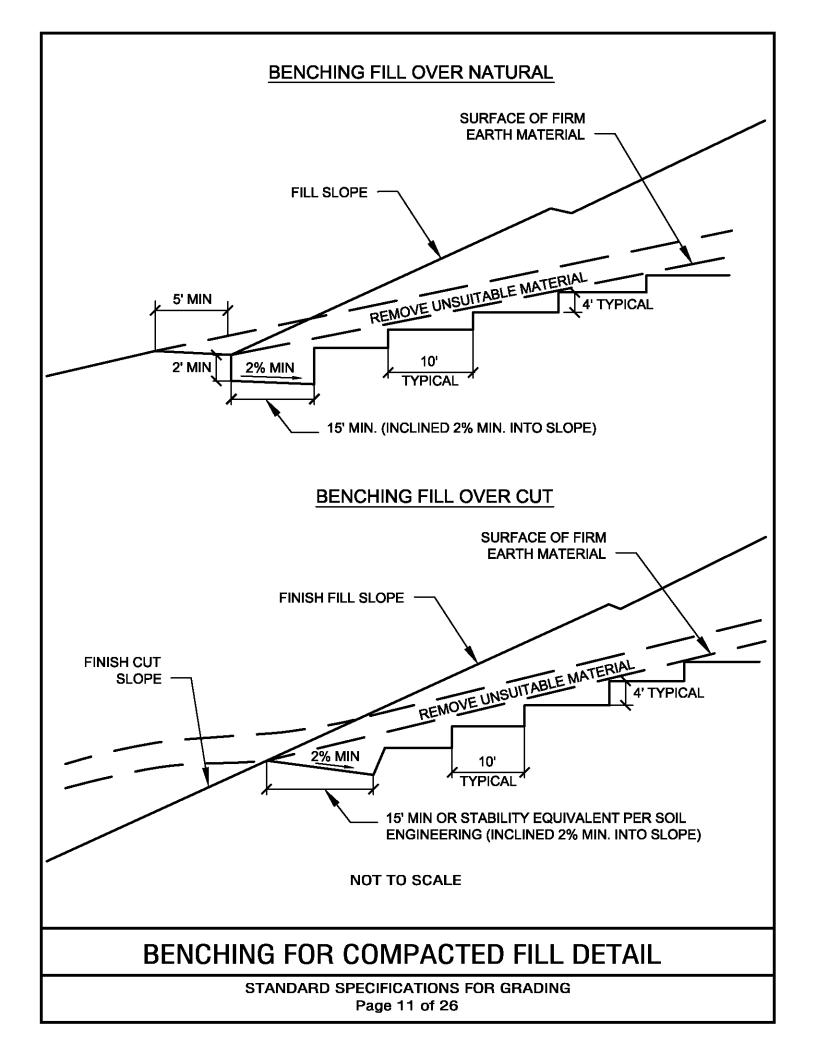

As a precautionary measure, plastic sheeting should be readily available, or kept on hand, to protect all slope areas from saturation by periods of heavy or prolonged rainfall. This measure is strongly recommended, beginning with the period prior to landscape planting.

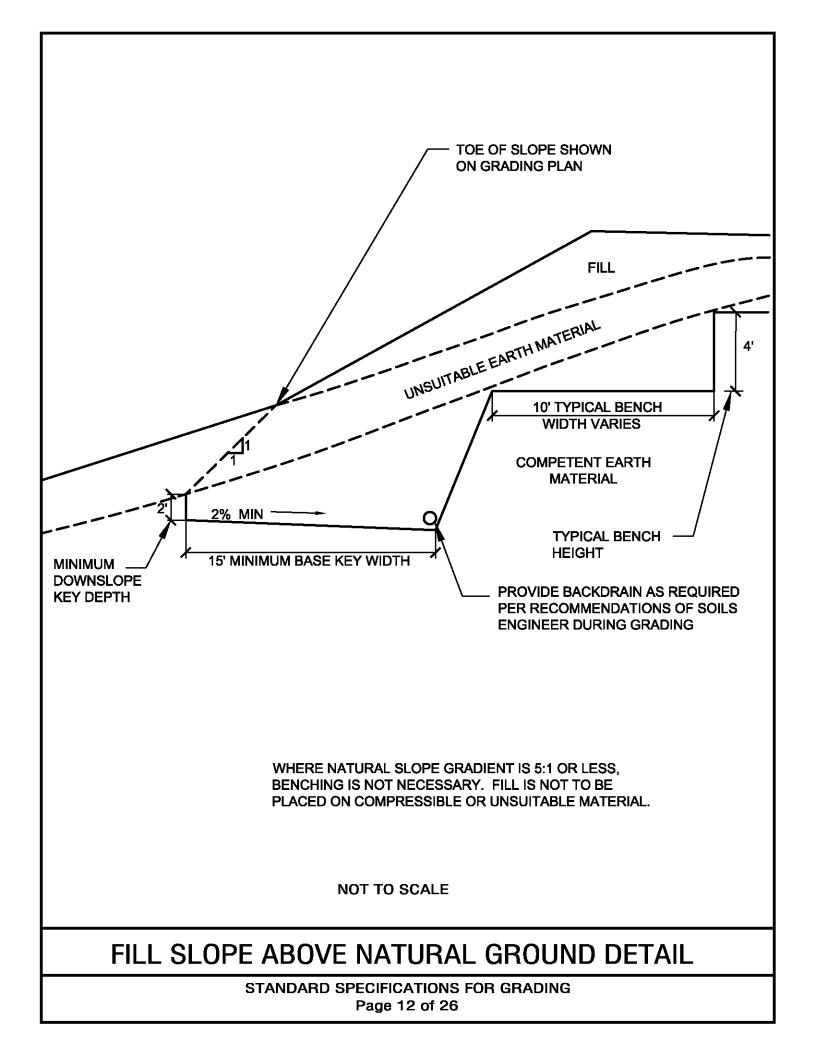

If slope failures occur, the geotechnical consultant should be contacted for a field review of site conditions and development of recommendations for evaluation and repair.

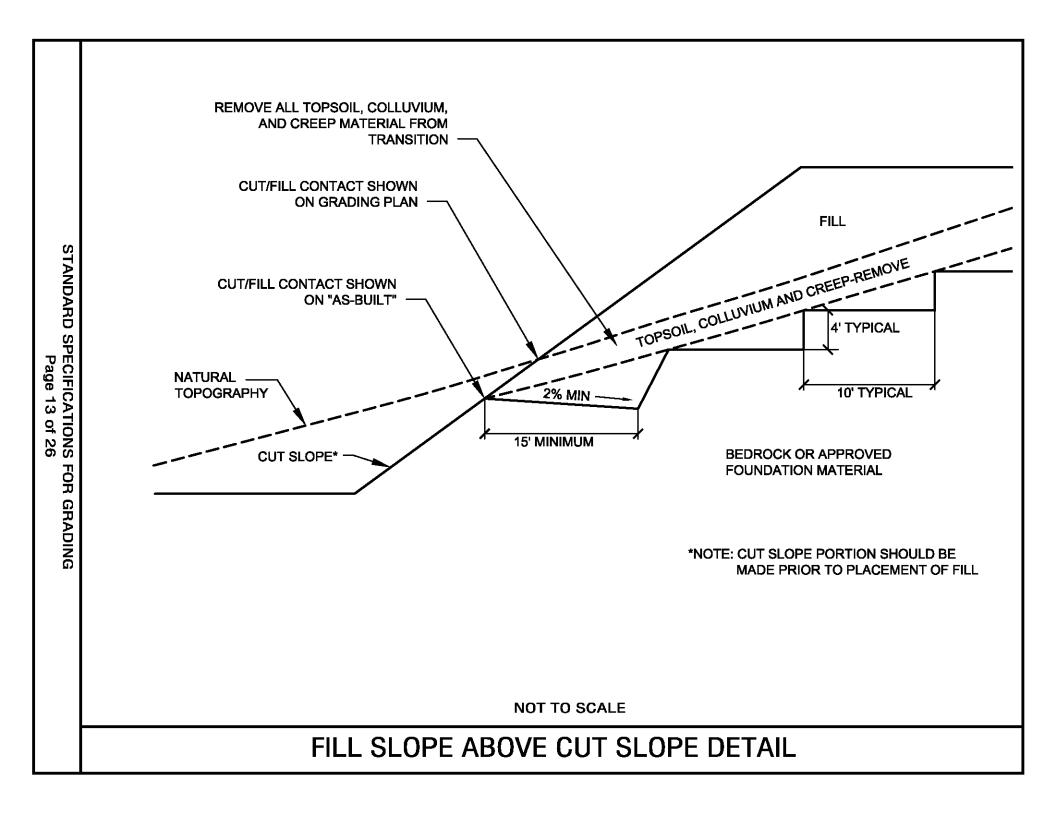

If slope failures occur as a result of exposure to period of heavy rainfall, the failure areas and currently unaffected areas should be covered with plastic sheeting to protect against additional saturation.

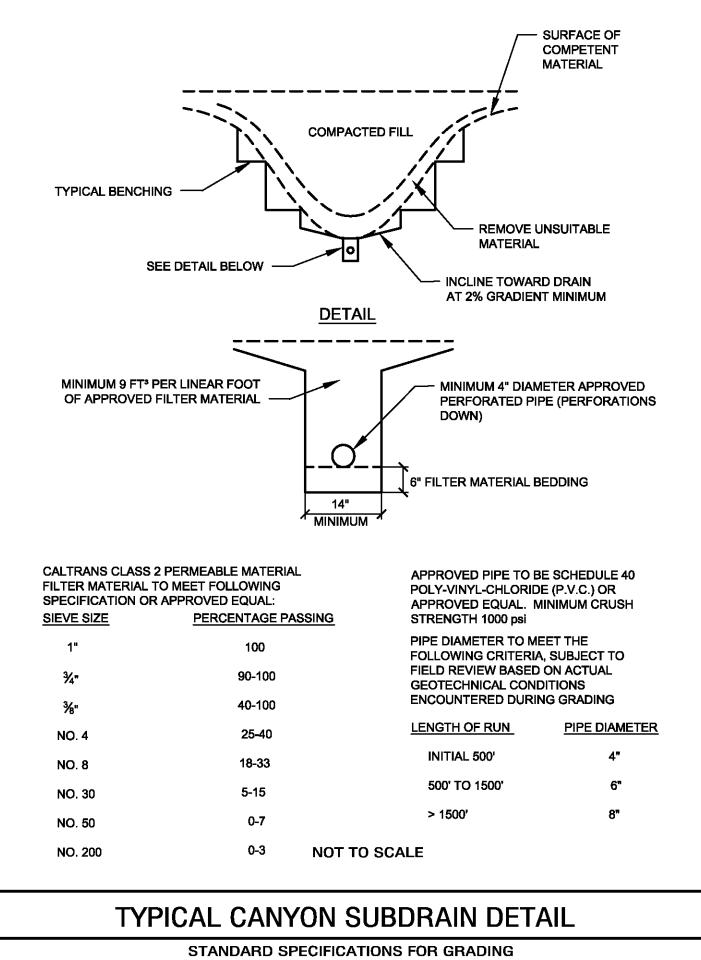

> STANDARD SPECIFICATIONS OF GRADING Page 9 of 26

In the accompanying Standard Details, appropriate repair procedures are illustrated for superficial slope failures (i.e., occurring typically within the outer one foot to three feet of a slope face).

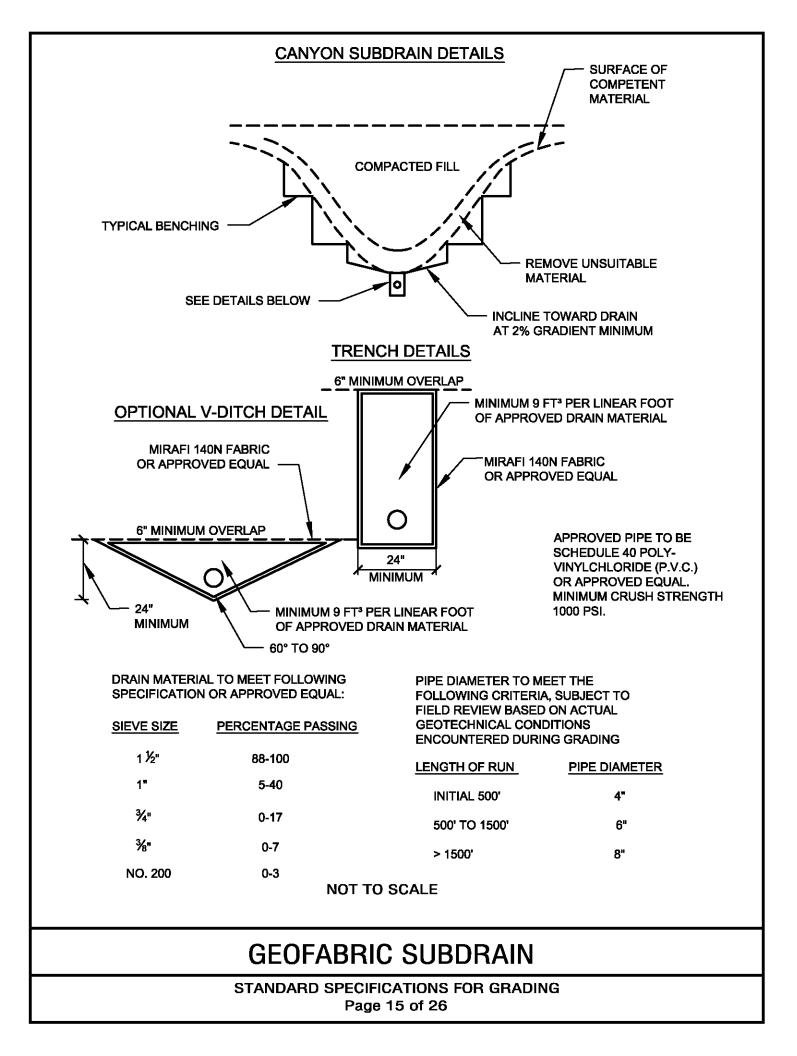

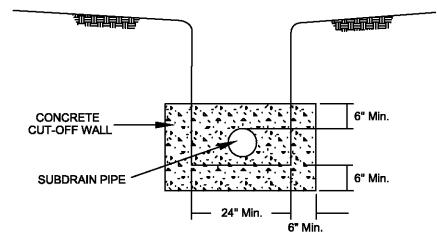

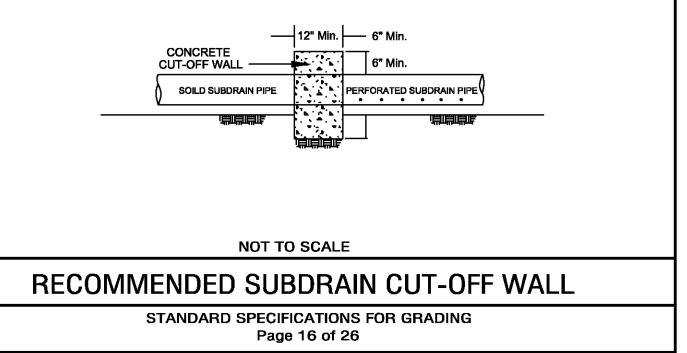

Page 14 of 26

## APPENDIX E

## C.4-1 WORKSHEET

#### APPENDIX E

#### **Percolation Methodology**

Water used to conduct the tests was supplied from an onsite water source. Weather conditions during the test were hot and sunny during both the presoaking and testing days. The percolation testing methodology was determined following the presoak period per the San Diego County guidelines. In summary, Case I conditions are determined by water remaining overnight following an initial four-hour presoak. Case II is considered a fast draining soil in which two columns of 12-14 inches of water percolate in less than 30 minutes during the second presoak period that is conducted after a minimum of 15 hours of the initial presoak period. Case III conditions result when no water remains in the test hole 15-30 hours after the initial four-hour presoak, but does not meet Case II conditions during the second presoak period. The presoak duration for all of the recent tests ranged from approximately 23 to 24 hours, which is within the SD DEH 15 to 30 hour presoak range. The approximate percolation test and boring locations are presented on Figure 2. The associated boring logs are included in Appendix B. Results of the recent percolation testing are presented in Tables E-1 through E-7 below.

#### **Calculated Infiltration Rates**

As per the City of San Diego BMP Design Manuel (January, 2018) infiltration rates are to be evaluated through the Porchet Method. The intent of the infiltration rate is to take into account bias inherent in percolation test bore hole sidewall infiltration as would not occur at a basin bottom where such sidewalls are not present.

The infiltration rate (It) is derived by the equation:

#### $I_t = \Delta H \pi r 2.60 = \Delta H 60 r$

 $\Delta t(\pi r^2 + 2\pi r H_{avg})$   $\Delta t(r + 2H_{avg})$ 

#### Where:

- It = tested infiltration rate, inches/hour
- $\Delta H$  = change in head over the time interval, inches
- $\Delta t$  = time interval, minutes
- \* r = effective radius of test hole
- Havg = average head over the time interval, inches

| Criteria 1:   | Infiltration Rate Screening  |  |  |  |  |  |
|   | Is the mapped hydrologic soil group according to the NRCS Web Soil Survey or UC Davi<br>Web Mapper Type A or B and corroborated by available site soil data <sup>1</sup> ?   |  |  |  |  |  |
|   | Yes; the DMA may feasibly support full infiltration. Answer "Yes" to Criteria 1 Result or continue to Step 1B if the applicant elects to perform infiltration testing.   |  |  |  |  |  |
| 1A  | No; the mapped soil types are A or B but is not corroborated by available site soil data (continue to Step 1B).  |  |  |  |  |  |
|   | ☑ No; the mapped soil types are C, D, or "urban/unclassified" and is corroborated by available site soil data. Answer "No" to Criteria 1 Result.   |  |  |  |  |  |
|   | □No; the mapped soil types are C, D, or "urban/unclassified" but is not corroborated by available site soil data (continue to Step 1B).  |  |  |  |  |  |
|   | Is the reliable infiltration rate calculated using planning phase methods from Table $\boxed{\checkmark}$ Yes; Continue to Step 1C.  |  |  |  |  |  |
| 1B  | □No; Skip to Step 1D.  |  |  |  |  |  |
| 1C  | Is the reliable infiltration rate calculated using planning phase methods from Table D.3-1 greater than 0.5 inches per hour?   |  |  |  |  |  |
|   | Yes; the DMA may feasibly support full infiltration. Answer "Yes" to Criteria 1 Result.  |  |  |  |  |  |
|   | ✓No; full infiltration is not required. Answer "No" to Criteria 1 Result.  |  |  |  |  |  |
| 1D  | <b>Infiltration Testing Method.</b> Is the selected infiltration testing method suitable during the design phase (see Appendix D.3)? Note: Alternative testing standards may be allowed with appropriate rationales and documentation. |  |  |  |  |  |
|   | ✓Yes; continue to Step 1E. □No; select an appropriate infiltration testing method.   |  |  |  |  |  |

#### Worksheet C.4-1: Categorization of Infiltration Feasibility Condition Based on Geotechnical Conditions<sup>9</sup>

<sup>&</sup>lt;sup>9</sup> Note that it is not required to investigate each and every criterion in the worksheet, a single "no" answer in Part 1, Part 2, Part 3, or Part 4 determines a full, partial, or no infiltration condition.
<sup>10</sup> This form must be completed each time there is a change to the site layout that would affect the infiltration feasibility condition. Previously completed forms shall be retained to document the evolution of the site storm water design.

<sup>&</sup>lt;sup>11</sup> Available data includes site-specific sampling or observation of soil types or texture classes, such as obtained from borings or test pits necessary to support other design elements.

### **Appendix C: Geotechnical and Groundwater Investigation Requirements**

|----------------------|---|--|--|--|--|
| 1E                   | Number of Percolation/Infiltration Tests. Does the infiltration testing method performed satisfy the minimum number of tests specified in Table D.3-2?<br>☐Yes; continue to Step 1F.<br>☑No; conduct appropriate number of tests.   |  |  |  |  |
| IF                   | Factor of Safety. Is the suitable Factor of Safety selected for<br>guidance in D.5; Tables D.5-1 and D.5-2; and Worksheet I<br>✓Yes; continue to Step 1G.<br>□No; select appropriate factor of safety.  | 0  |  |  |  |
| 1G                   | Full Infiltration Feasibility. Is the average measured infiltration rate divided by the Factor<br>of Safety greater than 0.5 inches per hour?<br>☐Yes; answer "Yes" to Criteria 1 Result.<br>☑No; answer "No" to Criteria 1 Result.   |  |  |  |  |
| Criteria 1<br>Result | Is the estimated reliable infiltration rate greater than 0.5 inches per hour within the DMA<br>where runoff can reasonably be routed to a BMP?<br>Yes; the DMA may feasibly support full infiltration. Continue to Criteria 2.<br>No; full infiltration is not required. Skip to Part 1 Result. |  |  |  |  |

Summarize infiltration testing methods, testing locations, replicates, and results and summarize estimates of reliable infiltration rates according to procedures outlined in D.5. Documentation should be included in project geotechnical report.

As the project development is in initial design phase, specific potential BMP locations have not been finalized. As such, we conducted percolation test borings such that the entire site would be accurately characterized in terms of infiltration potential. Borehole percolation tests were completed in accordance with Couty of San Diego Department of Environmental Health (DEH), Version 2010 guidelines. The derived percolation rates were then converted to infiltration rates following the procedures of the Prochet Method, as recommended by the BMP Design Manual, Appendix D (February, 2018). In total, seven percolation tests borings were advanced over the subject site. All percolation tests met Case 1 criteria, and were converted to infiltration rates. All infiltation rates were below the lower boundary rate for partial infiltration prior to appling a Safety factor of two to the results. As such, the site is classified as a "No Infiltration Condition" based on Class D type NCRS soil types that were confiremd by logs of borings and infiltration rates below 0.05 inches per hour.

However, there were no other geologic-geotechnical conditions with managable mitigation levels that would prohibited infiltration provided conformance with all structural setback criteria as defined in Appendix C of the City of San Diego BMP Design Manuel (January 2018) is ahered to. With the possible exception of expansive soils with Expansion Index values greater than 20.

# Appendix C: Geotechnical and Groundwater Investigation Requirements

| Categorization of Infiltration Feasibility Condition based on Worksheet<br>Geotechnical Conditions |  |               | t C.4-1: Form I-<br>8A <sup>10</sup> |     |  |  |  |  |
|--|--|---------------|--------------------------------------|-----|--|--|--|--|
| Criteria 2: Geologic/Geotechnical Screening  |  |               |                                      |     |  |  |  |  |
|  | If all questions in Step 2A are answered "Yes," continue to Step 2B.   |               |                                      |     |  |  |  |  |
| 2A   | For any "No" answer in Step 2A answer "No" to Criteria 2, and submit an "Infiltration Feasibility Condition Letter" that meets the requirements in Appendix C.1.1. The geologic/geotechnical analyses listed in Appendix C.2.1 do not apply to the DMA because one of the following setbacks cannot be avoided and therefore result in the DMA being in a no infiltration condition. The setbacks must be the closest horizontal radial distance from the surface edge (at the overflow elevation) of the BMP. |               |                                      |     |  |  |  |  |
| 2A-1   | Can the proposed full infiltration BMP(s) avoid areas with<br>materials greater than 5 feet thick below the infiltrating su  | √Yes          | □No                                  |     |  |  |  |  |

| Criteria 2<br>Result | Can infiltration greater than 0.5 inches per hour be allowed with<br>increasing risk of geologic or geotechnical hazards that cannot<br>reasonably mitigated to an acceptable level?  |  | ∐Yes                           | √No  |

Summarize findings and basis; provide references to related reports or exhibits.

As discussed in the Geotechnical Preliminary Report, dated April 23, 2018 (attached), the site is classified as "No Infiltration condition base on NCRS soil type D and low infiltration rates below 0.05 inches per hour. However, there are no other geologic - geotechnical conditions that are considered non feasible for infiltration provided reasonable mitigation measures are employed and structural setback criteria are adhered to. With the possible exception of expansive soils with Expansion Index values greater than 20.

As the project development is in initial design phase, specific potential BMP locations have not been finalized. As such, we conducted percolation test borings such that the entire site would be accurately characterized in terms of infiltration potential. Borehole percolation tests were completed in accordance with County of San Diego Department of Environmental Health (DEH), Version 2010 guidelines. The derived percolation rates were then converted to infiltration rates following the procedures of the Prochet Method, as recommended by the BMP Design Manual, Appendix D (February, 2018). In total, seven percolation test borings were advanced over the subject site. All percolation tests met Case 1 criteria, and were converted to infiltration rates. All infiltation rates were below the lower boundary rate for partial infiltration prior to appling a Safety factor of two to the results. As such, the site is classified as a "No Infiltration Condition" based on Class D type NCRS soil types that were confiremd by logs of borings and infiltration rates below 0.05 inches per hour.

| Part 1 Result – Full Infiltration Geotechnical Screening <sup>12</sup>  | Result |
|---|--------|
| If answers to both Criteria 1 and Criteria 2 are "Yes", a full<br>infiltration design is potentially feasible based on Geotechnical<br>conditions only.<br>If either answer to Criteria 1 or Criteria 2 is "No", a full infiltration<br>design is not required. |        |
|   |        |

# **Certification Page**

### Project Name: Permit Application

I hereby declare that I am the Engineer in Responsible Charge of design of storm water BMPs for this project, and that I have exercised responsible charge over the design of the project as defined in Section 6703 of the Business and Professions Code, and that the design is consistent with the requirements of the Storm Water Standards, which is based on the requirements of SDRWQCB Order No. R9-2013-0001 as amended by R9-2015-0001 and R9-2015-0100 (MS4 Permit).

I have read and understand that the City Engineer has adopted minimum requirements for managing urban runoff, including storm water, from land development activities, as described in the Storm Water Standards. I certify that this PDP SWQMP has been completed to the best of my ability and accurately reflects the project being proposed and the applicable source control and site design BMPs proposed to minimize the potentially negative impacts of this project's land development activities on water quality. I understand and acknowledge that the plan check review of this PDP SWQMP by the City Engineer is confined to a review and does not relieve me, as the Engineer in Responsible Charge of design of storm water BMPs for this project, of my responsibilities for project design.

<u>Остовек</u> 2016

Project Address:

#### **SECTION 1. Construction Storm Water BMP Requirements:**

All construction sites are required to implement construction BMPs in accordance with the performance standards in the <u>Storm Water Standards Manual</u>. Some sites are additionally required to obtain coverage under the State Construction General Permit (CGP)<sup>1</sup>, which is administered by the State Water Resources Control Board.

# For all projects complete PART A: If project is required to submit a SWPPP or WPCP, continue to PART B.

| PART A: Determine Construction Phase Storm Water Requirements.  |
|---|
| I. Is the project subject to California's statewide General NPDES permit for Storm Water Discharges Associated<br>with Construction Activities, also known as the State Construction General Permit (CGP)? (Typically projects with |
| land disturbance greater than or equal to 1 acre.)  |

□ Yes; SWPPP required, skip questions 2-4 □ No; next question

2. Does the project propose construction or demolition activity, including but not limited to, clearing, grading, grubbing, excavation, or any other activity resulting in ground disturbance and contact with storm water runoff?

Yes; WPCP required, skip 3-4

3. Does the project propose routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of the facility? (Projects such as pipeline/utility replacement)

Yes; WPCP required, skip 4

No; next question

No; next guestion

4. Does the project only include the following Permit types listed below?

- Electrical Permit, Fire Alarm Permit, Fire Sprinkler Permit, Plumbing Permit, Sign Permit, Mechanical Permit, Spa Permit.
- Individual Right of Way Permits that exclusively include only ONE of the following activities: water service, sewer lateral, or utility service.
- Right of Way Permits with a project footprint less than 150 linear feet that exclusively include only ONE of the following activities: curb ramp, sidewalk and driveway apron replacement, pot holing, curb and gutter replacement, and retaining wall encroachments.

Yes; no document required

Check one of the boxes below, and continue to PART B:

| If you checked "Yes" for a SWPPP is REQUIRED. | question 1,<br><b>Continue to PART B</b> |
|---|--|
| -   |  |

| If you checked "No" for guestion 1, and checked "Yes" for guestion 2 or 3,  |
|---|
| <b>a WPCP is REQUIRED.</b> If the project proposes less than 5,000 square feet of ground disturbance AND has less than a 5-foot elevation change over the entire project area, a Minor WPCP may be required instead. <b>Continue to PART B.</b> |
| of ground disturbance AND has less than a 5-foot elevation change over the  |
| entire project area, a Minor WPCP may be required instead. <b>Continue to PART B.</b>   |

# Form I-3B Page 3 of 11 Description of Existing Site Topography and Drainage How is storm water runoff conveyed from the site? At a minimum, this description should answer: Whether existing drainage conveyance is natural or urban; 1. 2. If runoff from offsite is conveyed through the site? If yes, quantification of all offsite drainage areas, design flows, and locations where offsite flows enter the project site and summarize how such flows are conveyed through the site; Provide details regarding existing project site drainage conveyance network, including 3. storm drains, concrete channels, swales, detention facilities, storm water treatment facilities, and natural and constructed channels; Identify all discharge locations from the existing project along with a summary of the 4. conveyance system size and capacity for each of the discharge locations. Provide summary of the pre-project drainage areas and design flows to each of the existing runoff discharge locations. **Descriptions/Additional Information**

## Form I-3B Page 5 of 11

Does the project include changes to site drainage (e.g., installation of new storm water conveyance systems)?

- 🗆 Yes
- □ No

If yes, provide details regarding the proposed project site drainage conveyance network, including storm drains, concrete channels, swales, detention facilities, storm water treatment facilities, natural and constructed channels, and the method for conveying offsite flows through or around the proposed project site. Identify all discharge locations from the proposed project site along with a summary of the conveyance system size and capacity for each of the discharge locations. Provide a summary of pre and post-project drainage areas and design flows to each of the runoff discharge locations. Reference the drainage study for detailed calculations.

Description / Additional Information:

# Form I-3B Page 6 of 11

Identify whether any of the following features, activities, and/or pollutant source areas will be

present (select all that apply):

Onsite storm drain inlets

 $\hfill\square$  Interior floor drains and elevator shaft sump pumps

Interior parking garages

 $\hfill\square$  Need for future indoor & structural pest control

□ Landscape/outdoor pesticide use

 $\hfill\square$  Pools, spas, ponds, decorative fountains, and other water features

 $\square$  Food service

Refuse areas

Industrial processes

□ Outdoor storage of equipment or materials

□ Vehicle and equipment cleaning

□ Vehicle/equipment repair and maintenance

Fuel dispensing areas

 $\hfill\square$  Loading docks

□ Fire sprinkler test water

□ Miscellaneous drain or wash water

 $\hfill\square$  Plazas, sidewalks, and parking lots

# Form I-3B Page 9 of 11

| Hydromodification Management Requirements   |
|---|
| Do hydromodification management requirements apply (see Section 1.6)?                                     |
| Yes, hydromodification management flow control structural BMPs required.                                  |
| $\square$ No, the project will discharge runoff directly to existing underground storm drains discharging |
| directly to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean.                   |
| $\square$ No, the project will discharge runoff directly to conveyance channels whose bed and bank are    |
| concrete-lined all the way from the point of discharge to water storage reservoirs, lakes, enclosed       |
| embayments, or the Pacific Ocean.   |
| □ No, the project will discharge runoff directly to an area identified as appropriate for an exemption    |
| by the WMAA for the watershed in which the project resides.   |
| Description / Additional Information (to be provided if a 'No' answer has been selected above):           |
|   |
|   |
|   |

| Flow Control for Post-Project Runoff*  |
| *This Section only required if hydromodification management requirements apply   |
| List and describe point(s) of compliance (POCs) for flow control for hydromodification management<br>(see Section 6.3.1). For each POC, provide a POC identification name or number correlating to the<br>project's HMP Exhibit and a receiving channel identification name or number correlating to the<br>project's HMP Exhibit. |
|  |
| Has a geomorphic assessment been performed for the receiving channel(s)?   |
| <ul> <li>No, the low flow threshold is 0.1Q<sub>2</sub> (default low flow threshold)</li> <li>Yes, the result is the low flow threshold is 0.1Q<sub>2</sub></li> </ul>   |
| $\Box$ Yes, the result is the low flow threshold is $0.3Q_2$   |
| $\Box$ Yes, the result is the low flow threshold is $0.5Q_2$   |
| If a geomorphic assessment has been performed, provide title, date, and preparer:  |
| Discussion / Additional Information: (optional)  |
|  |

# Form I-3B Page 11 of 11 Other Site Requirements and Constraints When applicable, list other site requirements or constraints that will influence storm water management design, such as zoning requirements including setbacks and open space, or local codes governing minimum street width, sidewalk construction, allowable pavement types, and drainage requirements. Optional Additional Information or Continuation of Previous Sections As Needed This space provided for additional information or continuation of information from previous sections as needed.

| Source Control BMP Checklist<br>for PDPs  | F                                       | Form I-4                            | B                 |  |  |

Discussion / justification if 4.2.6 not implemented. Clearly identify which sources of runoff pollutants are discussed. Justification must be provided for <u>all</u> "No" answers shown above.

| Site Design BMP Checklist<br>for PDPs  | F           | Form I-5     | В              |  |  |
|--|-------------|--------------|----------------|--|--|
| Site Design BMPs   |             |              |                |  |  |
| Site Design BMPs         All development projects must implement site design BMPs where applicable and feasible. See         Chapter 4 and Appendix E of the BMP Design Manual (Part 1 of Storm Water Standards) for         information to implement site design BMPs shown in this checklist.         Answer each category below pursuant to the following.         • "Yes" means the project will implement the site design BMP as described in Chapter 4 and/or         Appendix E of the BMP Design Manual. Discussion / justification is not required.         • "No" means the BMP is applicable to the project but it is not feasible to implement.         Discussion / justification must be provided.         • "N/A" means the BMP is not applicable at the project site because the project does not include the feature that is addressed by the BMP (e.g., the project site has no existing natural areas to conserve). Discussion / justification may be provided. |             |              |                |  |  |

## Summary of PDP Structural BMPs Form I-6 PDP Structural BMPs

All PDPs must implement structural BMPs for storm water pollutant control (see Chapter 5 of the BMP Design Manual, Part 1 of Storm Water Standards). Selection of PDP structural BMPs for storm water pollutant control must be based on the selection process described in Chapter 5. PDPs subject to hydromodification management requirements must also implement structural BMPs for flow control for hydromodification management (see Chapter 6 of the BMP Design Manual). Both storm water pollutant control and flow control for hydromodification management can be achieved within the same structural BMP(s).

PDP structural BMPs must be verified by the City at the completion of construction. This includes requiring the project owner or project owner's representative to certify construction of the structural BMPs (complete Form DS-563). PDP structural BMPs must be maintained into perpetuity (see Chapter 7 of the BMP Design Manual).

Use this form to provide narrative description of the general strategy for structural BMP implementation at the project site in the box below. Then complete the PDP structural BMP summary information sheet (page 3 of this form) for each structural BMP within the project (copy the BMP summary information page as many times as needed to provide summary information for each individual structural BMP).

Describe the general strategy for structural BMP implementation at the site. This information must describe how the steps for selecting and designing storm water pollutant control BMPs presented in Section 5.1 of the BMP Design Manual were followed, and the results (type of BMPs selected). For projects requiring hydromodification flow control BMPs, indicate whether pollutant control and flow control BMPs are integrated or separate.

(Continue on page 2 as necessary.)

NOTE THAT PAVEMENT<br>SUBBASE MAY BE A PART OF THE 'C' LAYER. | GRANULAR WELL-GRADED SOIL/AGGREGATE MIXTURES, <35%<br>FINES OR PROCESSED AGGREGATE.<br>MOST PAVEMENT SUBBASE MATERIALS CAN BE USED IN LIEU<br>OF THIS LAYER. | AASHTO M145 <sup>1</sup><br>A-1, A-2-4, A-3<br>OR<br>AASHTO M43 <sup>1</sup><br>3, 357, 4, 467, 5, 56, 57, 6, 67, 68, 7, 78, 8, 89,<br>9, 10 | BEGIN COMPACTIONS AFTER 24" (<br>MATERIAL OVER THE CHAMBERS IS<br>COMPACT ADDITIONAL LAYERS IN<br>MAX LIFTS TO A MIN. 95% PROCTOR<br>WELL GRADED MATERIAL AND 95%<br>DENSITY FOR PROCESSED AGO<br>MATERIALS. |
| В | EMBEDMENT STONE: FILL SURROUNDING THE<br>CHAMBERS FROM THE FOUNDATION STONE ('A'<br>LAYER) TO THE 'C' LAYER ABOVE.  | CLEAN, CRUSHED, ANGULAR STONE, NOMINAL SIZE<br>DISTRIBUTION BETWEEN 3/4-2 INCH (20-50 mm)  | AASHTO M43 <sup>1</sup><br>3, 4  | NO COMPACTION REQUIR   |
| A | FOUNDATION STONE: FILL BELOW CHAMBERS<br>FROM THE SUBGRADE UP TO THE FOOT (BOTTOM)<br>OF THE CHAMBER.   | CLEAN, CRUSHED, ANGULAR STONE, NOMINAL SIZE<br>DISTRIBUTION BETWEEN 3/4-2 INCH (20-50 mm)  | AASHTO M43 <sup>1</sup><br>3, 4  | PLATE COMPACT OR ROLL TO ACH<br>SURFACE. <sup>2 3</sup>  |

PLEASE NOTE:

1. THE LISTED AASHTO DESIGNATIONS ARE FOR GRADATIONS ONLY. THE STONE MUST ALSO BE CLEAN, CRUSHED, ANGULAR. FOR EXAMPLE, A SPECIFICATION FOR #4 STONE WOULD STATE: "CLEAN, CRU ANGULAR NO. 4 (AASHTO M43) STONE".

2. STORMTECH COMPACTION REQUIREMENTS ARE MET FOR 'A' LOCATION MATERIALS WHEN PLACED AND COMPACTED IN 9" (230 mm) (MAX) LIFTS USING TWO FULL COVERAGES WITH A VIBRATORY COMPA

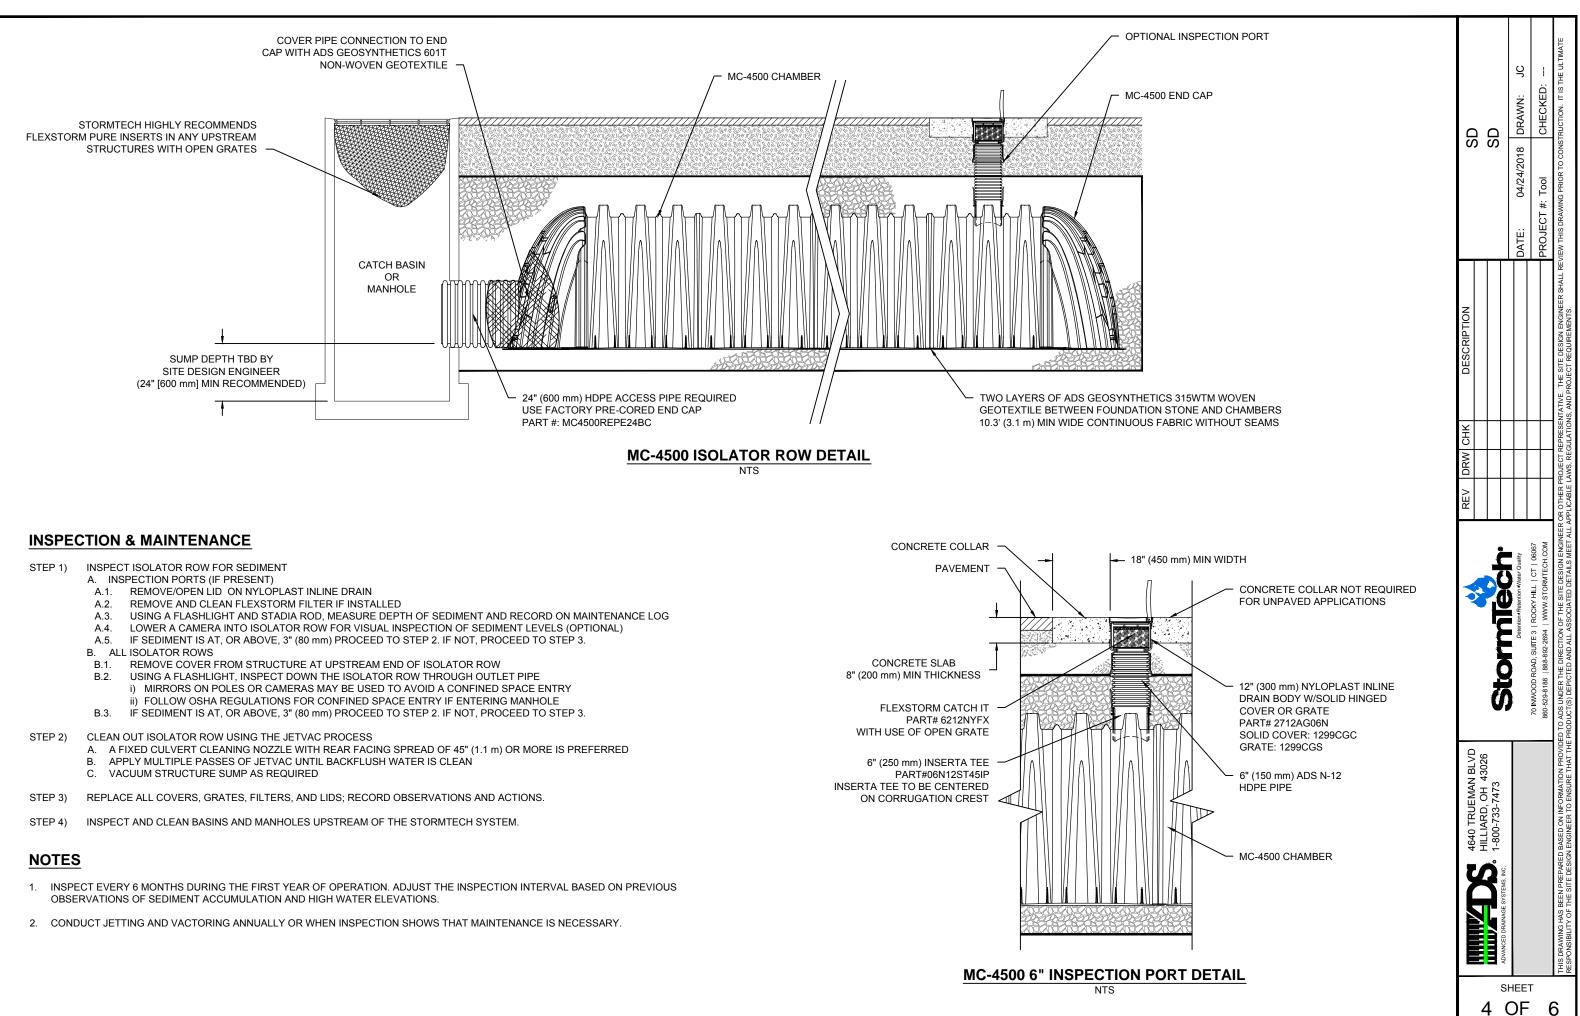

3. WHERE INFILTRATION SURFACES MAY BE COMPROMISED BY COMPACTION, FOR STANDARD DESIGN LOAD CONDITIONS, A FLAT SURFACE MAY BE ACHIEVED BY RAKING OR DRAGGING WITHOUT COMPA EQUIPMENT. FOR SPECIAL LOAD DESIGNS, CONTACT STORMTECH FOR COMPACTION REQUIREMENTS.

### NOTES:

- 1. MC-4500 CHAMBERS SHALL CONFORM TO THE REQUIREMENTS OF ASTM F2418 "STANDARD SPECIFICATION FOR POLYPROPYLENE (PP) CORRUGATED WALL STORMWATER COLLECTION CHAMBERS".
- 2. MC-4500 CHAMBERS SHALL BE DESIGNED IN ACCORDANCE WITH ASTM F2787 "STANDARD PRACTICE FOR STRUCTURAL DESIGN OF THERMOPLASTIC CORRUGATED WALL STORMWATER COLLECTION CHAMBERS".
- 3. "ACCEPTABLE FILL MATERIALS" TABLE ABOVE PROVIDES MATERIAL LOCATIONS, DESCRIPTIONS, GRADATIONS, AND COMPACTION REQUIREMENTS FOR FOUNDATION, EMBEDMENT, AND FILL MATERIALS.
- 4. THE "SITE DESIGN ENGINEER" REFERS TO THE ENGINEER RESPONSIBLE FOR THE DESIGN AND LAYOUT OF THE STORMTECH CHAMBERS FOR THIS PROJECT.
- 5. THE SITE DESIGN ENGINEER IS RESPONSIBLE FOR ASSESSING THE BEARING RESISTANCE (ALLOWABLE BEARING CAPACITY) OF THE SUBGRADE SOILS AND THE DEPTH OF FOUNDATION STONE WITH CONSIDERATION FOR THE RANGE OF EXPECTED SOIL MOISTURE CONDITIONS.
- 6. PERIMETER STONE MUST BE EXTENDED HORIZONTALLY TO THE EXCAVATION WALL FOR BOTH VERTICAL AND SLOPED EXCAVATION WALLS.
- 7. ONCE LAYER 'C' IS PLACED, ANY SOIL/MATERIAL CAN BE PLACED IN LAYER 'D' UP TO THE FINISHED GRADE. MOST PAVEMENT SUBBASE SOILS CAN BE USED TO REPLACE THE MATERIAL REQUIREMENTS OF LAYER 'C' OR 'D' AT THE SITE DESIGN ENGINEER'S DISCRETION.

# Use this checklist to ensure the required information has been included on the DMA Exhibit:

The DMA Exhibit must identify:

Underlying hydrologic soil group Approximate depth to groundwater Existing natural hydrologic features (watercourses, seeps, springs, wetlands) (NA) Critical coarse sediment yield areas to be protected (NA) Existing topography and impervious areas Existing and proposed site drainage network and connections to drainage offsite Proposed grading Proposed impervious features Proposed design features and surface treatments used to minimize imperviousness Drainage management area (DMA) boundaries, DMA ID numbers, and DMA areas (square footage or acreage), and DMA type (i.e., drains to BMP, selfretaining, or self-mitigating) Potential pollutant source areas and corresponding required source controls (see Chapter 4, Appendix E.1, and Form I-3B) Structural BMPs (identify location, type of BMP, size/detail, and include crosssection)

| Criteria 1<br>Result | No. the DMA wave for the sum out full infiltmetice. Continue to Oritania a   |  |  |  |  |  |

Summarize infiltration testing methods, testing locations, replicates, and results and summarize estimates of reliable infiltration rates according to procedures outlined in D.5. Documentation should be included in project geotechnical report.

As the project development is in initial design phase, specific potential BMP locations have not been finalized. As such, we conducted percolation test borings such that the entire site would be accurately characterized in terms of infiltration potential. Borehole percolation tests were completed in accordance with Couty of San Diego Department of Environmental Health (DEH), Version 2010 guidelines. The derived percolation rates were then converted to infiltration rates following the procedures of the Prochet Method, as recommended by the BMP Design Manual, Appendix D (February, 2018). In total, seven percolation tests borings were advanced over the subject site. All percolation tests met Case 1 criteria, and were converted to infiltration rates. All infiltation rates were below the lower boundary rate for partial infiltration prior to appling a Safety factor of two to the results. As such, the site is classified as a "No Infiltration Condition" based on Class D type NCRS soil types that were confiremd by logs of borings and infiltration rates below 0.05 inches per hour.

However, there were no other geologic-geotechnical conditions with managable mitigation levels that would prohibited infiltration provided conformance with all structural setback criteria as defined in Appendix C of the City of San Diego BMP Design Manuel (January 2018) is ahered to. With the possible exception of expansive soils with Expansion Index values greater than 20.

Summarize findings and basis; provide references to related reports or exhibits.

As discussed in the Geotechnical Preliminary Report, dated April 23, 2018 (attached), the site is classified as "No Infiltration condition base on NCRS soil type D and low infiltration rates below 0.05 inches per hour. However, there are no other geologic - geotechnical conditions that are considered non feasible for infiltration provided reasonable mitigation measures are employed and structural setback criteria are adhered to. With the possible exception of expansive soils with Expansion Index values greater than 20.

As the project development is in initial design phase, specific potential BMP locations have not been finalized. As such, we conducted percolation test borings such that the entire site would be accurately characterized in terms of infiltration potential. Borehole percolation tests were completed in accordance with County of San Diego Department of Environmental Health (DEH), Version 2010 guidelines. The derived percolation rates were then converted to infiltration rates following the procedures of the Prochet Method, as recommended by the BMP Design Manual, Appendix D (February, 2018). In total, seven percolation test borings were advanced over the subject site. All percolation tests met Case 1 criteria, and were converted to infiltration rates. All infiltation rates were below the lower boundary rate for partial infiltration prior to appling a Safety factor of two to the results. As such, the site is classified as a "No Infiltration Condition" based on Class D type NCRS soil types that were confiremd by logs of borings and infiltration rates below 0.05 inches per hour.

Linscott, Law & Greenspan, Engineers 4542 Ruffner Street Suite 100 San Diego, CA 92111 858.300.8800 T 858.300.8810 F www.llgengineers.com

## **EXECUTIVE SUMMARY**

Linscott, Law & Greenspan, Engineers (LLG) has prepared the following transportation impact study to determine and evaluate the transportation impacts on the local circulation system due to the repurposing of an existing office building with the proposed Aero Drive Veterans Affairs Facility project (proposed "Project") in the Kearny Mesa Community of the City of San Diego. The project site currently contains a 113,981 SF office building. The Project proposes to repurpose and expand the existing building to provide a 138,915 SF Veterans Affairs Hospital Annex.

The project is calculated to generate 5,082 driveway ADT with 175 additional AM peak hour trips (115 inbound/60 outbound) and 434 additional PM peak hour trips (156 inbound trips/278 outbound). The total cumulative trip generation for the project is 359 cumulative ADT with 109 fewer AM peak hour trips (111 fewer inbound trips/2 additional outbound) and 39 fewer PM peak hour trips (15 additional inbound trips/54 fewer outbound trips).

The project would result in a significant traffic impact at the intersection of Aero Drive/Sandrock Road under the Existing + Project and Long-Term (Year 2035) Project conditions. It is recommended that the Project reconfigure the northbound and southbound approaches, currently controlled with split signal phasing, to provide protected signal phasing. The northbound approach would be restriped to provide two dedicated left-turn lanes and a shared thru / right-turn lane. Modifications to the southbound approach include replacing the existing 9' center raised median with a 4' raised median and restriping to provide a shared thru / right-turn lane, a 10' painted median with chevron markings and a dedicated left-turn lane.

#### **TRANSPORTATION IMPACT ANALYSIS**

## **AERO DRIVE VETERANS AFFAIRS FACILITY**

San Diego, California November 29, 2018

#### 1.0 INTRODUCTION

The following transportation impact study has been prepared to determine and evaluate the transportation impacts on the local circulation system due to the repurposing of an existing office building with the proposed Aero Drive Veterans Affairs Facility project (proposed "Project") in the Kearny Mesa Community of the City of San Diego. The purpose of this study is to assess the potential impacts to the local circulation system as a result of the Project.

Included in this traffic study are the following:

- Project Description
- Existing Conditions Discussion
- Study Area, Analysis Approach & Methodology
- Significance Criteria
- Analysis of Existing Conditions
- Trip Generation, Distribution & Assignment
- Analysis of Existing + Project Scenario
- Near-Term (Opening Year 2020) Analysis
- Near-Term (Opening Year 2020) + Project Analysis
- Horizon Year (Year 2035) Analysis
- Horizon Year (Year 2035) + Project Analysis
- Access and On-Site Circulation Assessment
- Parking Discussion
- Transportation Demand Management Discussion
- Significance of Impacts and Mitigation Measures

# 2.0 PROJECT DESCRIPTION

## 2.1 Project Location

The Project is located at 8875 Aero Drive between Interstate 805 and Interstate 15 within the Kearny Mesa Community of the City of San Diego.

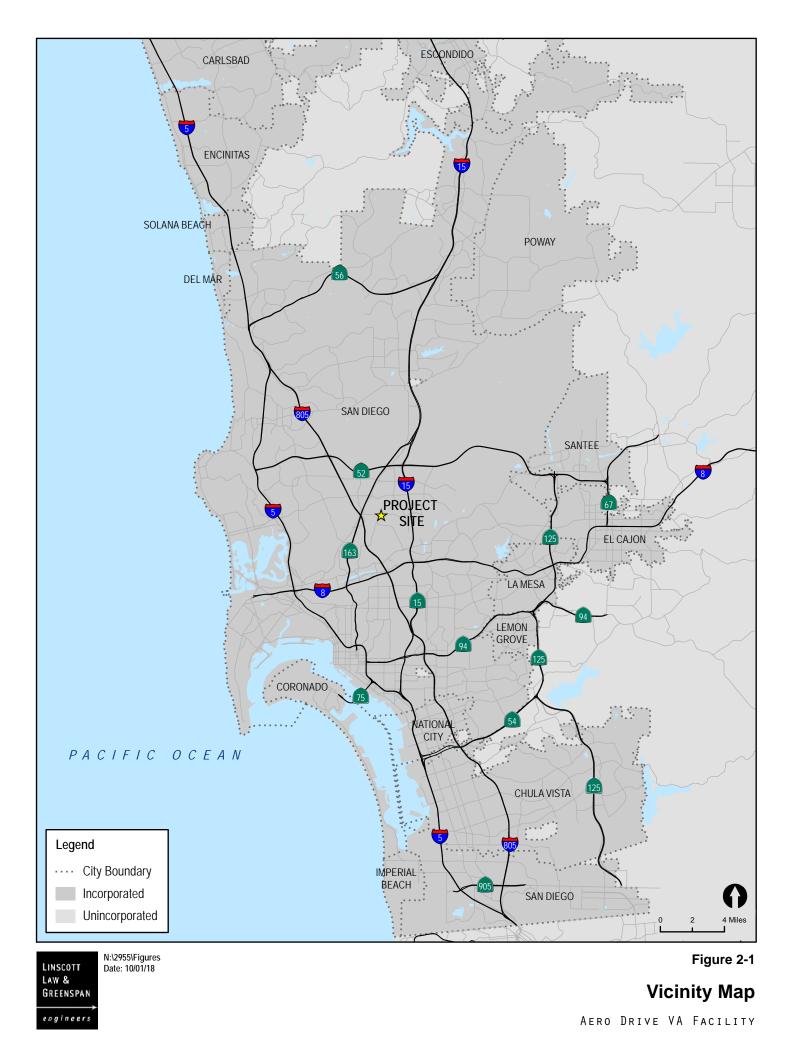

Figure 2–1 shows the vicinity map. Figure 2–2 shows a more detailed Project area map.

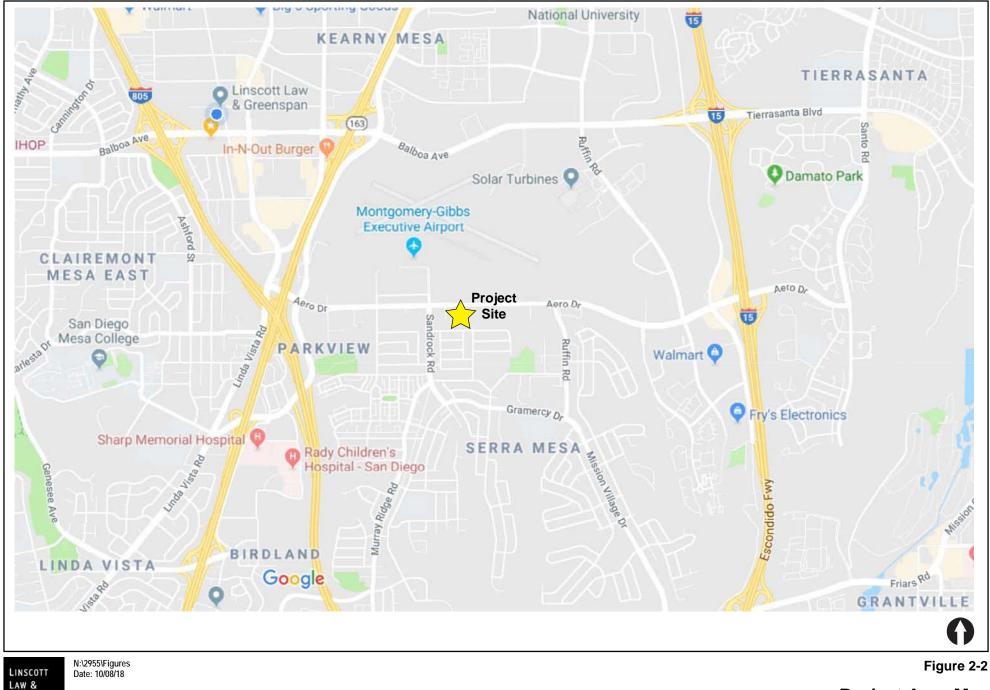

### 2.2 Project Description

The Project proposes the repurposing of an existing office building. The project site currently contains a 113,981 SF office building. The Project proposes to repurpose and expand the existing building to provide a 138,915 SF Veterans Affairs Hospital Annex. The project requires a City of San Diego Process Four, Conditional Use Permit for a Hospital Annex facility.

Access to the site will continue to be primarily from Aero Drive, with one existing driveway being closed. The Project will construct a raised median along its frontage, connecting to the existing median to the west of the Project site, in order to satisfy the City's Major Roadway requirements A median break will be provided to allow for left-turns into the site. Left-turns out of the site will be prohibited. The Project site has a legal easement to access Sandrock Road thru the contiguous properties to the west. Therefore, a portion of the Project trips were assumed to exit via Sandrock Road.

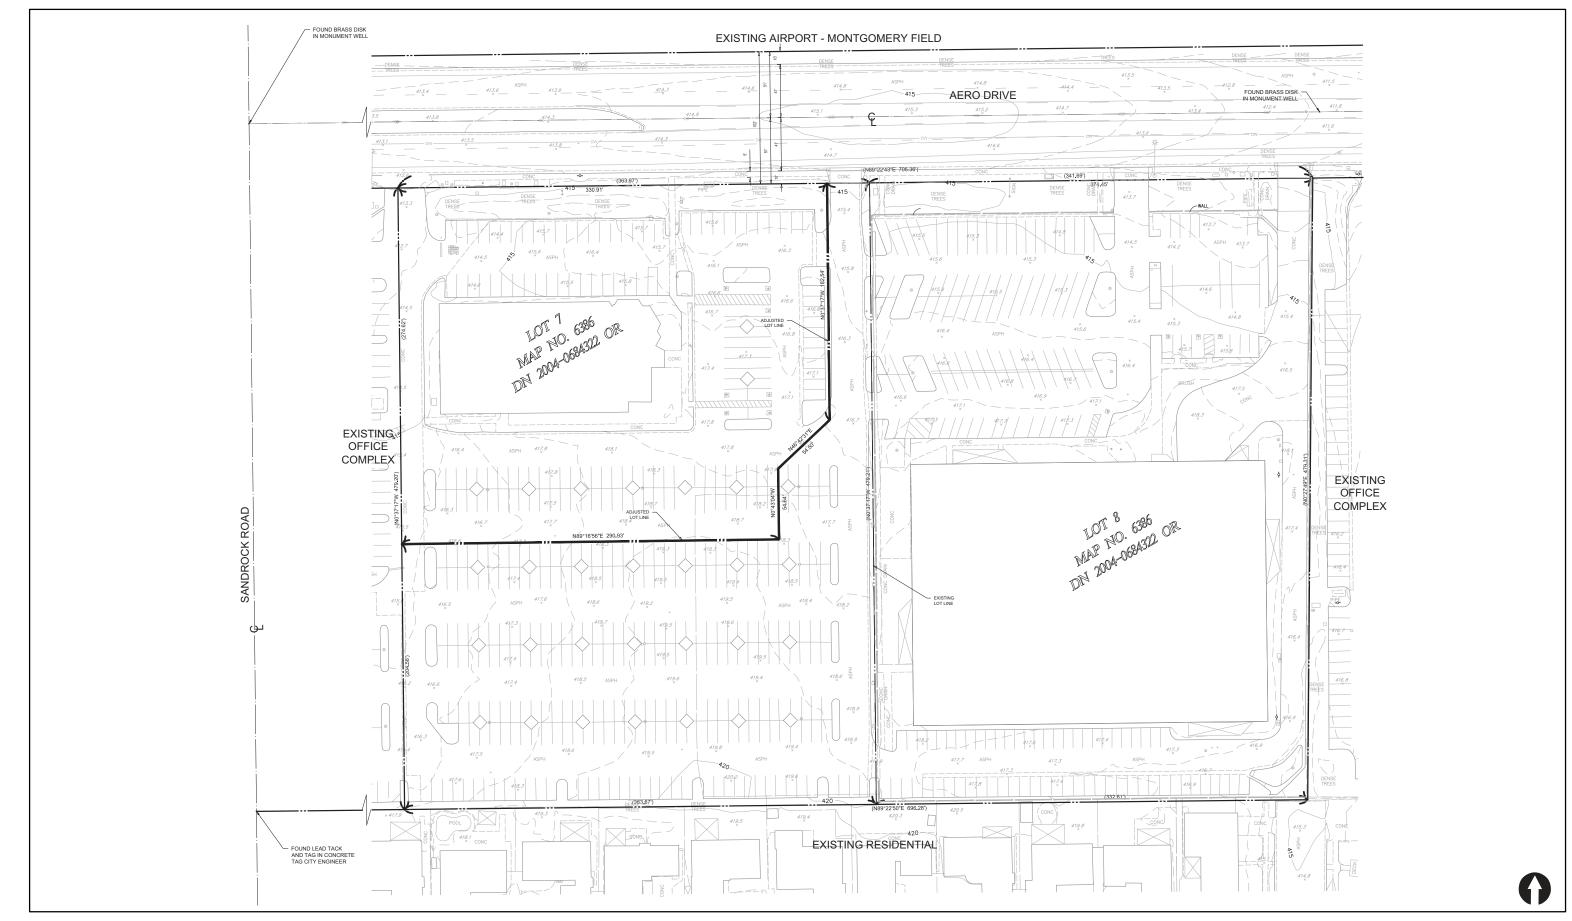

Figure 2-3 shows the existing site plan and Figure 2-4 shows the proposed conceptual site plan.

#### **Proposed Site Plan**

# 3.0 EXISTING CONDITIONS

## 3.1 Existing Street System

The following provides a brief description of the street system in the Project area. *Figure 3–1* illustrates existing conditions in terms of traffic lanes and intersection controls.

**Aero Drive** is classified in the *Kearny Mesa Community Plan* as a 6-Lane Prime from Convoy Street to Sandrock Road and as a 4-Lane Major from Sandrock Road to I-15. It is currently constructed as a 4-Lane Major with a raised median from Convoy Street to Sandrock Road, as a 4-Lane Collector with a continuous two-way turn-lane from Sandrock Road to Ruffin Road, again as a 4-Lane Major with a raised median from Ruffin Road to Murphy Canyon Road, and a 5-Lane Major with a raised median between Murphy Canyon Road and I-15. The Project will construct a raised median on Aero Drive along the project frontage, connecting to the existing median to the west of the Project site, in order to satisfy the City's Major Roadway requirements. The posted speed limit is 40 mph from Convoy Street to Sandrock Road and 45 mph from Sandrock Road to I-15. Class II bike lanes and sidewalks are provided on both sides of the roadway. Curbside parking is prohibited. Public transportation is available along Aero Drive. There are currently 16 stops on both sides of the road between Convoy Street and I-15.

**Sandrock Road** is classified in the *Kearny Mesa Community Plan* as a 2-Lane Collector. It is currently constructed as a 2-lane roadway with a raised median between Aero Drive and Haveteur Way and a center two-way left-turn lane between Haveteur Way and Hulburt Street. The posted speed limit is 35mph. Class II bike lanes and sidewalks are provided on both sides of the roadway. Curbside parking is allowed on both sides of the road. Public transportation is available on Aero Drive and Sandrock Road (Route 25) providing services to and from Fashion Valley Road and Kearny Mesa via Tierrasanta and Stonecrest. An additional bus stop is available on Sandrock Road and Murray Ridge Road (Route 928) providing services to and from Fashion Valley Road and Kearny Mesa via Serra Mesa and Stonecrest.

## 3.2 Existing Bicycle Network

Based on a review of the City of San Diego *Bicycle Master Plan*, the *Kearny Mesa Community Plan* and field observations, there are existing Class II bike lanes provided along Aero Drive, between Convoy Street and Murphy Canyon Road within the study area. Class II bike lanes with buffers are provided along Sandrock Road.

## 3.3 Existing Transit Conditions

Public transit is available throughout the study area. Based on the most recent information on the San Diego Metropolitan Transit System (MTS) website, there are a total of 16 stops on both sides of Aero Drive serviced by route 25 and route 928. The stops along Aero Drive include Kearny Villa Road, Aero Court, Afton Road, Sandrock Road, Kearny Mesa Library, Corporate Court, Ruffin Road, West Canyon Avenue, Daley Center Drive, and Murphy Canyon Road. There are two transit stops along Sandrock Road serviced by route 928 at Aero Drive and Murray Ridge Road.

LINSCOTT, LAW & GREENSPAN, engineers

- *Route 25* provides services to and from Fashion Valley and Kearny Mesa via Tierrasanta and Stonecrest. Route 25 currently operates Monday through Friday from 7:10 AM through 6:10 PM departing from Fashion Valley Transit Center and arriving at Kearny Mesa Transit Center. All schedules include one-hour headways.
- *Route 928* provides services to and from Fashion Valley and Kearny Mesa via Serra Mesa and Stonecrest. Route 928 currently operates Monday through Friday from 5:25 AM through 9:37 PM with 30-minute headways departing from Fashion Valley Transit Center and arriving at Kearny Mesa Transit Center. Saturday service begins at 7:05 AM and ends at 9:05 PM departing from Fashion Valley Transit Center and arriving at Stonecrest Plaza. Sunday service begins at 9:05 AM and ends at 6:05 departing from Fashion Valley Transit Center and arriving at Stonecrest Plaza. Saturday and Sunday schedules include one-hour headways

#### 3.4 Existing Pedestrian Conditions

Based on field observations within the study area, the following pedestrian conditions are noted:

**Aero Drive:** Contiguous five-foot sidewalks are provided along the eastbound side of Aero Drive from Convoy Street to I-15 with the exception of the bridge section just east of Convoy Street where sidewalks are not provided. Non-contiguous sidewalks are provided on the westbound side of Aero Drive from Convoy Street to I-15 except between Aero Court and Afton Road and between Sandrock Road and West Canyon Avenue where sidewalks are not provided. Striped crosswalks are provided at all signalized intersections within the study area. There are currently no high-visibility crosswalks in the area.

**Sandrock Road:** Non-contiguous five-foot sidewalks are provided on both sides of Sandrock Road. Striped crosswalks are provided at all signalized intersections along Sandrock Road.

### 3.5 Existing Traffic Volumes

Existing weekday AM (7-9 AM) and PM (4-6 PM) peak hour traffic volumes and daily traffic counts were collected at the study area intersections and street segments to capture peak commuter activity. The counts were conducted on Thursday August 30, 2018 while area schools were in session. *Figure* **3**-**2** shows the existing AM and PM peak hour turning movement counts and ADTs. *Appendix A* contains copies of the intersection manual count sheets and road tube count summaries.

# 4.0 ANALYSIS APPROACH AND METHODOLOGY

## 4.1 Study Area

The study area for this project encompasses areas of anticipated impact related to the project. The scope of the study area was developed in coordination with City of San Diego staff based on the project's trip generation and City of San Diego Traffic Impact Study Manual guidelines. The study area includes the following thirteen (13) intersections and twelve (12) street segments

#### Intersections

- 1. Aero Drive / Convoy Street (signalized)
- 2. Aero Drive / Kearny Villa Road (signalized)
- 3. Aero Drive / Aero Court (signalized)
- 4. Aero Drive / Afton Road (signalized)
- 5. Aero Drive / Sandrock Road (signalized)
- 6. Aero Drive / Project Driveway (unsignalized)
- 7. Aero Drive / Corporate Court (unsignalized)
- 8. Aero Drive / Ruffin Road (signalized)
- 9. Aero Drive / West Canyon Avenue (signalized)
- 10. Aero Drive / Daley Center Drive (signalized)
- 11. Aero Drive / Murphy Canyon Road (signalized)
- 12. Aero Drive / I-15 Southbound Ramps (signalized)
- 13. Aero Drive / I-15 Northbound Ramps (signalized)

#### Segments

#### Aero Drive

- 1. Convoy Street to Kearny Villa Road
- 2. Kearny Villa Road to Aero Court
- 3. Aero Court to Afton Road
- 4. Afton Road to Sandrock Road
- 5. Sandrock Road to Project Driveway
- 6. Project Driveway to Corporate Court
- 7. Corporate Court to Ruffin Road
- 8. Ruffin Road to West Canyon Avenue
- 9. West Canyon Avenue to Daley Center Drive
- 10. Daley Center Drive to Murphy Canyon Road
- 11. Murphy Canyon Road to I-15 Southbound Ramps
- 12. I-15 Southbound Ramps to I-15 Northbound Ramps

No analyses of freeway mainlines or ramps meters were included since less than 50 and 20 peak hour Project trips would be added to these facilities, respectively.

#### LINSCOTT, LAW & GREENSPAN, *engineers*

## 4.2 Analysis Approach

Level of service (LOS) is the term used to denote the different operating conditions which occur on a given roadway segment under various traffic volume loads. It is a qualitative measure used to describe a quantitative analysis considering factors such as roadway geometries, signal phasing, speed, travel delay, freedom to maneuver, and safety. Level of service provides an index to the operational qualities of a roadway segment or an intersection. Level of service designations range from A to F, with LOS A representing the best operating conditions and LOS F representing the worst operating conditions. Level of service designation is reported differently for signalized intersections and for roadway segments.

## 4.3 Intersections

*Signalized intersections* were analyzed under weekday 7:00-9:00 AM and 4:00-6:00 PM peak hour conditions. Average vehicle delay was determined utilizing the methodology found in Chapter 18 of the *Highway Capacity Manual (HCM) 6*, with the assistance of the *Synchro* (version 10) computer software. The delay values (represented in seconds) were qualified with a corresponding intersection Level of Service (LOS).

City of San Diego and Caltrans location-specific signal timing information such as minimum greens, cycle lengths, phasing, and splits for the freeway interchanges, where available, and real-time peak hour field observations were included in the analysis. *Appendix A* contains copies of the signal timing sheets.

Unsignalized intersections were analyzed under weekday 7:00-9:00 AM and 4:00-6:00 PM peak hour conditions. Average vehicle delay and Levels of Service (LOS) was determined based upon the procedures found in Chapter 20 and 21 of the *Highway Capacity Manual (HCM)* 6, with the assistance of the *Synchro* (version 10) computer software. Real-time peak hour field observations were included in the analysis

## 4.4 Street Segments

Street segment analysis is based upon the comparison of daily traffic volumes (ADTs) to the City of San Diego's *Roadway Classification, Level of Service, and ADT Table*. This table provides segment capacities for different street classifications, based on traffic volumes and roadway characteristics.

# 5.0 SIGNIFICANCE CRITERIA

For the purposes of this traffic study, City of San Diego's *Significance Determination Thresholds* were used as a guide. According to the City of San Diego's *Significance Determination Thresholds* report dated July 2016, a project is considered to have a significant impact if the new project traffic has decreased the operations of surrounding roadways by a City-defined threshold. The City-defined threshold by roadway type or intersection is shown in *Table 5–1*.

The impact is designated either a "direct" or "cumulative" impact. According to the City's *Significance Determination Thresholds* report,

"*Direct* traffic impacts are those projected to occur at the time a proposed development becomes operational, including other developments not presently operational but which are anticipated to be operational at that time (near term)."

"*Cumulative* traffic impacts are those projected to occur at some point after a proposed development becomes operational, such as during subsequent phases of a project and when additional proposed developments in the area become operational (short-term cumulative) or when affected community plan area reaches full planned buildout (long-term cumulative)."

For intersections and roadway segments affected by a project, level of service (LOS) D or better is considered acceptable under both direct and cumulative conditions."

If the project exceeds the thresholds in *Table 5–1*, then the project may be considered to have a significant "direct" or "cumulative" project impact. A significant impact can also occur if a project causes the Level of Service to degrade from D to E, even if the allowable increases in *Table 5–1* are not exceeded. A feasible mitigation measure will need to be identified to return the impact within the City thresholds, or the impact will be considered significant and unmitigated.

| TABLE 5–1                             |
|---------------------------------------|
| CITY OF SAN DIEGO                     |
| TRAFFIC IMPACT SIGNIFICANT THRESHOLDS |

| Level of             | Allowable Increase Due to Project Impacts <sup>a</sup> |               |  |  |  |  |  |  |
|----------------------|--|---------------|--|--|--|--|--|--|
| Service with         | Roadway Segments                                       | Intersections |  |  |  |  |  |  |
| Project <sup>b</sup> | V/C  | Delay (sec.)  |  |  |  |  |  |  |
| Е                    | 0.02   | 2.0           |  |  |  |  |  |  |
| F                    | 0.01   | 1.0           |  |  |  |  |  |  |

#### Footnotes:

- a. If a proposed project's traffic causes the values shown in the table to be exceeded, the impacts are determined to be significant. The project applicant shall then identify feasible improvements (within the Traffic Impact Study) that will restore/and maintain the traffic facility at an acceptable LOS. If the LOS with the proposed project becomes unacceptable (see note b), the project applicant shall be responsible for mitigating the project's direct significant and/or cumulatively considerable traffic impacts.
- b. All LOS measurements are based upon Highway Capacity Manual procedures for peak-hour conditions. However, V/C ratios for roadway segments are estimated on an ADT/24-hour traffic volume basis (using Table 2 of the City's Traffic Impact Study Manual). The acceptable LOS for roadways and intersections is generally "D" ("C" for undeveloped locations).

#### General Notes:

- 1. Delay = Average control delay per vehicle measured in seconds for intersections or minutes for ramp meters
- 2. LOS = Level of Service
- 3. V/C = Volume to Capacity ratio

# 6.0 ANALYSIS OF EXISTING CONDITIONS

The analysis of existing conditions includes the assessment of the study area intersections and street segments using the methodologies described in *Section 4.0*.

#### 6.1 Intersection Analysis

Intersection capacity analyses were conducted for the study intersections under existing conditions. *Table 6–1* reports the intersection operations during the peak hour conditions. As shown in *Table 6–1*, the following study area intersections are currently calculated to operate at LOS E or F:

- 1. Aero Drive / Convoy Street (LOS E during the AM peak hour)
- 2. Aero Drive / Kearny Villa Road (LOS E during the AM peak / LOS F during PM peak)
- 5. Aero Drive / Sandrock Road (LOS E during the PM peak hour)
- 7. Aero Drive / Corporate Court (LOS E during the PM peak hour)
- 8. Aero Drive / Ruffin Road (LOS E during the AM peak hour)
- 10. Aero Drive / Daley Center Drive (LOS E during AM peak hour)
- 12.Aero Drive / I-15 Southbound Ramps (LOS F during the AM peak hour)
- 13. Aero Drive / I-15 Northbound Ramps (LOS F during the AM peak hour)

Appendix B contains the intersection analysis sheets for the Existing scenario.

#### 6.2 Street Segment Analysis

Existing daily street segment analysis was conducted for the study street segments. *Table 6–2* reports the street segment operations. As shown in *Table 6–2*, the study street segments are currently calculated to operate at LOS D or better with the exception of Aero Drive between Murphy Canyon Road and I-15 Southbound Ramps which is calculated to operate at LOS F.

# 7.0 TRIP GENERATION/DISTRIBUTION/ASSIGNMENT

## 7.1 Trip Generation

The Project proposes the repurposing of an existing office building. The project site currently includes a 113,981 SF office building. The existing office building is not occupied, but was occupied for over 30-years until the fourth quarter of 2016. Based on the historical tenancy of the existing building on the site, a modified baseline was used for assessing the potential transportation impacts. Therefore, a trip generation credit was assumed for the office that is not currently occupied.

The Project proposes to repurpose and expand the existing building to provide a 138,915 SF Veterans Affairs Hospital Annex. The Project trip generation was calculated for the AM/PM peak hours and for the daily (ADT) periods using published City of San Diego *driveway* and *cumulative* trip rates.

For the purpose of this study, the *Commercial Office* trip rates were used to calculate the project site's trip credit and the *Medical Office* trip rates were used to calculate the proposed project's trips since outpatient services will be provided. The City of San Diego's *driveway* rate for the Medical Office land use is 50 weekday trips per 1,000 SF, while the cumulative rate is 16 trips weekday per 1,000 SF for an office over 100,000 SF. There is no difference between the driveway and cumulative trip rates for the Commercial Office land use. Per the City of San Diego's Trip Generation Manual, May 2003, the following definitions of driveway trips, cumulative trips and pass-by trips are provided:

- *Driveway Trips*: The total number of trips that are generated by a site. The sum of cumulative trips plus the pass-by trips.
- *Cumulative Trips:* New vehicle trips added to a community. Cumulative trips are driveway trips minus pass-by trips.
- *Pass-by Trips*: A trip that is deviated from the roadway to a site for a stop-over to sites such as retail establishments, banks, restaurants, service stations, etc. A trip made to a site from traffic already "passing by" that site on an adjacent street that contains direct access to the generator. These are existing vehicle trips in a community.

For the purposes of this study, the driveway trip rates were used to analyze the intersections of Aero Drive / Sandrock Road and Aero Drive / Project Driveway as well as the segment of Aero Drive between Sandrock Road and the Project Driveway. The cumulative trip rates were used to analyze the remainder of the study intersections and street segments.

*Table 7–1* shows the total driveway trip generation summary for the proposed Project. As shown in *Table 7-1*, the Project is calculated to generate 5,082 driveway ADT with 175 additional AM peak hour trips (115 inbound/ 60 outbound) and 434 additional PM peak hour trips (156 inbound trips/ 278 outbound).

LINSCOTT, LAW & GREENSPAN, engineers

**Table 7–2** shows the total cumulative trip generation summary for the proposed Project. As shown in *Table 7-2*, the Project is calculated to generate 359 cumulative ADT with 109 fewer AM peak hour trips (111 fewer inbound trips / 2 additional outbound) and 39 fewer PM peak hour trips (15 additional inbound trips/ 54 fewer outbound trips).

## 7.2 Trip Distribution/Assignment

Project traffic was distributed to the street system based on the Project's planned service area, expected client / employee residential locations, existing traffic patterns, the proximity of the Project site to I-805 and I-15, and knowledge of the local area.

Using the City's cumulative trip rate, the Project is calculated to add  $\underline{2}$  additional outbound trips during the AM peak hour. For trip assignment purposes, this number was conservatively increased to 20 additional trips. Similarly, using the City's cumulative trip rate, the Project is calculated to add  $\underline{15}$  additional inbound trips during the PM peak hour. For trip assignment purposes, this number was conservatively increased to 50 additional trips

Figure 7–1 shows the Project's traffic distribution. Figure 7–2 shows the Project traffic assignment.

 TABLE 7–2

 TRIP GENERATION – CUMULATIVE RATES

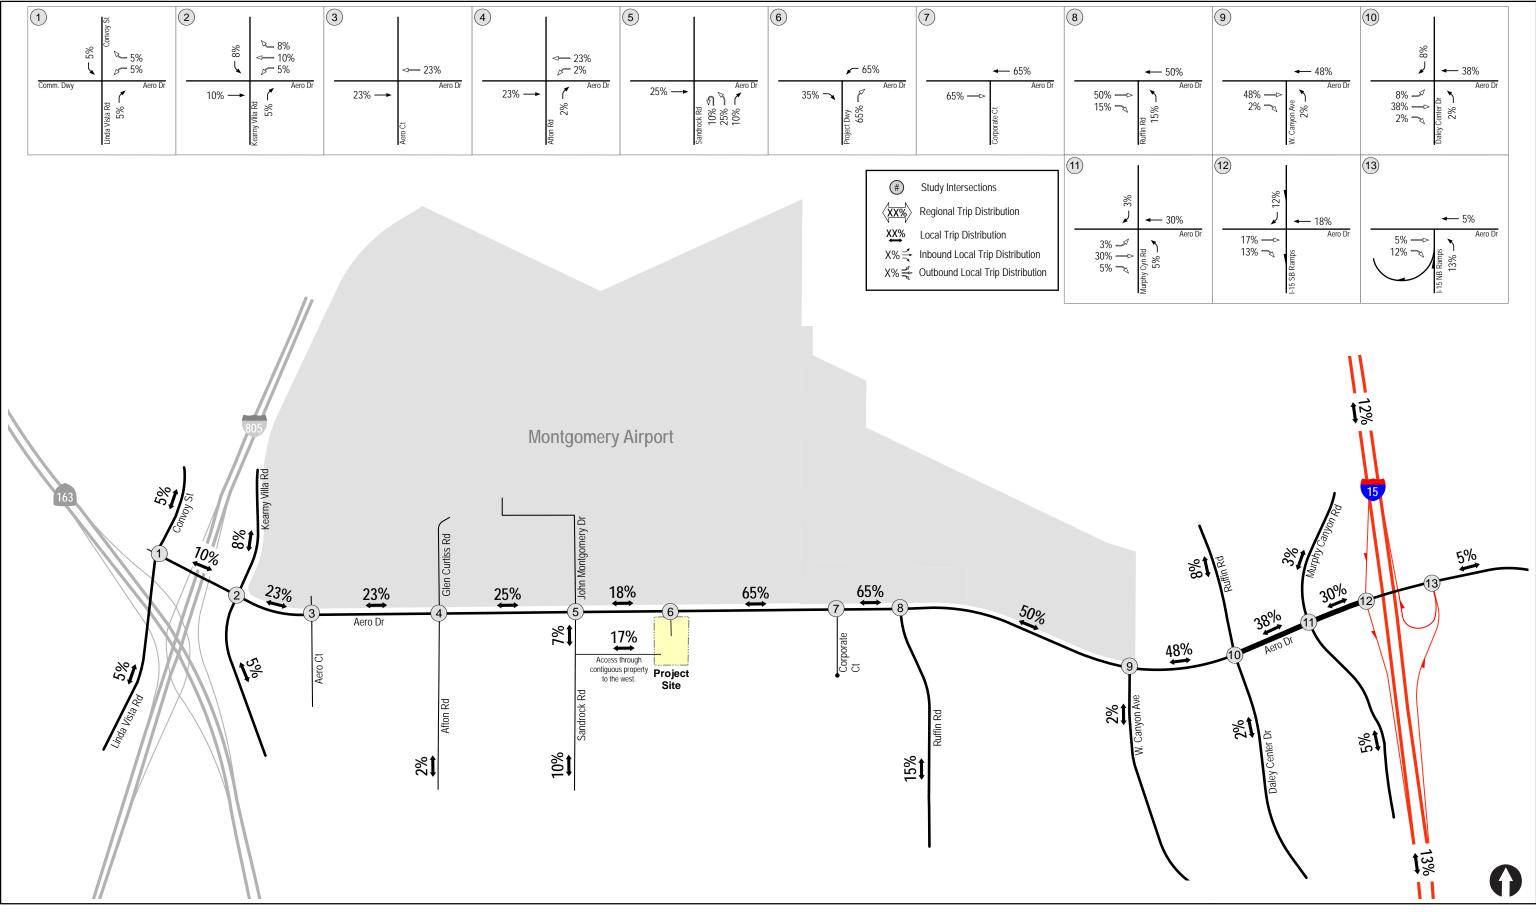

Footnotes:

a. LN FORMULA: Ln(T) = 0.756 Ln(x) + 3.95. ~16.35 ADT / KSF

b. Medical Office and Commercial Office rates as shown in San Diego Municipal Code Trip Generation Manual, 2003

c. The Project is calculated to add <u>2</u> additional outbound trips during the AM peak hour. For trip assignment purposes, this number was conservatively increased to <u>20</u> additional trips.

d. The Project is calculated to add <u>15</u> additional inbound trips during the PM peak hour. For trip assignment purposes, this number was conservatively increased to <u>50</u> additional trips.

Figure 7-1

# **Project Traffic Distribution**

Figure 7-2

# **Project Traffic Volumes**

# 8.0 EXISTING + PROJECT ANALYSIS

Project traffic was added onto existing traffic volumes to determine Existing + Project volumes.

*Figure 8–1* shows the Existing + Project peak hour turning movement volumes and daily traffic volumes. A detailed description of the Project distribution and assignment is included in *Section 7.0*.

#### 8.1.1 Intersection Analysis

*Table 8–1* summarizes the peak hour intersection operations under Existing + Project conditions. As shown in *Table 8–1*, the following study area intersections are calculated to operate at LOS E or F:

- 1. Aero Drive / Convoy Street (LOS E during the AM peak hour)
- 2. Aero Drive / Kearny Villa Road (LOS E during the AM peak / LOS F during PM peak)
- 5. Aero Drive / Sandrock Road (LOS E during the PM peak hour)
- 7. Aero Drive / Corporate Court (LOS E during the PM peak hour)
- 8. Aero Drive / Ruffin Road (LOS E during the AM peak hour)
- 10. Aero Drive / Daley Center Drive (LOS E during AM peak hour)
- 12. Aero Drive / I-15 Southbound Ramps (LOS F during the AM peak hour)
- 13. Aero Drive / I-15 Northbound Ramps (LOS F during the AM peak hour)

Based on the City of San Diego's significance criteria, a significant direct impact is calculated at the intersection of Aero Drive / Sandrock Road.

Appendix D contains the intersection analysis sheets for the Existing + Project scenario.

### 8.1.2 Street Segment Analysis

**Table 8–2** summarizes the Existing + Project street segment operations. As shown in *Table 8–2*, the study street segments are currently calculated to operate at LOS D or better with the exception of Aero Drive between Murphy Canyon Road and I-15 Southbound Ramps which is calculated to operate at LOS F. It should be noted that the segment of Aero Drive between Sandrock Road and the Project Driveway was analyzed as a 4-lane Major under Existing + Project conditions since the Project will construct a raised median along its frontage, connecting to the existing median to the west of the Project site, in order to satisfy the City's Major Roadway requirements as part of the project.

Based on the City of San Diego's significance criteria, <u>no</u> significant impacts are calculated along the study area street segments as the Project contribution does not exceed the allowable thresholds.

 TABLE 8–2

 EXISTING + PROJECT STREET SEGMENT OPERATIONS

Footnotes:

a. Capacities based on City of San Diego Roadway Classification Table (See Appendix C).

b. Average Daily Traffic.

c. Level of Service.

d. Volume to Capacity ratio.

e. " $\Delta$ " denotes the Project-induced increase in Volume to Capacity ratio.

f. The Project will construct a raised median on Aero Drive along the Project frontage, connecting to the existing median to the west of the Project site, in order to satisfy the City's Major Roadway requirement. Therefore, this segment was analyzed as a 4-Lane Major under Existing + Project conditions.

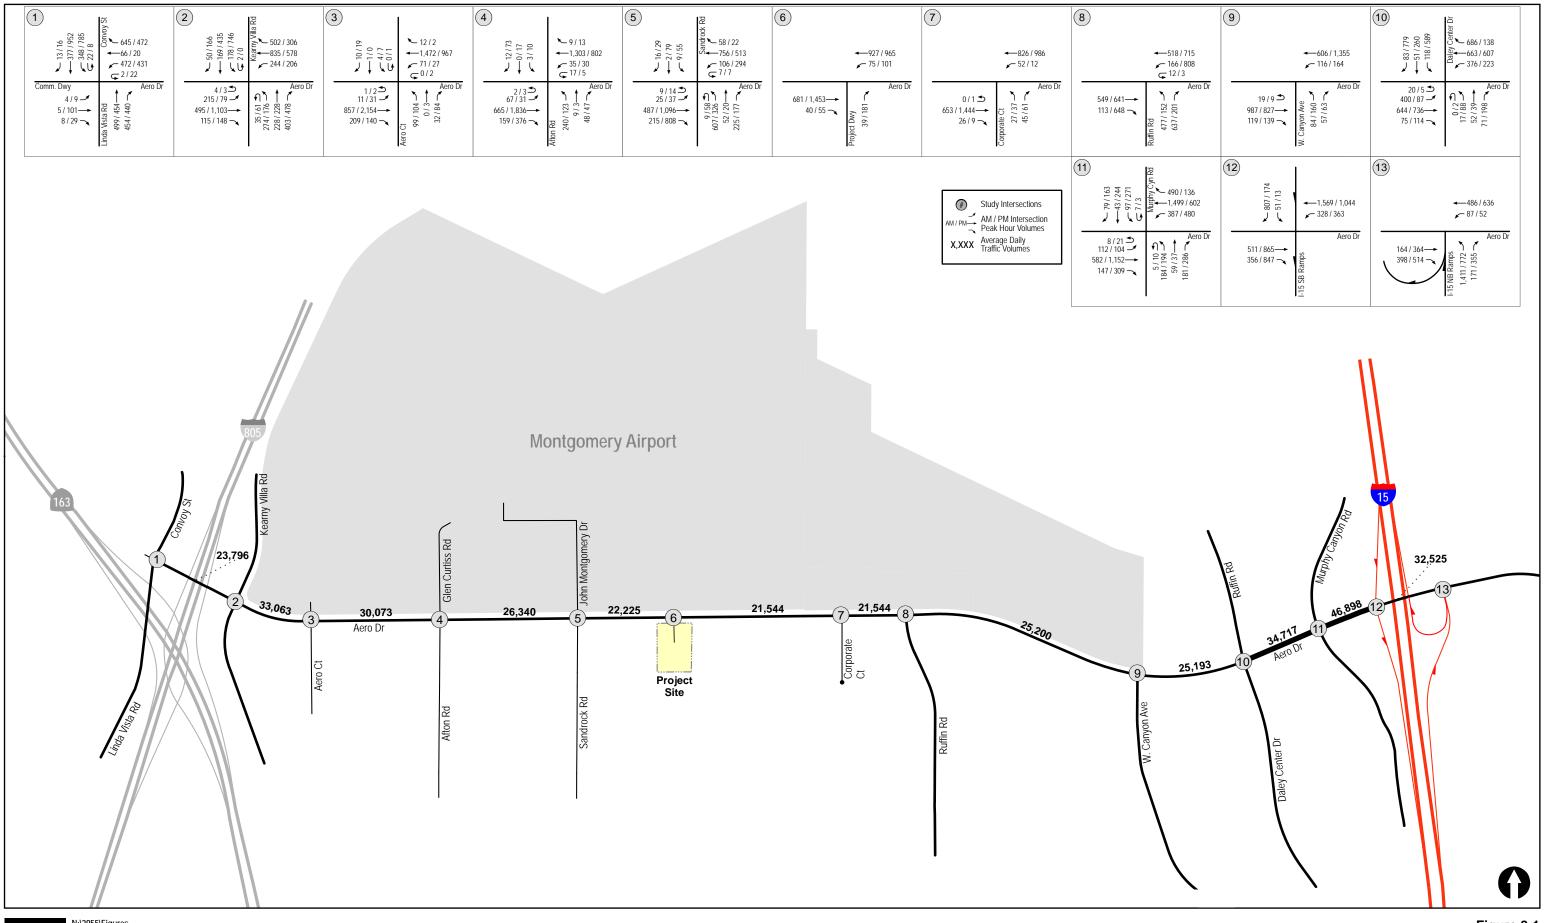

Figure 8-1

## **Existing + Project Traffic Volumes**

# 9.0 CUMULATIVE PROJECTS

Cumulative projects represent reasonably foreseeable planned development that contributes to background traffic conditions for the Near-Term (2020) scenario.

#### 9.1 Cumulative Project Research

LLG researched ongoing cumulative project development in the study area and identified 14 cumulative projects for consideration in the Near-Term (2020). It is important to note that some of these projects may not be constructed prior to the Project's opening day in 2020. In any case, they were included as a part of the background traffic growth to be conservative.

**Table 9–1** contains a list of cumulative projects that were considered in the Near-Term (2020) analysis. *Figure 9–1* shows the cumulative projects traffic volumes and *Figure 9-2* shows the locations of the cumulative projects.

|     | Project Name                                   | Location   | Туре                                    | Size         | ADT   | Status                              |

 TABLE 9-1

 CUMULATIVE PROJECTS (OPENING DAY 2020)

Footnotes:

a. Phase 2 of the Le Petite Ecole project is estimated to be complete in 2022. However, in order to provide a conservative analysis, Phase 2 was considered under Near-Term conditions.

b. Phase 1 of the Kaiser project includes a 321-bed hospital and a 75,000 SF medical office building. The hospital portion of Phase I has been completed and was open at the time this study was prepared. The medical office building portion of Phase 1 was assumed to be forthcoming and is therefore included in the cumulative analysis. Phase 2 of the project contains a 129-bed hospital and a 105,000 SF medical office building and will not be constructed prior to the opening day of the Project.

# 10.0 NEAR-TERM (YEAR 2020) ANALYSIS

The following section presents the analysis of study area intersections and street segments under Near-Term (Year 2020) conditions without and with the proposed Project.

### 10.1 Near-Term (Year 2020) Traffic Volumes

Near-Term (Year 2020) traffic volumes were calculated for the study area by adding the cumulative project volumes onto the existing traffic volumes. Near-Term (Year 2020) + Project traffic volumes were calculated by then adding the Project traffic volumes.

*Figure 10–1* shows the Near-Term (Year 2020) traffic volumes. *Figure 10–2* shows the Near-Term (Year 2020) + Project traffic volumes.

#### 10.2 Near-Term (Year 2020) without Project Operations

10.2.1 Intersection Analysis

*Table 10–1* summarizes the peak hour intersection operations for the Near-Term (Year 2020) scenario. As seen in *Table 10–1*, the following study area intersections are calculated to operate at LOS E or F:

- 1. Aero Drive / Convoy Street (LOS E during the AM peak hour)
- 2. Aero Drive / Kearny Villa Road (LOS F during the AM and PM peak hours)
- 3. Aero Drive / Aero Court (LOS E during the PM peak hour)
- 5. Aero Drive / Sandrock Road (LOS E during the PM peak hour)
- 7. Aero Drive / Corporate Court (LOS F during the PM peak hour)
- 8. Aero Drive / Ruffin Road (LOS E during the AM peak hour)
- 10. Aero Drive / Daley Center Drive (LOS E during the AM and PM peak hours)
- 12. Aero Drive / I-15 Southbound Ramps (LOS F during the AM peak hour)
- 13. Aero Drive / I-15 Northbound Ramps (LOS F during the AM peak hour)

Appendix E contains the intersection analysis sheets for the Near-Term (Year 2020) scenario.

#### 10.2.2 Street Segment Analysis

*Table 10–2* summarizes the Near-Term (Year 2020) street segment operations. As shown in *Table 10–2*, the following study street segments are calculated to operate at LOS E or F:

- 10. Aero Drive: Daley Center Drive to Murphy Canyon Road (LOS E)
- 11. Aero Drive: Murphy Drive to I-15 Southbound Ramps (LOS F)

#### 10.3 Near-Term (2020) + Project Operations

#### 10.3.1 Intersection Analysis

*Table 10–1* summarizes the peak hour intersection operations for the Near-Term (Year 2020) + Project scenario. As seen in *Table 10–1*, the following study area intersections are calculated to operate at LOS E or F:

- 1. Aero Drive / Convoy Street (LOS E during the AM peak hour)
- 2. Aero Drive / Kearny Villa Road (LOS F during the AM and PM peak hours)
- 3. Aero Drive / Aero Court (LOS E during the PM peak hour)
- 5. Aero Drive / Sandrock Road (LOS E during the PM peak hour)
- 7. Aero Drive / Corporate Court (LOS F during the PM peak hour)
- 8. Aero Drive / Ruffin Road (LOS E during the AM peak hour)
- 10. Aero Drive / Daley Center Drive (LOS E during AM and PM peak hours)
- 12. Aero Drive / I-15 Southbound Ramps (LOS F during the AM peak hour)
- 13. Aero Drive / I-15 Northbound Ramps (LOS F during the AM peak hour)

Based on the City of San Diego's significance criteria, <u>no</u> significant impacts are calculated at the study area intersections as the Project contribution does not exceed the allowable thresholds. However, it should be noted that the intersection of Aero Drive / Sandrock Road is significantly impacted by the Project under Existing + Project conditions.

Appendix F contains the intersection analysis sheets for the Near-Term (Year 2020) + Project scenario.

#### 10.3.2 Street Segment Analysis

*Table 10–2* summarizes the Near-Term (Year 2020) + Project street segment operations. As shown in *Table 10–2*, the following study street segments are calculated to operate at LOS E or F:

- 10. Aero Drive: Daley Center Drive to Murphy Canyon Road (LOS E)
- 11. Aero Drive: Murphy Drive to I-15 Southbound Ramps (LOS F)

It should be noted that the segment of Aero Drive between Sandrock Road and the Project Driveway was analyzed as a 4-lane Major under Near-Term (Year 2020) + Project conditions since the Project will construct a raised median along its frontage, connecting to the existing median to the west of the Project site, in order to satisfy the City's Major Roadway requirements as part of the project.

Based on the City of San Diego's significance criteria, <u>no</u> significant impacts are calculated at the study area street segments as the Project contribution does not exceed the allowable thresholds.

 TABLE 10–2

 NEAR-TERM (YEAR 2020) + PROJECT STREET SEGMENT OPERATIONS

Footnotes:

a. Capacities based on City of San Diego Roadway Classification Table (See Appendix C).

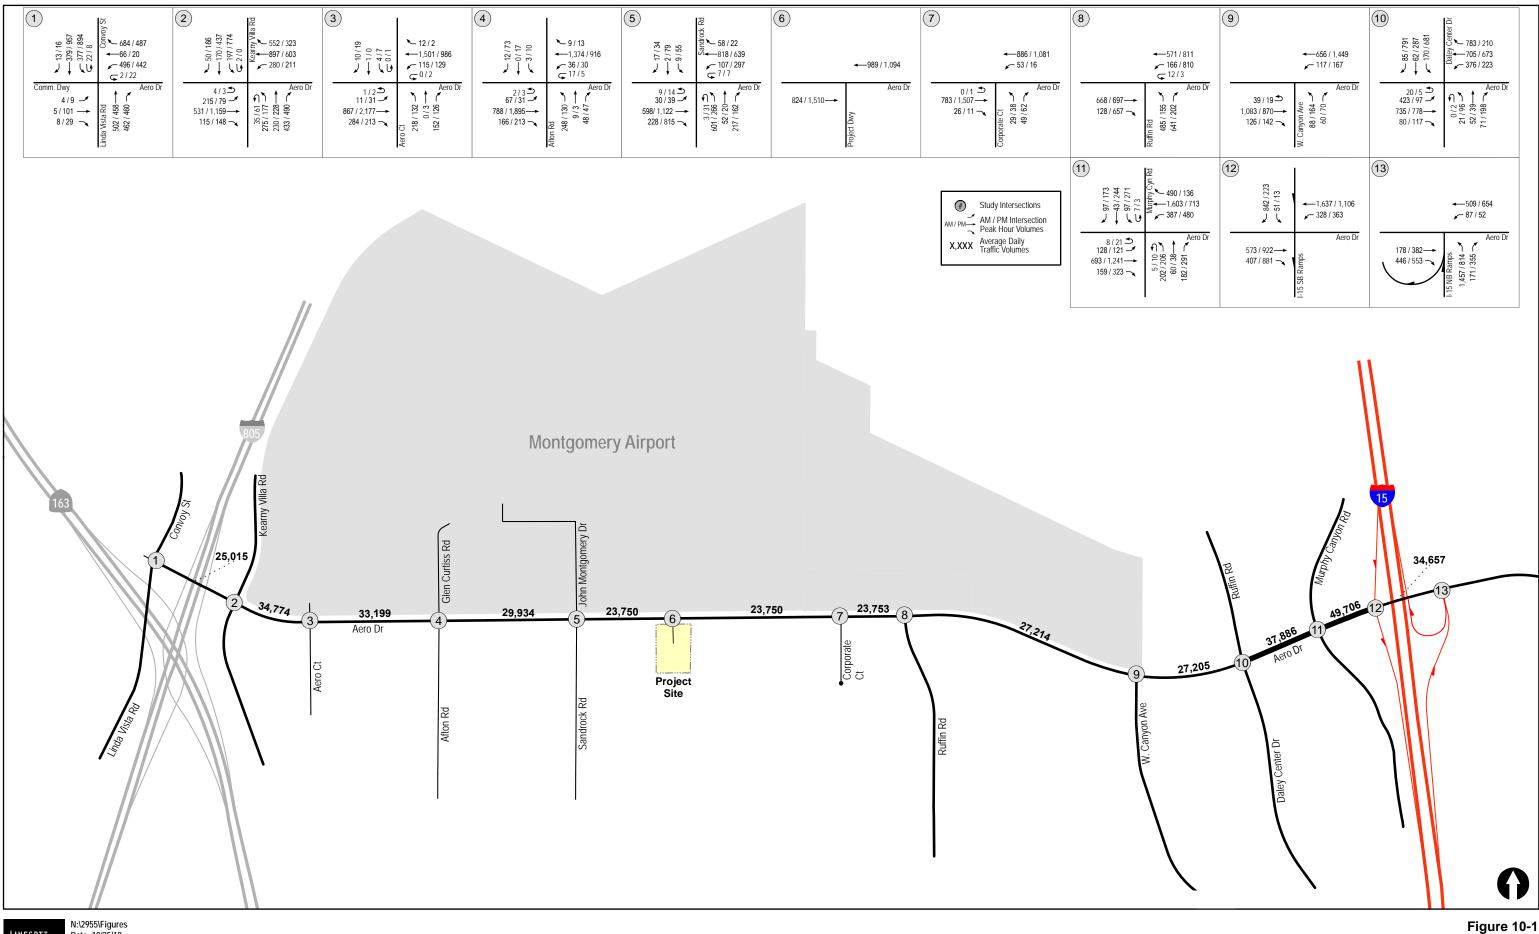

b. Average Daily Traffic.

c. Level of Service.

d. Volume to Capacity ratio.

e. " $\Delta$ " denotes the Project-induced increase in Volume to Capacity ratio.

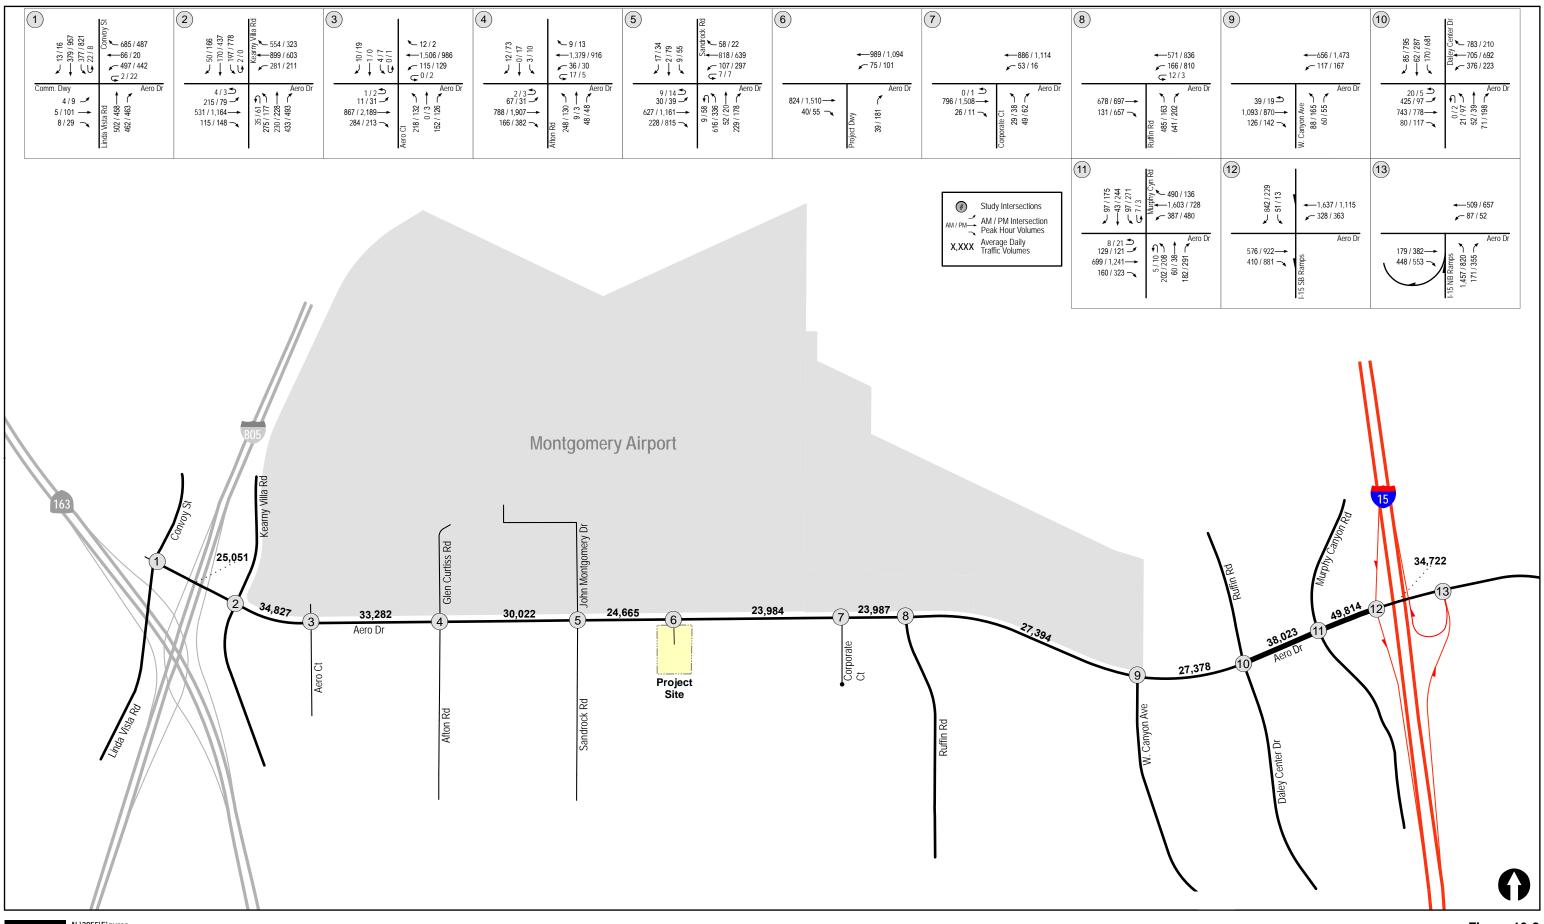

f. The Project will construct a raised median on Aero Drive along the Project frontage, connecting to the existing median to the west of the Project site, in order to satisfy the City's Major Roadway requirement. Therefore, this segment was analyzed as a 4-Lane Major under Near-Term + Project conditions.

Figure 10-2

#### Near-Term (Year 2020) + Project Traffic Volumes

# 11.0 LONG-TERM (YEAR 2035) ANALYSIS

The following section presents the analysis of study area intersections and street segments under Long-Term (Year 2035) conditions without and with the proposed Project.

# 11.1 Long-Term (Year 2035) Conditions and Traffic Volumes

#### Planned Improvements

No network improvements were assumed under Long-Term (Year 2035) conditions).

#### Long-Term (Year 2035) Traffic Volumes

Long-Term (Year 2035) traffic volumes were forecasted for the study area using the SANDAG Series 12 Regional Traffic Model (included in *Appendix L*). Based on the projected forecast ADT volumes, the Long-Term (Year 2035) peak hour volumes were calculated based on the existing relationship between ADT and peak hour volumes. The forecast volumes were also checked for consistency between intersections, where no driveways or roadways exist between intersections, and were compared to existing volumes for accuracy.

*Figure 11–1* shows the Long-Term (Year 2035) traffic volumes. *Figure 11–2* shows the Long-Term (Year 2035) + Project traffic volumes.

## 11.2 Long-Term (2035) without Project Operations

### 11.2.1 Intersection Analysis

*Table 11–1* summarizes the peak hour intersection operations for the Long-Term (Year 2035) scenario. As seen in *Table 11–1*, the following study area intersections are calculated to operate at LOS E or F:

- 1. Aero Drive / Convoy Street (LOS E during the AM peak / LOS F during PM peak)
- 2. Aero Drive / Kearny Villa Road (LOS F during the AM and PM peak hours)
- 3. Aero Drive / Aero Court (LOS E during the PM peak hour)
- 5. Aero Drive / Sandrock Road (LOS E during the PM peak hour)
- 7. Aero Drive / Corporate Court (LOS F during the PM peak hour)
- 8. Aero Drive / Ruffin Road (LOS E during the AM peak hour)
- 10. Aero Drive / Daley Center Drive (LOS F during the AM peak / LOS E during PM peak)
- 11. Aero Drive / Murphy Canyon Road (LOS E during the PM peak hour)
- 12. Aero Drive / I-15 Southbound Ramps (LOS F during the AM peak hour)
- 13. Aero Drive / I-15 Northbound Ramps (LOS F during the AM peak hour)

Appendix G contains the intersection analysis sheets for the Long-Term (Year 2035) scenario.

#### 11.2.2 Street Segment Analysis

*Table 11–2* summarizes the Long-Term (Year 2035) street segment operations. As shown in *Table 11–2*, the following study street segments are calculated to operate at LOS E or F:

- 2. Aero Drive: Kearny Villa Road to Aero Court (LOS E)
- 5. Aero Drive: Sandrock Road to the Project Driveway (LOS E)
- 6. Aero Drive: Project Driveway to Corporate Court (LOS E)
- 7. Aero Drive: Corporate Court to Ruffin Road (LOS E)
- 10. Aero Drive: Daley Center Drive to Murphy Canyon Road (LOS F)
- 11. Aero Drive: Murphy Drive to I-15 Southbound Ramps (LOS F)
- 11.3 Long-Term (Year 2035) + Project Operations

# 11.3.1 Intersection Analysis

*Table 11–1* summarizes the peak hour intersection operations for the Long-Term (Year 2035) + Project scenario. As seen in *Table 11–1*, the following study area intersections are calculated to operate at LOS E or F:

- 1. Aero Drive / Convoy Street (LOS E during the AM peak / LOS F during PM peak)
- 2. Aero Drive / Kearny Villa Road (LOS F during the AM and PM peak hours)
- 3. Aero Drive / Aero Court (LOS E during the PM peak hour)
- 5. Aero Drive / Sandrock Road (LOS E during the PM peak hour)
- 7. Aero Drive / Corporate Court (LOS F during the PM peak hour)
- 8. Aero Drive / Ruffin Road (LOS E during the AM peak hour)
- 10. Aero Drive / Daley Center Drive (LOS F during the AM peak / LOS E during PM peak)
- 11. Aero Drive / Murphy Canyon Road (LOS E during the PM peak hour)
- 12. Aero Drive / I-15 Southbound Ramps (LOS F during the AM peak hour)
- 13. Aero Drive / I-15 Northbound Ramps (LOS F during the AM peak hour)

Based on the City of San Diego's significance criteria, a significant cumulative impact is calculated at the intersection of Aero Drive / Sandrock Road.

Appendix H contains the intersection analysis sheets for the Long-Term (Year 2035) + Project scenario.

#### 11.3.2 Street Segment Analysis

*Table 11–2* summarizes the Long-Term (2035) + Project street segment operations. As shown in *Table 11–2*, the following study street segments are calculated to operate at LOS E or F:

- 2. Aero Drive: Kearny Villa Road to Aero Court (LOS E)
- 6. Aero Drive: Project Driveway to Corporate Court (LOS E)
- 7. Aero Drive: Corporate Court to Ruffin Road (LOS E)
- 10. Aero Drive: Daley Center Drive to Murphy Canyon Road (LOS F)
- 11. Aero Drive: Murphy Drive to I-15 Southbound Ramps (LOS F)

It should be noted that the segment of Aero Drive between Sandrock Road and the Project Driveway was analyzed as a 4-lane Major under Long Term (Year 2035) + Project conditions since the Project

will construct a raised median along its frontage, connecting to the existing median to the west of the Project site, in order to satisfy the City's Major Roadway requirements as part of the project.

Based on the City of San Diego's significance criteria, <u>no</u> significant impacts are calculated at the study area street segments as the Project contribution does not exceed the allowable thresholds.

 TABLE 11–2

 LONG-TERM (YEAR 2035) + PROJECT STREET SEGMENT OPERATIONS

Footnotes:

a. Capacities based on City of San Diego Roadway Classification Table (See Appendix C).

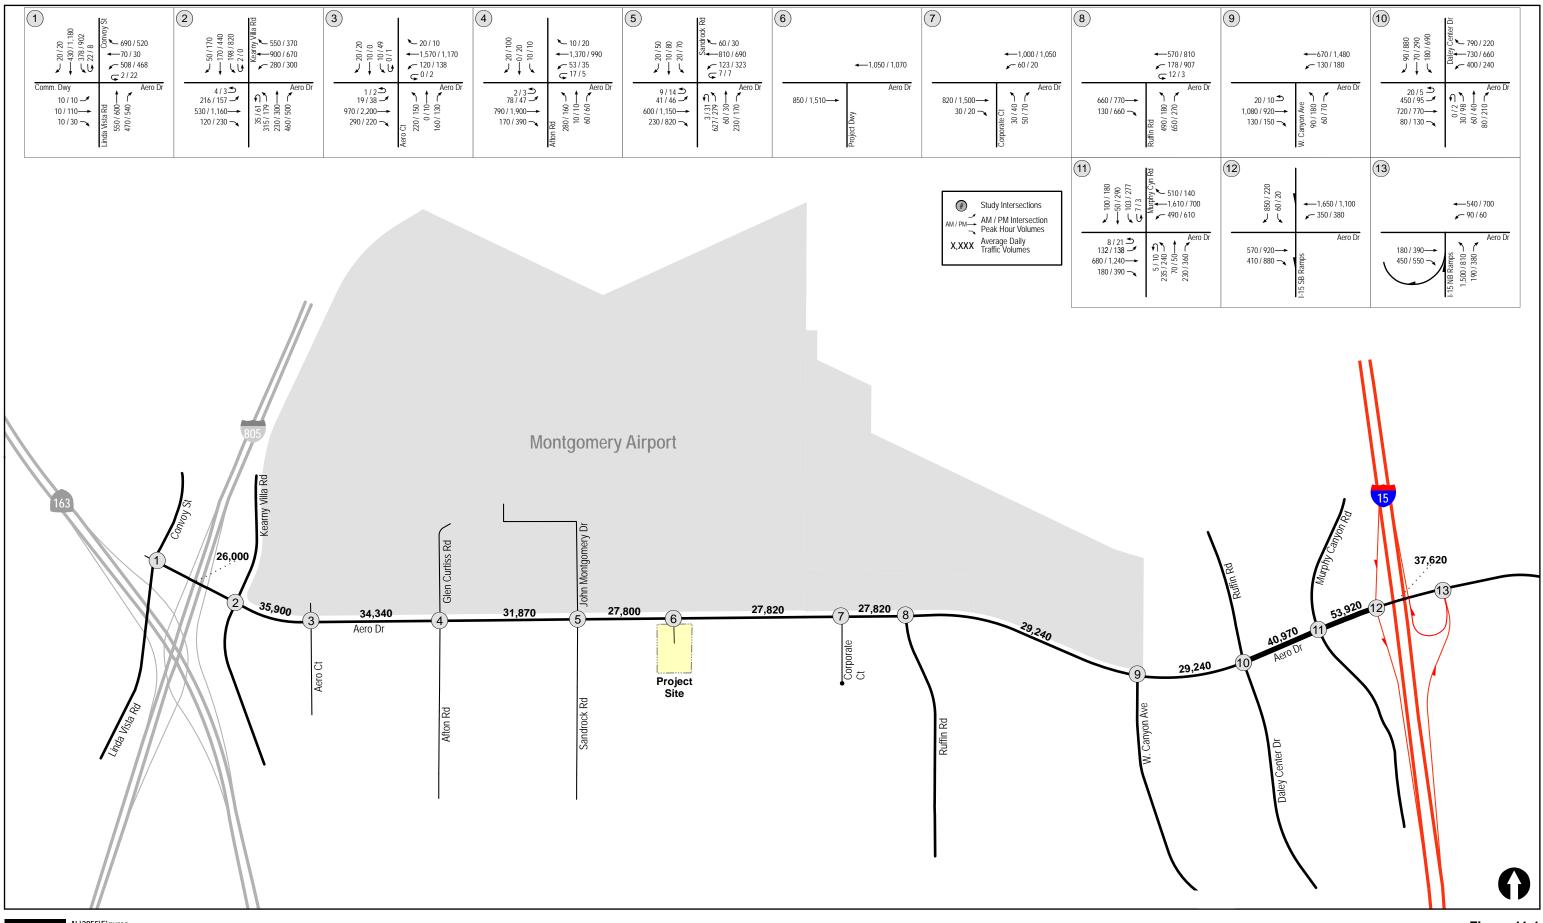

b. Average Daily Traffic.

c. Level of Service.

d. Volume to Capacity ratio.

e. " $\Delta$ " denotes the Project-induced increase in Volume to Capacity ratio.

f. The Project will construct a raised median on Aero Drive along the Project frontage, connecting to the existing median to the west of the Project site, in order to satisfy the City's Major Roadway requirement. Therefore, this segment was analyzed as a 4-Lane Major under Long-Term + Project conditions.

AERO DRIVE VA FACILITY

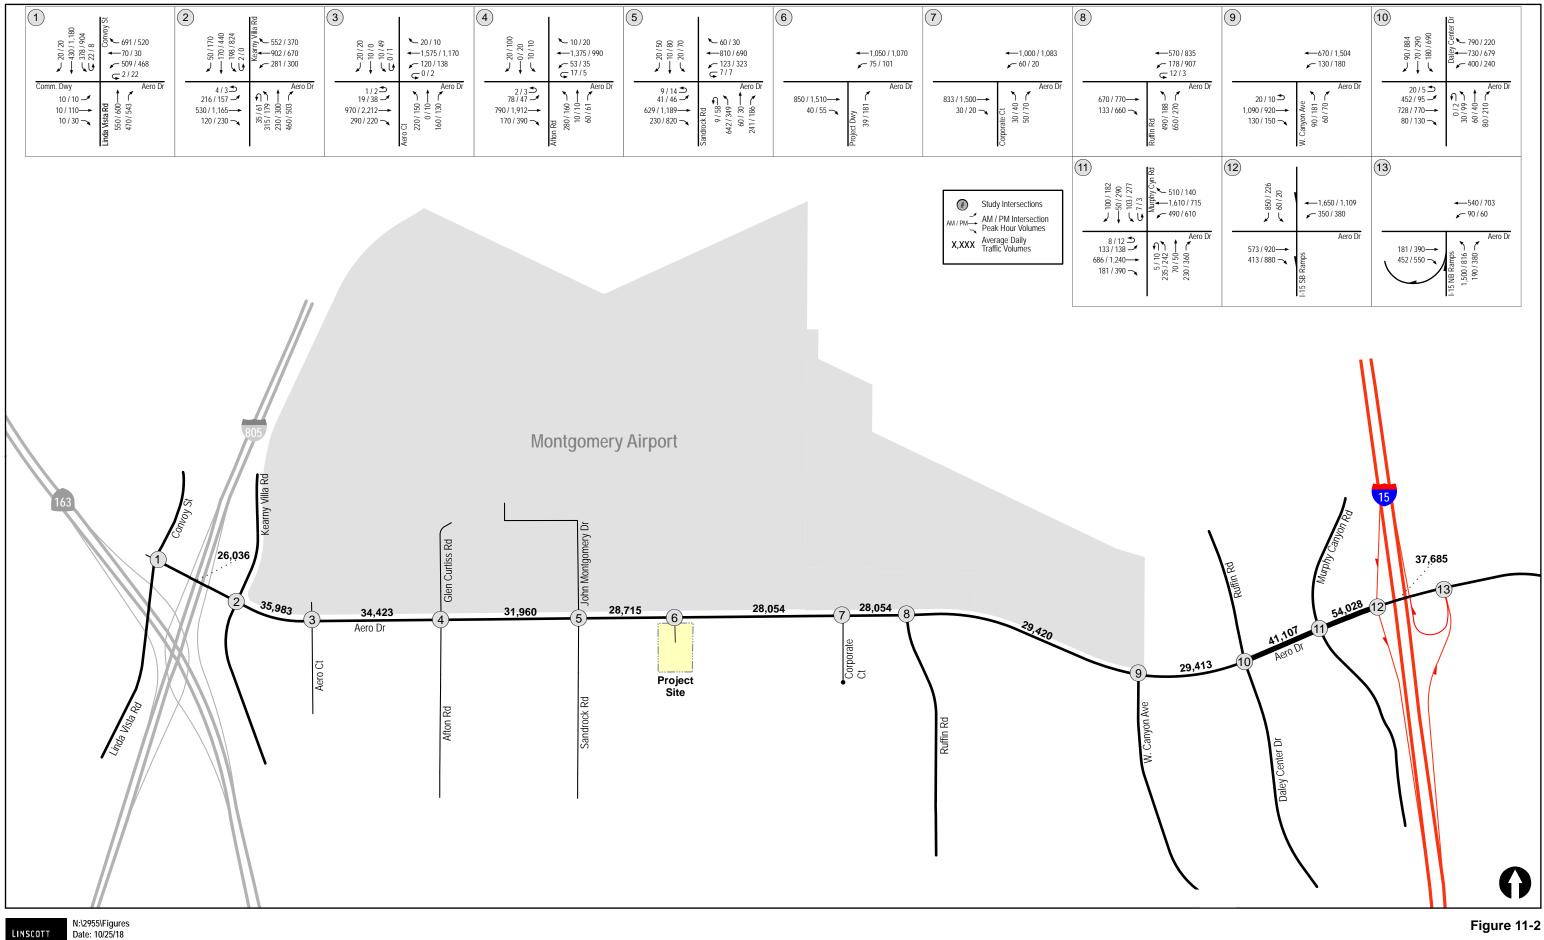

Figure 11-2

#### Long-Term (2035) + Project Traffic Volumes

Aero Drive VA Facility

# 12.0 SITE ACCESS AND CIRCULATION

Access to the site will continue to be primarily from Aero Drive, with one existing driveway being closed. The Project will construct a raised median on Aero Drive along the project frontage in order to satisfy the City's Major Roadway requirements. A median break will be provided to allow for left-turns into the site. Left-turns out of the site will be prohibited. The Project site has a legal easement to access Sandrock Road thru the contiguous properties to the west. Therefore, a portion of the Project trips were assumed to exit via Sandrock Road.

The Project Driveway is calculated to operate acceptably at LOS D under all analysis scenarios. A 95<sup>th</sup> percentile outbound right-turn queue of 101 feet (approximately 4 vehicles) is calculated during the PM peak hour under Year 2035 conditions. A 95<sup>th</sup> percentile inbound left-turn queue of 30 feet (or approximately one to two vehicles) is calculated during the PM peak hour under Year 2035 conditions. The queuing analysis sheets are included in *Appendix J*.

## 13.0 PARKING

The Project proposes to provide a 138,915 SF Veterans Affairs Hospital Annex. Based on the City of San Diego's parking requirement of 3.5 spaces per 1,000 SF per LDC Section 142.0530, Table 142-05G for medical office use with the project being located in the 2035 Transit Priority Area (TPA), a minimum of 487 parking spaces are required. The project site will provide 637 spaces, including 525 standard stalls, 25 accessible stalls, 44 clean air / carpool / vanpool stalls, 33 electric vehicle stalls and 10 motorcycle stalls, and will therefore exceed the City's minimum parking requirement.

# 14.0 TRANSPORTATION DEMAND MANAGEMENT

The project includes a Transportation Demand Management Program that includes the following measures:

- Carpool/vanpool parking spaces will be provided in preferentially located areas (closest to building entrances) for use by qualified employees. These spaces will be signed and striped "Car/Vanpool Parking Only". Information about the availability of and the means of accessing the car/vanpool parking spaces will be posted on Transportation Information Displays located in back-offices, common areas or on intranets, as appropriate.
- The project will maintain an employer network in the SANDAG iCommute program and employees will be offered the opportunity to register for commuter ridematching provided through publicly sponsored services (e.g., SANDAG sponsored "iCommute Ridetracker" or similar program).
- The project will reduce the demand for trips by participating in the Veterans Affairs Veterans Transportation Program which dedicates Veterans Affairs resources to subsidize carpool, vanpool, and transit travel options.
- The project is within <sup>1</sup>/<sub>4</sub>-mile of numerous services that reduce the need to drive including the following (map provided in *Appendix M*):
  - Cafes, restaurants, and dry cleaners available in the Olympus Corsair project which is on the southwest corner of Aero Drive and Sandrock Drive;
  - Cafes, restaurants, and other commercial services such as cleaners and a barber shop in the commercial shopping center on the northwest corner of Aero Drive and Sandrock Drive;
  - A café located to the west in the building immediately adjacent to the project site; and
  - The Serra Mesa-Kearny Mesa Branch library which includes numerous resources such as computer and internet access to the east of the project site on the south side of Aero Drive.

Additionally, the project is 2,135 feet from the social security office and there are two bus stops that are 1,375 feet from each other which further provide access to the social security office while reducing trips.

# **15.0** SIGNIFICANCE OF IMPACTS AND MITIGATION MEASURES

Based on the City of San Diego's significance criteria, a significant impact is calculated at the intersection of Aero Drive / Sandrock Road under Existing + Project and Long-Term (Year 2035) + Project conditions.

It is recommended that the Project reconfigure the northbound and southbound approaches, currently controlled with split signal phasing, to provide protected left-turn signal phasing on the northbound and southbound approaches. The northbound approach would be restriped to provide two dedicated left-turn lanes and a shared thru / right-turn lane. Modifications to the southbound approach include replacing the existing 9-foot center raised median with a 4-foot raised median and restriping to provide a shared thru / right-turn lane, a 10-foot painted median with chevron markings and a dedicated left-turn lane. A concept plan showing the recommended improvements is included in *Appendix I*.

As shown in *Tables 15-1* and *15-2*, the recommended improvement to the northbound and southbound approaches of Aero Drive / Sandrock Road would mitigate the Project's significant impact to below a level of significance. *Appendix J* contains the post mitigation intersection analysis sheets.

 TABLE 15–1
