APPENDICES

1. INTRODUCTION

This report describes the proposed storm water drainage improvements for the Lumina II entitlement submittal. The Lumina II project is owned by Colrich, and represents a portion of the Otay Mesa Central Village Specific Plan (CVSP) area. The TM development proposes development consistent with the land use designations of the approved Specific Plan. The overall drainage criteria for the project was identified in the technical report for the Specific Plan, entitled *Preliminary Drainage and Water Quality Summary for the Otay Mesa Central Village Specific Plan* (PTS 408329), which was prepared by Project Design Consultants and is dated January 22, 2016. Subsequent to the development of the Specific Plan report, Project Design Consultants prepared a Tentative Map for the Lumina Project (PTS# 555609) and the project-level drainage study for the Lumina project is dated August 15, 2018. At the time of the development of the Lumina TM, the Cutberto property which is now know as the "Lumina II Project" was not owned by Colrich, but was subsequently acquired. Therefore, this subsequent entitlement is for the Lumina II property which eventually will be developed as port of the overall Lumina project site plan, but a separate entitlement is required. The project is located South of the 905 highway along Cactus Road and northwest of the Siempre Viva intersection. See Figure 1 for a Vicinity Map.

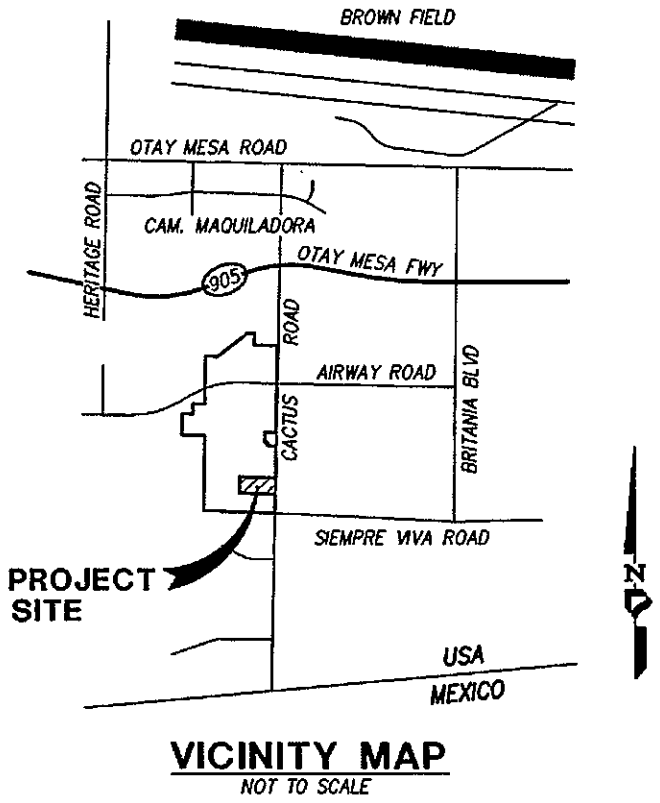

Figure 1: Vicinity Map

2. PROJECT BACKGROUND & RELATION TO PREVIOUS STUDIES

The project site was previously included in the drainage area evaluated in the preliminary Lumina Drainage Study (PTS #555609) because the Lumina project surrounded the Lumina II parcel and therefore incorporated the runon into the overall study. The Lumina II parcel was modeled in the previous study with an ultimate condition runoff coefficient for a multi-unit housing site. Therefore, project-level drainage analysis was already evaluated in the previous report. This Lumina II report, as a supplement document to the approved Lumina Drainage Study, shows that this Lumina II project is in compliance with the drainage criteria.

3. EXISTING AND PROPOSED DRAINAGE PATTERNS AND IMPROVEMENTS

The following sections provide descriptions of the existing and proposed drainage patterns and improvements for the project.

3.1 Existing Drainage Patterns

The site currently has a single family home and a wood shed on the western edge of the project. The rest of the site consists of dirt, shrubs, and trees. Topography within the project site is characterized by mostly gently sloping areas. There are currently minimal drainage improvements within the project boundary. The site drains to the south across the property boundary into the Lumina property, which is also owned by Colrich. From an overall perspective , the site drains to the south to a steep finger canyon (Wruck Creek) located to the west of the existing Cactus Road/Siempre Viva Road intersection. Two of the finger canyons drain to sump areas that are collected and drained to the west and discharged downstream within the canyon via an existing RCP storm drain per City Drawing 23871-21-D.

3.2 Proposed Drainage Improvements

The proposed drainage patterns and drainage improvements have been designed to mimic existing drainage patterns. All proposed drainage improvements from the Lumina II project can be found within the Lumina Drainage Study (PTS#555609) and will be further refined during final engineering. Because the ultimate condition for the Lumina II project was already evaluated in the Lumina Drainage Study, no further calculations are required. The drainage improvements for the proposed Lumina II project will drain into the storm drain improvements for the Lumina project, and the drainage will be detained in the proposed Lumina South Basin.

4. HYDROLOGY CRITERIA, METHODOLOGY, AND RESULTS

The hydrologic analysis was performed for the overall Lumina site (which included Lumina II) and can be found in the approved Lumina Drainage Study (PTS#555609), which is included in this submittal for reference. This Lumina II report does not include additional hydrologic analysis because the project site is the same land use as assumed in the previous study (multi-unit housing).

5. CONCLUSION

The proposed project development complies with detention criteria outlined in previous studies, and therefore, should not adversely affect downstream drainage conditions. The storm drain infrastructure in the Lumina Drainage Study (PTS#555609) will be adequate to convey the design flows and will be addressed regionally for both the Lumina and Lumina II projects. The storm drain detention facilities are designed as combined facilities for hydromodification and water quality purposes in addition to peak flow detention.

TABLES

APPENDICES

1. INTRODUCTION

This report describes the existing and proposed storm water drainage improvements for the Lumina Tentative Map (TM) submittal. The Lumina project is owned by Colrich, and represents a portion of the Otay Mesa Central Village Specific Plan (CVSP) area. The TM development proposes development consistent with the land use designations of the recently approved Specific Plan. The overall drainage criteria for the project was identified in the technical report for the Specific Plan, entitled *Preliminary Drainage and Water Quality Summary for the Otay Mesa Central Village Specific Plan* (PTS 408329), which was prepared by Project Design Consultants and is dated January 22, 2016. The Specific Plan designated land uses within the proposed village area to accommodate future development consistent with the Otay Mesa Community Plan Update. Consistent with the land use designations applied to the site by the CVSP, the TM proposes development of Medium High Density Mixed-Use, Medium Density Multi-Family, Low Density Multi-Family, Public School Facilities, Recreation, and Open Space land uses.

This TM report builds upon the programmatic level drainage analysis in the Specific Plan and addresses the project-specific level analysis required for the Colrich parcels currently proposed per the Lumina TM. The project proposes a TM application for a 93.43-acre site located north of Siempre Viva Road and west of Cactus Road in the Otay Mesa community of the City of San Diego within the CVSP area. See Figure 1 for a Vicinity Map. The project proposes to impact small drainages in the canyons of the northern and southern project limits. We have mapped jurisdictional non-wetland Waters of the US (WUS) in these drainages. As such, we're anticipating needing agency permits (Corps 404, CDFW 1602, and RWQCB 401). We've got this in our scope and will be doing the fieldwork soon to update the delineation mapping.

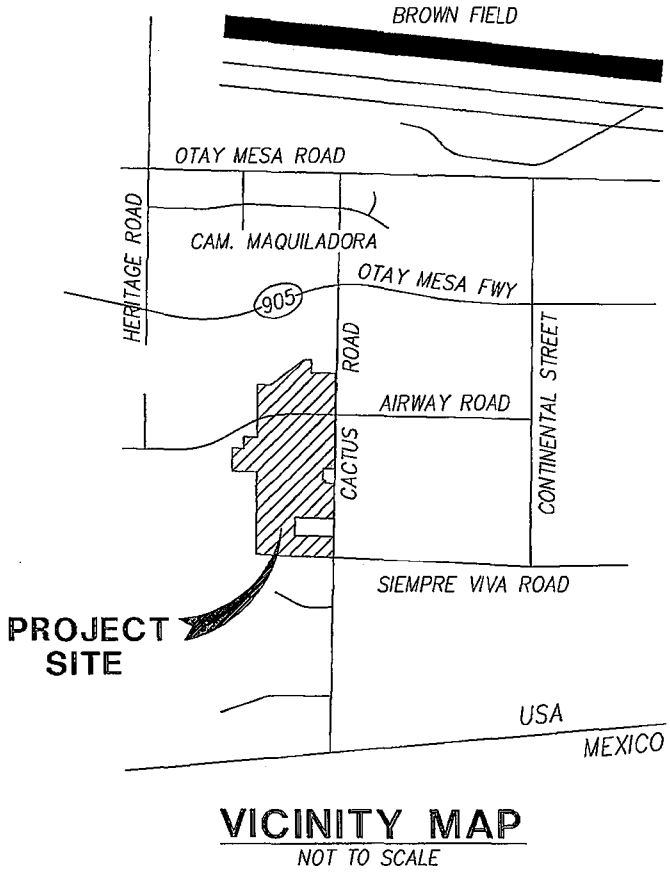

Figure 1: Vicinity Map

2. PROJECT BACKGROUND & RELATION TO PREVIOUS STUDIES

This report builds on the work done previously for the CVSP. The work done for the CVSP was based on the Otay Mesa Community Plan Update (CPU) and its associated EIR. Specifically, the Otay Mesa CPU Drainage Study that was part of the EIR outlined the drainage and water quality requirements for future development within Otay Mesa and identified some of the regional drainage and flooding issues within the area. The report is titled *Drainage Study for the Otay Mesa Community Plan Update*, and was prepared by Kimley-Horn and Associates in April 2007. Included in that report is as a companion study entitled *Review of Otay Mesa Drainage*

Studies, prepared by Tetratech. For a copy of this previously approved CPU Drainage report, refer to Appendix 4.

The report outlines the history and drainage challenges associated with the development of the Otay Mesa Community Plan Area. For example, for most of its early history, Otay Mesa was used for agriculture and farming. As industrial and commercial development started taking place in the 1960s, the City of San Diego recognized the need for a comprehensive drainage Master Plan for the Mesa. The topography of the majority of the area is mostly flat and some of the areas experience flooding during moderate storm events, particularly within the East Watershed (per the Watershed Map in the CPU Drainage Study). There was concern that the new development would increase the stormwater runoff crossing the border into Mexico. In 1987, the City Council approved a contract to prepare the Otay Mesa Master Drainage Plan and published a Notice to "All Private Engineers" that established drainage requirements for development within the East Watershed of Otay Mesa. (Refer to page 2 of the CPU Drainage Study). The Notice required no increase in the rate of stormwater runoff from the property after development, by construction of stormwater detention basins. Most of the drainage analysis associated with the CPU Drainage Study focused on the East Watershed, but the CPU Drainage Study also addressed the other areas within the CPU boundary. The Central Village Specific Plan is within the West Watershed, which is less developed than the East Watershed but still has some of the same drainage challenges. Per Section VII of the CPU Drainage report, the following describes the recommended drainage design criteria for future development within the West Watershed (which includes the Specific Plan Area):

> The West Watershed consists of smaller Mesa-top watersheds that drain into the tributary canyons of Spring Canyon. All of the flow from the watershed flows into Mexico at the Spring Canyon concentration point. Detention basins will be required to reduce the post-development peak flows to predevelopment levels for the 50-year and 100-year storm. If the detention basins concentrate flows at the upper edge of canyons, care must be taken to ensure that erosion potential is not increased downstream.

Therefore, the requirements of the West and East watersheds are different. While developments in the East watershed requires conformance with the Notice to "All Private Engineers", the West

watershed is not subject to the same requirements, but it is subject to the 50-year and 100-year storm detention requirement, as outlined in the above paragraph.

Subsequent to the preparation of the previous Otay Mesa Drainage Studies, Caltrans has built the new State Route 905 and there have been other changes and development within the watershed. Some of the regional drainage improvements proposed in the original studies and master plans to alleviate regional flooding issues have still not been resolved. Therefore, this report follows the the guidance for future development established with the Specific Plan, specifically the requirement for detention. The guidance will require compliance with the overall goals of the CPU (reduce post-development peak flows) and will also require compliance with the applicable stormwater quality regulations.

3. EXISTING AND PROPOSED DRAINAGE PATTERNS AND IMPROVEMENTS

The following sections provide descriptions of the existing and proposed drainage patterns and improvements for the project.

3.1 Floodplains

The project is located within an area of the non-printed FEMA Firm Panel 06073C2200G. Per the FIRM index sheet, the panel is not printed is because there are no special flood hazard areas within the panel sheet. Therefore, there are no FEMA special flood hazard areas within the project. However, although there is no FEMA special flood hazard areas, there may be areas of localized flooding in the canyon and other drainage concentration points.

3.2 Existing Drainage Patterns

The site is currently used for agricultural uses, and there are a few residences and buildings scattered through the site. Topography within the project site is characterized by mostly gently sloping areas, with portions of the perimeter of the property within steep canyon areas. There are currently minimal drainage improvements within the project boundary. The majority of the project drains to the south to a steep finger canyon (Wruck Creek) located to the west of the

existing Cactus Road/Siempre Viva Road intersection. Two of the finger canyons drain to sump areas that are collected and drained to the west and discharged downstream within the canyon via an existing RCP storm drain per City Drawing 23871-21-D. A large portion of the project area drains to the northwest to a canyon (North tributary of Spring Canyon) on the north side of the proposed Airway Road. A small portion of the project area (Cactus Road north of Airway Road) drains to the north along Cactus Road and drains into a culvert underneath Cactus Road. After crossing Cactus Road, the runoff commingles with other runoff draining from upstream areas including Caltrans right-of-way and then drains to the upstream point of the North Canyon.

See Exhibit A in Appendix 5 for the existing condition hydrology maps. Onsite drainage is divided generally into two main drainage areas, North and South. The Southern systems include Systems 100 and 200, and the Northern systems include Systems 300 and 500. They include the following areas:

System 100: System 100 represents the area that drains to the south towards the finger canyon near the southerly property line near the existing eastern headwall per Drawing 23871-21-D.

System 200: System 200 represents the area that drains to the south towards the existing steep finger canyon that flows in a southerly direction and enters the western headwall per Drawing 23871-21-D.

System 300: System 300 represents the area that drains to the northwest towards the north tributary of Spring Canyon.

System 500: System 500 represents the area that drains to the north along Cactus Road and eventually drains to the culvert that crosses underneath Cactus Road approximately 600 feet to the north of the site.

In order to adequately compare existing flows to proposed flows at each of the project outfalls and to provide a valid comparison, the downstream limits of the existing drainage boundaries

match the limits of the proposed drainage boundaries. This was needed because of the large number of drainage outfalls, and lack of concentration points in the pre-developed condition.

3.3 Proposed Drainage Improvements

The proposed drainage patterns and drainage improvements have been designed to mimic existing drainage patterns. The proposed project will include a storm drain system consisting of inlets, pipes, brow ditches, roof drains, and water quality features/detention basins. Development of the site includes development of the backbone public streets with the associated utilities and the mass grading of the lots for future development. The lots will be developed with a range of land uses, including parks, residential, mixed use, and educational uses.

The proposed drainage improvements include public storm drain infrastructure serving the proposed public streets, and private storm drain improvements serving the private development lots. The backbone storm drain system will provide storm drain stubs to serve the proposed developable lots. The lots will be developed in phases.

Refer to Exhibit B for the proposed conditions hydrology map. The Southern systems include Systems 1000 and 2000, and the Northern systems include Systems 3000, 4000, and 5000. They include the following areas:

System 1000: System 1000 represents the area that drains to the south and into proposed Basin 1 (combined biofiltration/hydromodification/detention). The outlet of Basin 1 drains towards the existing eastern headwall per Drawing 23871-21-D.

System 2000: System 2000 represents the runon area draining onto the site from upstream areas to the west of the property. It also collects the portion of the future Trails Park. The drainage area drains towards the existing western headwall per Drawing 23871-21-D.

System 3000: System 3000 represents the drainage area that drains to the northerly canyon, but bypasses Basin 4. The drainage area includes a portion of Airway Road.

Airway Road will be extended to the west in the future by others with subsequent developments to the west.

System 4000: System 4000 represents the drainage area that drains to the northwest to Basin 4 and then outlets to the proposed storm drain outfall to the northerly canyon. Basin 4 is a combined biofiltration/hydromodification/detention basin. Note that a portion of existing Airway Road east of Cactus Road drains to the basin, so the ultimate width is used for the sizing calculations, even though the project's proposed widening will be widened to an interim width.

System 5000: System 5000 represents the Cactus Road drainage area that drains to the north along Cactus Road towards the existing culvert located north of the project approximately 600 feet to the north of the site.

4. HYDROLOGY CRITERIA, METHODOLOGY, AND RESULTS

The site was modeled for existing and proposed conditions to prevent any downstream impacts or increase in flow rates. Site hydrology was assessed to generate hydrographs to route through the basins being designed in concert with hydromodification criteria. Please see the Preliminary Hydromodification Management Study by Project Design Consultants for additional information regarding basin and outflow structure design.

4.1 Hydrology Criteria

Table 1 summarizes the key hydrology assumptions and criteria used for the hydrologic modeling.

Table 1: Hydrology Criteria

Existing and Proposed Hydrology:	100-year storm frequency
Soil Type:	Hydrologic Soil Group D

Land Use / Runoff Coefficients:	Assigned for each drainage area based on estimated percent imperviousness (C values range from C=0.45 to C=0.95).
Rainfall intensity:	Based on intensity duration frequency relationships presented in the 1984 City of San Diego Drainage Design Manual

4.2 Hydrologic Methodology

The Rational Method was used to determine the onsite 100-year storm flow for the design of the Project storm drainpipe improvements. The goal of this analysis was to:

- Determine the design flows for the sizing of storm drainpipe improvements.
- Determine project flows that will be conveyed by the storm drainpipe systems within the project.
- Determine the differences in the drainage conditions between existing and proposed conditions for sizing of detention facilities.

The Rational Method was used to calculate onsite and offsite runoff for the 100-year storm. CivilD hydrologic computer software was used to model the onsite and offsite drainage basins. Per the *City of San Diego Drainage Design Manual,* hydrologic soil type D was utilized for all calculations. The runoff coefficients were assigned based on the percent imperviousness proposed for each lot.

4.3 Description of Hydrologic Modeling Software

The Civil-D Rational Method Program was used to perform the Rational Method hydrologic calculations. This section provides a brief explanation of the computational procedure used in the computer model.

The Civil-D Modified Rational Method Hydrology Program is a computer-aided design program where the user develops a node link model of the watershed. Developing independent node link models for each interior watershed and linking these sub-models together at confluence points

creates the node link model. The intensity-duration-frequency relationships are applied to each of the drainage areas in the model to get the peak flow rates at each point of interest.

The peak flows at the inlets to the basins were used to generate inflow hydrographs utilizing the RickRatHydro program. This program artificially generates a program based on time of concentration and an expected 2/3rds storm distribution as provided in Figure 6-2 of the Hydrology Manual. These hydrographs could them be routed through the basins to produce the final proposed peak flow. The EPA's Stormwater Management Model (SWMM) was used to route these hydrographs through the basins. For more information on this modeling effort see the Preliminary Hydromodofication Management Report for the project. With these routing efforts it was demonstrated that the appropriate reduction could be achieved. For future submittal SWMM will need to be utilized to demonstrate the 100 year storm is appropriately attenuated as only SWMM is capable representing the hybrid biofiltration system with above and below ground storage.

4.4 Hydrology Results

The proposed detention basins will mitigate peak flows to effectively reduce the post-developed runoff from the site due to the development, consistent with the drainage criteria outlined in the CPU Drainage Study. The basins will have a large subsurface detention area below the biofiltration, such that the combination of surface and subsurface storage will mitigate for peak-flow and hydromodification management. Detention routing will be performed for subsequent submittals. Table 2 below summarizes the Rational Method results for the key areas of interest.

Table 2: Hydrology Results

	EXISTING CONDITIONS			PROPOSED CONDITIONS		
Outfall of Interest	***System***	***Q_{100} (cfs)***	***Contrib. Area (acres)***	***System***	***Q_{100} (cfs)***	***Contrib. Area (acres)***

South	System 100	28.4	20.7	System 1000	151.6 undetained 36.2 detained	63.4
	System 200	54.0	49.3	System 2000	10.2	8.2
	Subtotal:	**82.4**	**70.0**	**Subtotal:**	**46.4**	**71.6**
	Total:	**131.8**	**107.8**	**Total:**	**70.6**	**108.3**

5. HYDRAULIC CRITERIA, METHODOLOGY, AND RESULTS

Hydraulic calculations will be performed during final engineering. The preliminary design for each basin includes additional depth for freeboard.

6. CONCLUSIONP

Proposed project development complies with detention criteria outlined in previous studies, and therefore, should not adversely affect downstream drainage conditions. The proposed onsite storm drain infrastructure will be adequate to convey the design flows. The storm drain

detention facilities are designed as combined facilities for hydromodification and water quality purposes in addition to peak flow detention.

APPENDIX 1

Intensity Duration Frequency Curve and Runoff Coefficients

TABLE 2

RUNOFF COEFFICIENTS (RATIONAL METHOD)

DEVELOPED AREAS (URBAN)

Land Use	Coefficient, C Soil Type (1)
Residential:	D
Single Family	.55
Multi-Units	.70
Mobile Homes	.65
Rural (lots greater than 1/2 acre)	.45
Commercial (2) 80% Impervious	.85
Industrial (2) 90% Impervious	.95

NOTES:

(1) Type D soil to be used for all areas.

(2) Where actual conditions deviate significantly from the tabulated imperviousness values of 80% or 90%, the values given for coefficient C, may be revised by multiplying 80% or 90% by the ratio of actual imperviousness to the tabulated imperviousness. However, in no case shall the final coefficient be less than 0.50. For example: Consider commercial property on D soil.

Actual imperviousness = 50%

Tabulated imperviousness = 80%

Revised C = $\frac{50}{80}$ x 0.85 = 0.53

APPENDIX

RAINFALL INTENSITY - DURATION - FREQUENCY CURVES for COUNTY OF SAN DIEGO

ELEV.	FACTOR
0–1500	1.00
1500–3000	1.25
3000–4000	1.42
4000–5000	1.60
5000–6000	1.70
DESERT	1.25

To obtain correct intensity, multiply intensity on chart by factor for design elevation.

**** CONFLUENCE OF MAIN STREAMS ****
------------------------------------------------------------------------------
The following data inside Main Stream is listed:
In Main Stream number: 2
Stream flow area =      4.800(Ac.)
Runoff from this stream =      18.504(CFS)
Time of concentration =     7.25 min.
Rainfall intensity =     3.796(In/Hr)
Summary of stream data:

Stream    Flow rate      TC            Rainfall Intensity
 No.       (CFS)       (min)                 (In/Hr)

1      136.805     13.36                  3.036
2       18.504      7.25                  3.796
Qmax(1) =
          1.000 *    1.000 *   136.805) +
          0.800 *    1.000 *    18.504) + =      151.601
Qmax(2) =
          1.000 *    0.543 *   136.805) +
          1.000 *    1.000 *    18.504) + =       92.743

Total of 2 main streams to confluence:
Flow rates before confluence point:
     136.805      18.504
Maximum flow rates at confluence using above data:
      151.601       92.743
Area of streams before confluence:
       58.590        4.800

Results of confluence:
Total flow rate =     151.601(CFS)
Time of concentration =     13.357 min.
Effective stream area after confluence  =      63.390(Ac.)

San Diego County Rational Hydrology Program

CIVILCADD/CIVILDESIGN Engineering Software,(c)1991-2003 Version 6.3

Rational method hydrology program based on
San Diego County Flood Control Division 1985 hydrology manual
Rational Hydrology Study Date: 07/31/18

2357.50 ILLUMINA
PROPOSED CONDITIONS
SYSTEM 4000, FILE: 4000P100

********* Hydrology Study Control Information **********

Program License Serial Number 4049

Rational hydrology study storm event year is 100.0
English (in-lb) input data Units used
English (in) rainfall data used

Standard intensity of Appendix I-B used for year and
Elevation 0 - 1500 feet
Factor (to multiply * intensity) = 1.000
Only used if inside City of San Diego
San Diego hydrology manual 'C' values used
Runoff coefficients by rational method

--------------------------------------------------------------------------
 *********    Hydrology Study Control Information **********
--------------------------------------------------------------------------

Program License Serial Number 4049

--------------------------------------------------------------------------
Rational hydrology study storm event year is  100.0
English (in-lb) input data Units used
English (in) rainfall data used

Standard intensity of Appendix I-B used for year and
Elevation 0 - 1500 feet
Factor (to multiply * intensity)  =  1.000
Only used if inside City of San Diego
San Diego hydrology manual 'C' values used
Runoff coefficients by rational method

++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
Process from Point/Station     5000.000 to Point/Station     5003.000
**** INITIAL AREA EVALUATION ****
------------------------------------------------------------------------------
Decimal fraction soil group A = 0.000
Decimal fraction soil group B = 0.000
Decimal fraction soil group C = 0.000
Decimal fraction soil group D = 1.000
[INDUSTRIAL area type                    ]
Initial subarea flow distance  =  470.000(Ft.)
Highest elevation =  510.000(Ft.)
Lowest elevation =  502.000(Ft.)
Elevation difference =    8.000(Ft.)
Time of concentration calculated by the urban
areas overland flow method (App X-C) =     4.90 min.
TC = [1.8*(1.1-C)*distance(Ft.)^.5)/(% slope^(1/3)]
TC = [1.8*(1.1-0.9500)*( 470.000^.5)/(   1.702^(1/3)]=   4.90
Setting time of concentration to 5 minutes
Rainfall intensity (I) =     4.389(In/Hr) for a   100.0 year storm
Effective runoff coefficient used for area (Q=KCIA) is C = 0.950
Subarea runoff =      1.501(CFS)
Total initial stream area =       0.360(Ac.)

Pond Volume Equations
* Incremental volume computed by the Conic Method for Reservoir Volumes.

Volume = (1/3) * (EL2 - El1) * (Area1 + Area2 + sqr(Area1 * Area2))

where:	EL1, EL2	Lower and upper elevations of the increment
	Area1, Area2	Areas computed for EL1, EL2, respectively
	Volume	Incremental volume between EL1 and EL2
