

# BELLA MAR

## LOCAL MOBILITY ANALYSIS

JANUARY 2021

PTS #: 631240

PREPARED BY:  
**Kimley»Horn**

## EXECUTIVE SUMMARY

This Local Mobility Analysis (LMA) evaluates the potential traffic effects associated with the proposed Bella Mar project. The City of San Diego (City) Draft Transportation Study Manual (TSM) dated June 2020 was used to develop this LMA. A Vehicle Miles Traveled (VMT) analysis was also performed per CEQA, and the results are provided in a separate memorandum provided in **Appendix M**. The results of the VMT analysis indicated the project has less than significant transportation impacts per CEQA.

The proposed project is located the Otay Mesa-Nestor Community Planning area, east of Imperial Beach and south of the City of Chula Vista. The approximately 14-acre site is bounded by Interstate 5 (I-5) to the west and Hollister Street to the east, between Palm Avenue to the south and Main Street to the north.

The Bella Mar project is proposing to construct 380 multi-family residential units—including 100 affordable housing units. The project requires a General Plan, Community Plan Amendment, and Local Coastal Program Land Use Amendments; Rezone, a Site Development Permit, a Coastal Development Permit, a Tentative Map, Neighborhood Development Permit, an MHPA Boundary Line Adjustment, and the rescinding of the existing Conditional Use Permit.

### Project Information

The project will involve construction of a 380-unit multi-family dwelling unit building on a currently empty lot located at 408 Hollister Street between Main Street and Palm Avenue. The project includes 100 affordable units. The entire project is planned to be constructed in one phase. Access to the site will be established through construction of two unsignalized full-access driveways on Hollister Street.

The *San Diego Municipal Code, Land Development Code, Trip Generation Manual (Rev. 2003)*, was referenced to calculate the estimated trip generation for the site. The driveway trip generation rate of 6 trips per dwelling unit for *Multiple Dwelling Unit – Over 20 dwelling units/acre* was used to estimate trips for the project. As per The City of San Diego's draft TSM, a 10% daily trip reduction and 14% AM and PM peak trip reduction was then applied to account for the project's proximity within a half-mile of a major transit stop (Palm Avenue Transit Station). The resulting trip generation with the trip reduction is 2,052 daily trips with 156 morning peak-hour trips (31 in, 125 out) and 176 afternoon peak-hour trips (124 in, 52 out). **Table 4-1** summarizes the trip generation for the site.

### Analysis Scenarios

Per the City's TSM, five scenarios were analyzed as part of this analysis, listed below:

- Existing Conditions
- Opening Year (2021) Conditions
- Opening Year (2021) Conditions with Project
- Horizon Year (2050) Baseline Conditions
- Horizon Year (2050) with Cumulative Project
- Horizon Year (2050) Conditions with Project

### Study Area

The study area was determined based on the project's trip assignment and reflects the main access routes to and from the project site, mainly providing access to I-5, Main Street, and Palm Avenue. The study area also includes a half-mile walkshed and bikeshed for evaluating pedestrian, bicycle, and transit facilities. The study area facilities are in three jurisdictions: Caltrans, City of Chua Vista, and the City of San Diego.

### Cumulative Projects

The proposed Otay River Business Park in the City of Chula Vista is currently under construction, and traffic volumes were included in the Opening Year (2021) baseline analysis. The Salt Bay Design District project, also located largely in the City of Chula Vista, is anticipated for construction after opening year for the Bella Mar project. The Salt Bay Design District was not included in future models based on the volumes reflected in the model. Therefore, Salt Bay Design District traffic volumes were included manually in the Horizon Year (2050) baseline analysis.

### Summary of Project Effects and Recommended Improvements

**Table E-1** displays the intersection delay and LOS at all study intersections for the scenarios analyzed. As shown in the table, all intersections would operate at LOS D or better for the scenarios except for the following:

- **Intersection 1** – Main Street & I-5 SB Ramps (Opening Year 2021 direct project effect)
- **Intersection 2** – Main Street & I-5 NB Ramps (Horizon Year 2050 project effect)
- **Intersection 4** – Palm Avenue & I-5 SB Ramps (Horizon Year 2050 project effect)

The Bella Mar project would have a project effect at the intersection of Main Street and I-5 Southbound Ramps starting in Opening Year 2021. Operations at the intersection could be restored to better than baseline conditions by installing a traffic signal or roundabout. However, the City of Chula Vista does not currently have a project at this location for the developer to pay a fair share contribution towards. Therefore, no improvement is required as part of this project.

The project also has cumulative project effects at the Palm Avenue and I-5 southbound ramps intersection and the Main Street and I-5 northbound ramps intersection based on Horizon Year (2050) with Project Conditions. The City of San Diego and City of Chula Vista do not currently have projects identified at these locations for the developer to pay a fair share contribution towards. Therefore, no improvement is required as part of this project.

**Table E-2** displays the daily traffic volumes and LOS at all the study roadway segments for the different scenarios analyzed. As shown in the table, the anticipated project traffic will have project effects at the following roadway segments under the following conditions:

- **Hollister Street** between Main Street and Marian Avenue (Opening Year Plus Project direct project effect)
- **Hollister Street** between Marian Avenue and the North Project Limit (Opening Year Plus Project direct project effect)
- **Hollister Street** between the South Project Limit and Conifer Avenue (Horizon Year Plus Project Cumulative project effect)
- **Hollister Street** between Conifer Avenue and Palm Avenue (Opening Year Plus Project direct project effect)
- **Palm Avenue** between I-5 NB Ramps and Hollister Street (Horizon Year Plus Project Cumulative project effect)

**Table E-3** shows the recommended improvements for the roadway segments with project effects. As part of proposed project Hollister Street will be widened by 16 feet along the project frontage to include a continuous two-way left turn lane and buffered bike lanes, as identified in the Otay Mesa Nestor Community Plan. Two segments of Hollister Street, Main Street to Marian Avenue and Conifer Avenue to Palm Avenue,

will be restriped to include a two-way left turn lane. Parking removal will be required for the southern segment between Conifer Avenue and Palm Avenue to accommodate the restriping.

**Table E-4** displays the freeway speed, density, LOS at all the study freeway facilities for the different scenarios analyzed. As shown in the table, all study freeway facilities would operate at LOS D or better with the addition of the proposed project except for the I-5 Northbound Palm Avenue Off-Ramp, the I-5 Southbound Main Street Off-Ramp, and the I-5 Southbound weave segment between Main Street and Palm Avenue. These segments are expected to operate at LOS E or F during a peak period under Opening Year (2021) Plus Project and / or Horizon Year (2050) Plus Project Conditions. These segments would have minimal effect by the project and no project effect would occur.

**Table E-5** displays the freeway off-ramp 95<sup>th</sup> percentile queue lengths for the study area intersections. This determines whether queue lengths can be expected to affect freeway mainline operations based on the storage length available for the off-ramps. As shown in the table, the following off-ramp will be affected by project traffic:

- I-5 Southbound at Main Street (Horizon Year Plus Project Cumulative project effect)

The queuing issue at this intersection is a result of large growth of volumes associated with cumulative projects and the operational deficiency identified in the intersection analysis. The proposed project contributes a small portion of volumes to this ramp in comparison to the overall growth and would not independently create queues beyond the ramps. Queues could be improved with construction of a signal or roundabout, similar to operational improvements identified. The City of Chula Vista does not currently have a project at this location for the developer to pay a fair share contribution towards. Therefore, no improvement is required as part of this project.

#### Multi-Modal Improvements

The project trip generation assumes a reduction of trips due to the project's proximity to the Palm Avenue Trolley Station. As a result, accessible pedestrian connections to the trolley station are required. Additionally, the Otay Mesa-Nestor Community Plan calls for Class II bike lanes along Hollister Street within the study area. Hollister Street is constrained at the bridge crossing over the Otay River.

Based on the analysis of multi-modal facilities within ½ mile of the project site, the development of the project site will include the following improvements, shown in **Figure E-1**:

- Stripe buffered bike lanes along the project frontage.
- Relocate the southbound bus stop on Hollister Street for Bus Route 932 to be in front of the project site.
- Construct a bus stop on northbound Hollister Street for Bus Route 932 across from the project site.
- Construct a mid-block crossing across Hollister Street on the north side of the southern project driveway.
- Construct non-contiguous sidewalk facilities along the project frontage on southbound Hollister Street
- Construct non-contiguous sidewalk facilities along northbound Hollister Street from the proposed bus stop to the proposed mid-block crossing.
- Construct temporary accessible sidewalk along southbound Hollister Street between the project site and Conifer Avenue.
- Provide decomposed gravel path on northbound Hollister Street for connection to Otay Valley Regional Trail system.

Table E-1 Intersection Level of Service Analysis Summary

Intersection	Jurisdiction	Traffic Control (a)	Peak Hour	Existing Conditions		Opening Year (2021) Conditions		Opening Year (2021) with Project				Horizon Year (2050) Baseline Conditions		Horizon Year (2050) with Cumulative Project Conditions		Horizon Year (2050) with Project Conditions

Notes:

**Bold** values indicate intersections operating at LOS E or F. **Bold and Shaded** values indicate a project effect.

\*\* Delay is beyond calculable values.

(a) Signal = Traffic Signal, SSSC = Side Street Stop Control

(b) Delay refers to the average control delay for the entire intersection measured in seconds per vehicle. At SSSC intersections, delay refers to the worst movement.

(c) LOS calculations based on methodologies outlined in the 6th Edition HCM and performed using Synchro 10.

(d) Project Effect?

Notes:

**Bold** values indicate roadway segments operating at LOS E or F. **Bold and Shaded** values indicate a project effect.

- (a) Existing road classifications are based on field work conducted in November 2018.
- (b) Average Daily Traffic (ADT) volumes for the roadway segments were provided by NDS and measured on April 19, 2017.
- (c) The v/c ratio is calculated by dividing the ADT volume by each respective roadway segment's capacity.
- (d) Roadway Classification the same as Without Project Conditions
- (e) Average Daily Traffic (ADT) volumes for the roadway segments were calculated by applying a growth rates derived from the SANDAG Series 12 Model to the existing volumes. Growth rates can be found in Table 5-2 of this report.
- (f) Roadway Classification the same as With Project Conditions
- (g) Average Daily Traffic (ADT) volumes for roadway segments were calculated by adding a horizon year cumulative project traffic volumes (provided in Appendix L) to the Horizon Year (2050) Baseline Conditions volumes.

**Table E-3** Project Improvements for Roadway Segments

Roadway Segment	Project Effect	Proposed Improvement
<b>Hollister Street</b>		
Main Street to Marian Avenue	Opening year 2021 plus project direct project effect	Prior to issuance of the first building permit, Owner/Permittee shall assure the re-striping of Hollister Street between Main Street and Marian Avenue to add a continuous two-way left turn lane, satisfactory to the City of Chula Vista Engineer and the City of San Diego City Engineer. All improvements must be complete and operational prior to first occupancy.
Marian Avenue to North Project Limit	Opening year 2021 plus project direct project effect	No improvement – this section of roadway is currently not wide enough to re-stripe a two-way left-turn lane
North Project Limit to South Project Limit (Project Frontage)	Opening Year 2021 Plus project direct project effect.	Prior to issuance of the first building permit, Owner/Permittee shall assure by permit and bond the widening of Hollister Street along the project frontage by 16 feet and the restriping of Hollister Street to include two lanes of travel, a continuous two-way left turn lane and buffered bike lanes, satisfactory to the City of San Diego City Engineer. All improvements must be complete and operational prior to first occupancy.
South Project Limit to Conifer Avenue	Horizon year 2050 plus project cumulative project effect	No improvement – this section of roadway is currently not wide enough to re-stripe a two-way left-turn lane
Conifer Avenue to Palm Street	Opening year 2021 plus project direct project effect	Prior to issuance of the first building permit, Owner/Permittee shall assure the re-striping of Hollister Street between Conifer Avenue and Palm Avenue to add a continuous two-way left turn lane, satisfactory to the City of San Diego City Engineer. All improvements must be complete and operational prior to first occupancy. Improvement will require removal of on-street parking along the east side of Hollister Street.
<b>Palm Avenue</b>		
I-5 NB Ramps to Hollister Street	Horizon year 2050 plus project cumulative project effect	No improvement – City of San Diego does not currently have a project on Palm Avenue for the developer to pay a fair share contribution towards

# 1 INTRODUCTION

The following Local Mobility Analysis has been prepared to determine and evaluate potential project effects associated with the proposed Bella Mar project and to recommend project improvements.

## 1.1 PROJECT DESCRIPTION

The proposed project is located at 408 Hollister Street in the Otay Mesa-Nestor Community in the City of San Diego, east of Imperial Beach and south of the City of Chula Vista. **Figure 1-1** depicts the project location in a regional context. The approximately 14-acre site is bounded by Interstate 5 (I-5) to the west and Hollister Street to the east, between Palm Avenue to the south and Main Street to the north. The project site is currently vacant. It is directly south of the Otay River Valley and north of a vacant adjacent site. The east side of Hollister Street has an elevated railroad track for the MTS Trolley Blue Line.

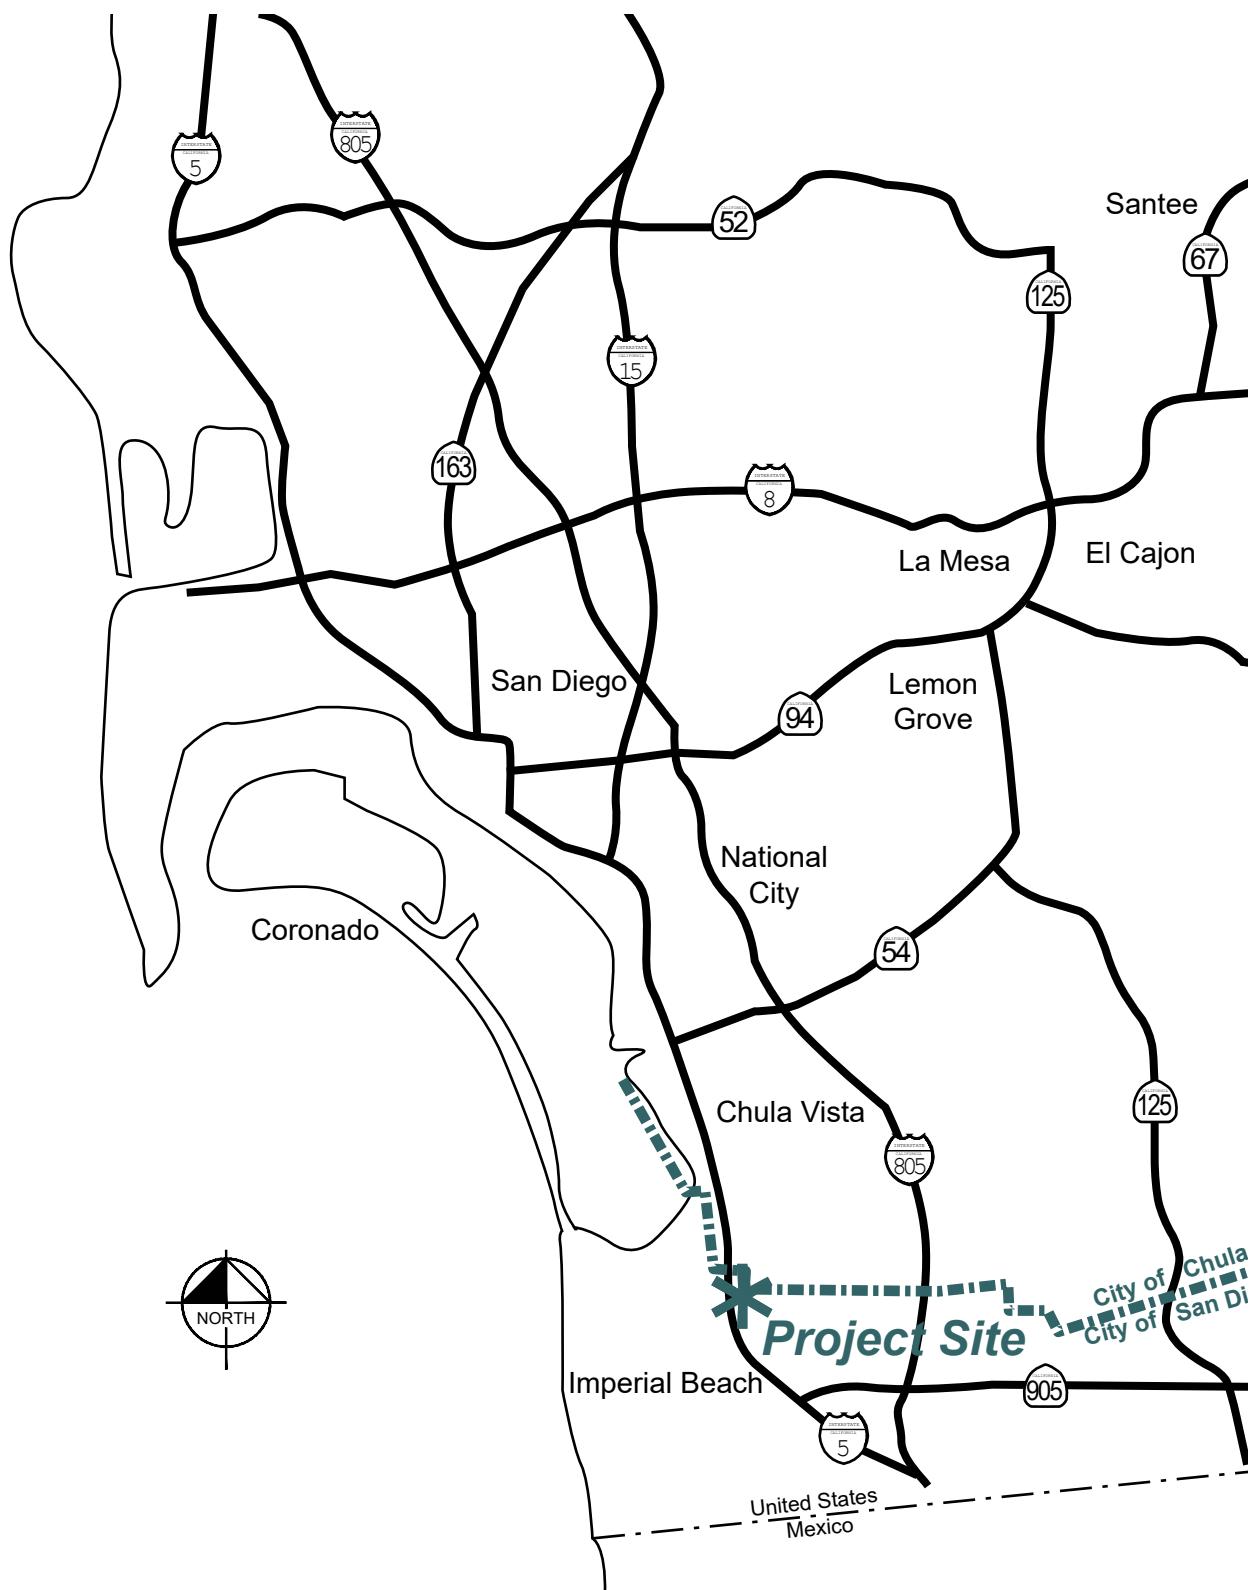

The Bella Mar project is proposing to construct 380 multi-family residential units, including 100 affordable units. Figure 1-2 shows the proposed project site plan. The project requires a General Plan Amendment, a Community Plan Amendment, a Local Coastal Program Amendment, with a Rezone from Agricultural-Residential (AR-1-2) land use to the Residential Multiple-Unit (RM-2-4) zone. The project also requires a Site Development Permit, a Coastal Development Permit, a Tentative Map, a Neighborhood Development Permit, the proposal of a Multiple Habitat Planning Area (MHPA) Boundary Line Adjustment, and the rescinding of the existing Conditional Use Permit No. 96-7318.

## 1.2 ANALYSIS SCENARIOS

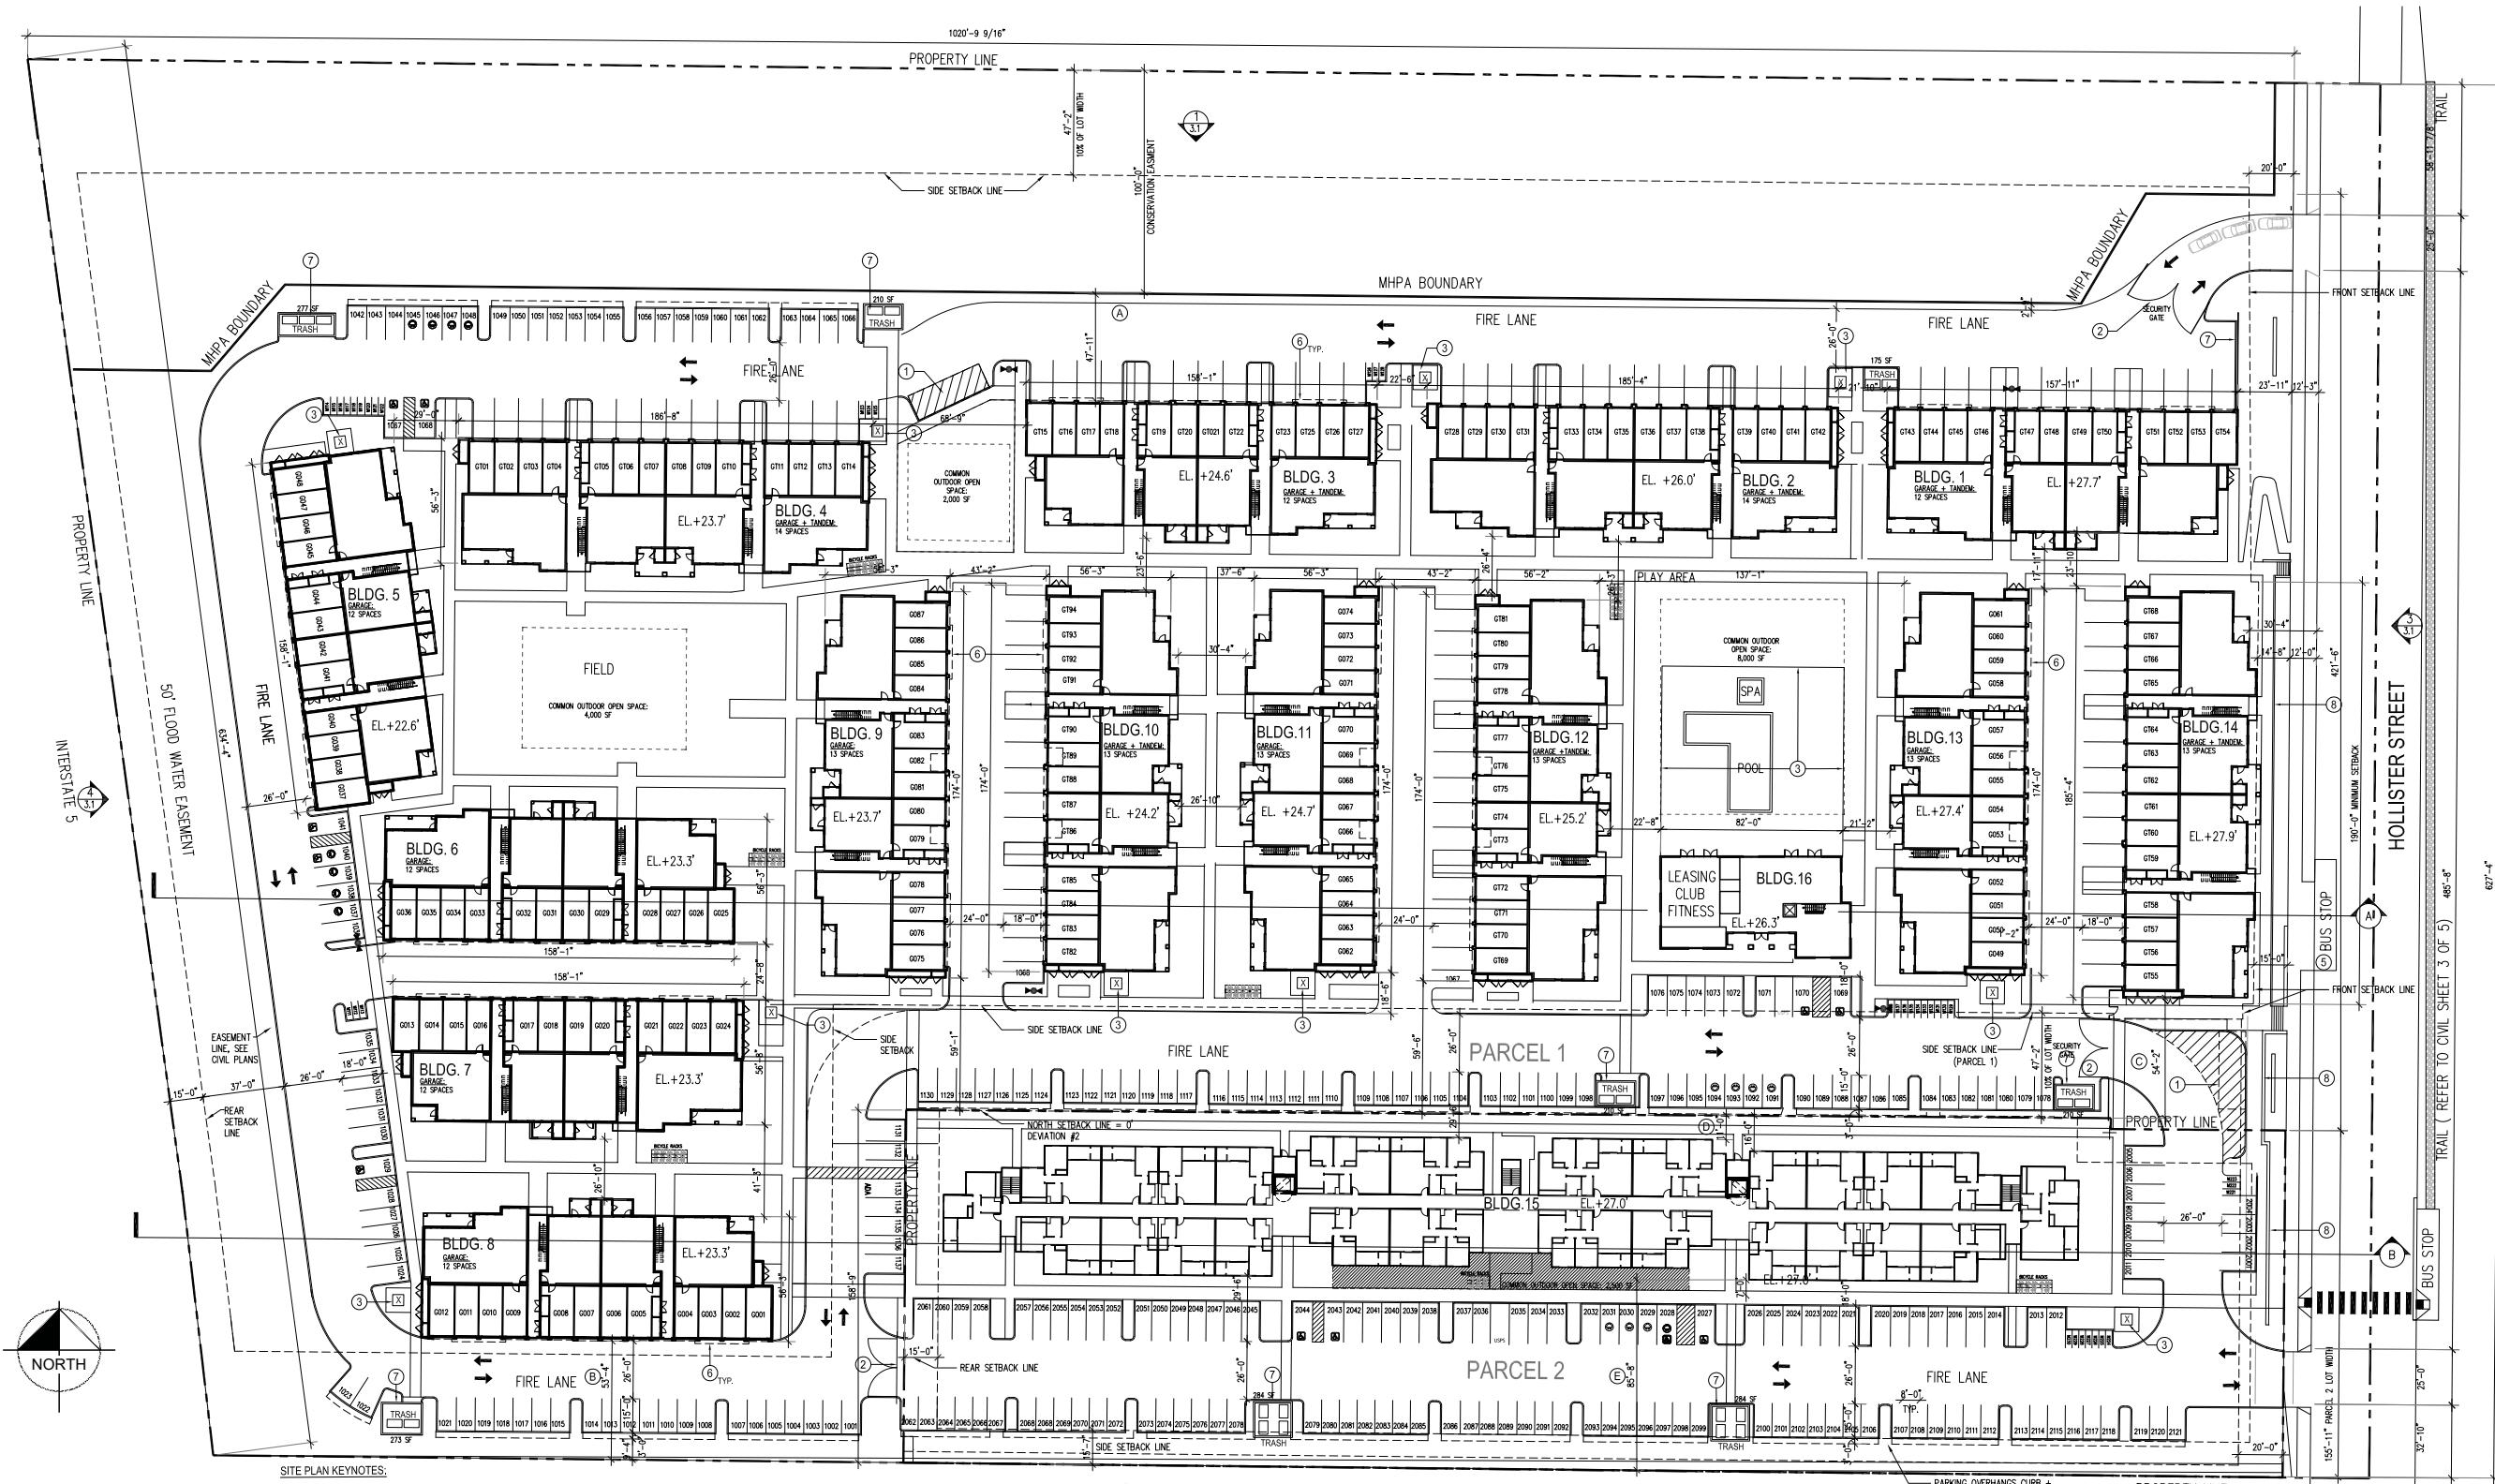

Six scenarios were evaluated as part of this analysis, listed below:

- **Existing Conditions:** Represents the traffic conditions of the existing street network in place in 2020. Traffic counts were collected on Wednesday, April 19, 2017. The data collected on this date are representative of a more conservative baseline than more recent counts taken in 2018. All count data is provided in **Appendix A**. Signal timing data is provided in **Appendix B**.
- **Opening Year (2021) Conditions:** Represents the traffic conditions on the existing street network plus traffic growth per year based on SANDAG's Series 12 model, and the addition of volumes associated with reasonably foreseeable projects in the area.
- **Opening Year (2021) with Project Conditions:** Represents the Opening Year (2021) conditions with the addition of the proposed project traffic. Comparison of this scenario to the Opening Year (2021) Conditions scenario determines direct effects associated with the proposed project.
- **Horizon Year (2050) Baseline Conditions:** Represents the traffic conditions on the existing street network assumed to be in place at community buildout in year 2050. Traffic volumes were estimated using growth rates from SANDAG's Series 12 model.
- **Horizon Year (2050) with Cumulative Project Conditions:** Represents the traffic conditions from the Horizon Year (2050) Baseline Conditions plus the addition of volumes associated with the cumulative project anticipated to be constructed after Opening Year (2021).
- **Horizon Year (2050) with Project Conditions:** Represents the traffic conditions under the Horizon Year with the addition of the horizon year cumulative project and the proposed project traffic. Comparison of this scenario to the Horizon Year (2050) with Cumulative Project Conditions determines cumulative project effects associated with the project.

## 2 METHODOLOGY

The following section describes the methodology used to identify the study area, analyze study area conditions, and determine project effects.

### 2.1 STUDY AREA

The study area was determined based on the City of San Diego's Transportation Study Manual (TSM), as well as the project's expected trip assignment. The study area reflects the main access routes to and from the project site, mainly providing access to I-5, Main Street, and Palm Avenue.

The City of San Diego's TSM determines the extents for pedestrian and bicycle modes based on deficiencies in facilities within a half-mile of the project site. Pedestrian and bicycle facilities, as well as transit stops within a half-mile of each pedestrian access point, are documented and their amenities are evaluated.

Roadway segments should be included in the study area if the following apply:

- The project adds 1,000 or more daily trips and is consistent with the Community Plan, or
- The project adds 500 or more daily trips and inconsistent with the Community Plan.
- In addition to one of the previous, the project either has improvements identified in the community plan or not built to the community plan ultimate classification.

The roadway segments identified for evaluation include:

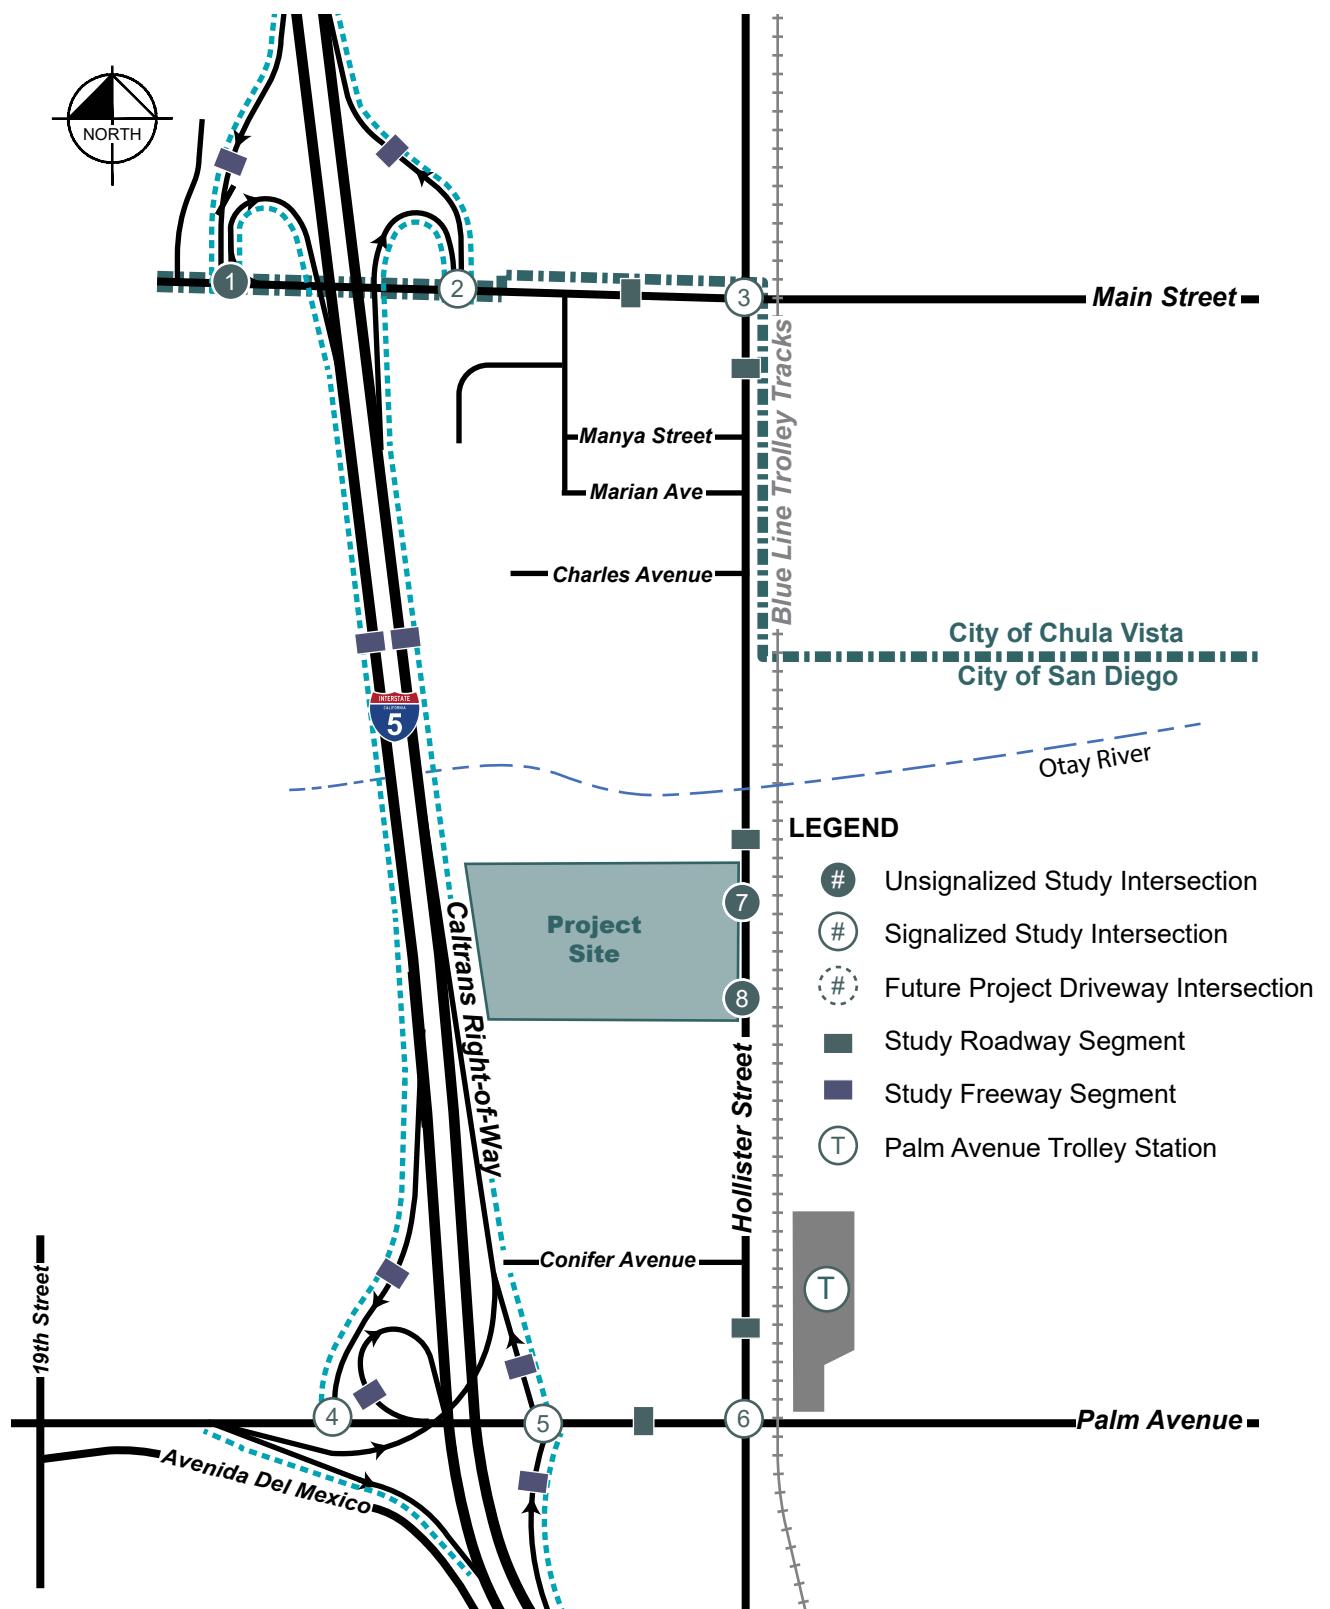

- **Main Street** between I-5 NB Ramps and Hollister Street (Caltrans / Chula Vista)
- **Hollister Street** between Main Street and Palm Avenue (San Diego)
- **Palm Ave** between 19th Street and Hollister Street (represented by the most constrained and project-affected portion, I-5 NB Ramps to Hollister Street) (Caltrans / San Diego)

For projects that generate less than 2,400 daily trips, the following intersections should be included in the study area:

- All signalized intersections and signalized driveways within 0.5 miles of any project driveway that also generate 50 or more peak hour trips to any turning movement
- All unsignalized intersections and unsignalized driveways located within 0.5 miles of any project driveway that also generate 50 or more peak hour trips in either direction
- All freeway ramp terminal intersections where a project adds 50 or more peak hour trips in either direction regardless of distance from the project

The study area facilities, shown in **Figure 2-1**, are within three jurisdictions: Caltrans, City of Chula Vista, and the City of San Diego. The intersections identified for evaluation are shown in **Table 2-1**.

**FIGURE 2-1 STUDY AREA**

**Table 2-1** Study Intersections

Intersection	Traffic Control (a)	Jurisdiction
1 Main St & I-5 SB Ramps	SSSC	Caltrans
2 Main St & I-5 NB Ramps	Signal	Caltrans
3 Hollister St & Main St	Signal	San Diego / Chula Vista
4 Palm Ave & I-5 SB Ramps	Signal	Caltrans
5 Palm Ave & I-5 NB Ramps	Signal	Caltrans
6 Hollister St & Palm Ave	Signal	San Diego
7 Hollister St & North Project Driveway	SSSC (b)	San Diego
8 Hollister St & South Project Driveway	SSSC (b)	San Diego

Note:

- (a) Signal = Traffic Signal; SSSC = Side Street Stop Control;
- (b) Project driveway

As shown in Figure 2-1 the freeway facilities identified for evaluation include:

- **I-5 Northbound** Palm Avenue Off-Ramp (Diverge Facility)
- **I-5 Northbound** Palm Avenue Off-Ramp to Main Street On-Ramp (Weave Facility)
- **I-5 Northbound** Main Street On-Ramp (Merge Facility)
- **I-5 Southbound** Main Street Off-Ramp (Diverge Facility)
- **I-5 Southbound** Main Street On-Ramp to Palm Avenue Off-Ramp (Weave Facility)
- **I-5 Southbound** Eastbound Palm Avenue On-Ramp (Merge Facility)
- **I-5 Southbound** Westbound Palm Avenue On-Ramp (Merge Facility)

In addition, queue lengths on the following off-ramps were evaluated:

- I-5 SB Off-Ramp at Main Street
- I-5 NB Off-Ramp at Main Street
- I-5 SB Off-Ramp at Palm Avenue
- I-5 NB Off-Ramp at Palm Avenue

## 2.2 ANALYSIS PROCESS

The City of San Diego TSM provides guidelines for preparing a Local Mobility Analysis (LMA). The analysis process includes determining the operations at the study intersections for the AM and PM commuter peak periods and operations along the roadway segments, as well as documenting pedestrian, bicycle, and transit facilities within the study area. Intersections were measured and quantified using Synchro 10 software. Roadway segments were measured and quantified by the applicable roadway classifications' planning-level capacity and ADT volume. Freeway facilities were measured using HCS 7 software. Analysis results were compared to the applicable Jurisdiction's standards to determine if the project has any project effects.

The Highway Capacity Manual (*HCM*) published by the Transportation Research Board establishes procedures to evaluate highway facilities and rate their ability to process traffic volumes. The terminology

"level of service" is used to provide a qualitative evaluation based on certain quantitative calculations, which are related to empirical values.

### 2.2.1 PEDESTRIANS

Pedestrian analysis includes evaluating the project study area pedestrian facilities (sidewalks and crosswalks) for connectivity gaps, obstructions, or inefficiencies. In addition, locations with substantial pedestrian volumes should be analyzed in accordance with the latest version of the HCM.

### 2.2.2 BICYCLES

Bicycle projects or improvements identified in the City's Bicycle Master Plan or the Community's Bicycle Mobility Element and located within the project study area should be documented. Bicycle facilities within the project study area should also be evaluated for connectivity gaps and adequacy of facilities.

### 2.2.3 TRANSIT

Planned and/or proposed transit improvements identified in the Community's General Plan or the Regional Transportation Improvement Program (RTIP) that are located within the project study area should be documented. The transit system within the study area should be evaluated for the following project effects:

- Anticipated increase in travel time for buses as a result of intersection or corridor delay
- Conflicts involving buses at stop due to nearby driveways

### 2.2.4 SIGNALIZED AND UNSIGNALIZED INTERSECTIONS

Level of service (LOS) for intersections is defined in terms of delay, which is a measure of driver discomfort, frustration, fuel consumption, and loss of travel time. Specifically, LOS criteria for signalized intersections are stated in terms of the average control delay per vehicle for the peak 15-minute period within the hour analyzed. The average control delay includes initial deceleration delay, queue move-up time, and final acceleration time in addition to the stop delay. The criteria for the various levels of service designations for intersections are given in **Table 2-2**.

**Table 2-2** LOS Criteria for Intersections

LOS	Control Delay (sec/veh)		Description
	Signalized Intersections (a)	Unsignalized Intersections (b)	
A	$\leq 10.0$	$\leq 10.0$	Operations with very low delay and most vehicles do not stop.
B	$>10.0$ and $\leq 20.0$	$>10.0$ and $\leq 15.0$	Operations with good progression but with some restricted movement.
C	$>20.0$ and $\leq 35.0$	$>15.0$ and $\leq 25.0$	Operations where a significant number of vehicles are stopping with some backup and light congestion.
D	$>35.0$ and $\leq 55.0$	$>25.0$ and $\leq 35.0$	Operations where congestion is noticeable, longer delays occur, and many vehicles stop. The proportion of vehicles not stopping declines.
E	$>55.0$ and $\leq 80.0$	$>35.0$ and $\leq 50.0$	Operations where there is significant delay, extensive queuing, and poor progression.
F	$>80.0$	$>50.0$	Operations that is unacceptable to most drivers, when the arrival rates exceed the capacity of the intersection.

Source:

(a) 6th Edition Highway Capacity Manual, Chapter 19, Page 16, Exhibit 19-8

(b) 6th Edition Highway Capacity Manual, Chapter 20, Page 6, Exhibit 20-2

LOS for unsignalized intersections is determined by the computed or measured control delay and is defined for each movement. At an all-way stop control intersection, the delay reported is the average control delay of all movements at the intersection. At a one-way or two-way stop control intersection, the delay reported represents the worst movement, which is typically the left-turn from the minor street approach.

Synchro 10 (Trafficware) software was used to analyze the operations of both signalized and unsignalized intersections. Synchro uses the methodologies outlined in the 6<sup>th</sup> Edition Highway Capacity Manual.

The following list contains the assumptions used for the intersection analyses:

- Peak-hour factor (PHF) - Measured in field PHFs were used for Existing and Opening Year (2021) scenarios per approach, a network-wide 0.92 was used for Horizon Year (2050)
- Saturation flow rate – typical saturation flow rate of 1,900 vehicles per hour per lane
- Signal Timing - Existing signal timings were modeled for each signalized intersection for Existing and Opening Day (2021) Conditions
  - Horizon Year (2050) signal timing was optimized

## 2.2.5 ROADWAY SEGMENTS

To determine the effects on the study area roadway segments, capacity thresholds and associated LOS documented in the City of San Diego TSM was utilized and are shown in **Table 2-3**. The segment traffic volumes under LOS E as shown in this table are considered at capacity because at LOS E the v/c Ratio is equal to 1.0.

**Table 2-3** City of San Diego Roadway Segment Capacity and LOS

Road		Level of Service (LOS)				
Class	Lanes	A	B	C	D	E
Expressway	6	30,000	42,000	60,000	70,000	80,000
Prime Arterial	6	25,000	35,000	50,000	55,000	60,000
Major Arterial	6	20,000	28,000	40,000	45,000	50,000
Major Arterial	4	15,000	21,000	30,000	35,000	40,000
Collector	4	10,000	14,000	20,000	25,000	30,000
Collector (Continuous left-turn lane)	2	5,000	7,000	10,000	13,000	15,000
Collector (No fronting property)	2	4,000	5,500	7,500	9,000	10,000
Collector (Commercial/Industrial fronting)	2	2,500	3,500	5,000	6,500	8,000
Collector (Multi-family)	2	2,500	3,500	5,000	6,500	8,000
Sub-Collector (Single family)	2	---	---	2,200	---	---

Notes:

- XXXX = Approximate recommended ADT based on the City of San Diego Street Design Manual.
- The volumes and the average daily level of service listed above are only intended as a general planning guideline.
- Levels of service are not applied to residential streets since their primary purpose is to serve abutting lots, not carry through traffic.
- Levels of service normally apply to roads carrying through traffic between major trip generators and attractors.

Source:

City of San Diego Transportation Study Manual, Table 6.

## 2.2.6 FREEWAY SEGMENTS

LOS for freeway facilities is defined in terms of density, which is measured in passenger cars per mile per lane (pc/mi/ln). The criteria for the various levels of service designations for intersections are given in **Table 2-4**.

HCS 7 software was used to analyze the operations of the freeway. HCS uses the methodologies outlined in the Highway Capacity Manual.

The following list contains the assumptions used for the freeway analyses:

- Freeway Free Flow Speed (FFS) = 75.4 mph
- Ramp Free Flow Speed (FFS) = 35 mph
- Freeway/Ramp Peak Hour Factor (PHF) = 0.94
- Freeway Truck Percentage = 4%
- Ramp Truck Percentage = 2%
- Level Freeway Terrain
- All Familiar Driver Population
- A conservative growth rate of 1.8% per year was used to calculate Opening Year & Horizon Year Freeway Volumes to reflect the highest growth rate in the study based on SANDAG Series 12 model

**Table 2-4** LOS Criteria for Freeway Segments

Level of Service (LOS)	Density (pc/mi/ln)
	Urban Basic Segments
A	≤ 11
B	> 11 – 18
C	> 18 – 26
D	> 26 – 35
E	> 35 – 45
F*	> 45*

Source:

6th Edition Highway Capacity Manual, Chapter 10, Page 15, Exhibit 10-6

\* Demand exceeds capacity

Freeway off-ramps queues were evaluated against the available storage length, to identify queues affecting the freeway mainline. HCM 6<sup>th</sup> edition only provides queues for signalized intersections. As a result, HCM 2000 results were used for the unsignalized intersection of Main Street and I-5 Southbound Ramps.

## 2.3 OFF-SITE IMPROVEMENTS

### 2.3.1 CITY OF SAN DIEGO

The City of San Diego has developed acceptable threshold standards to determine project effects to intersections and roadway segments, as well as considerations for improving multi-modal facilities adjacent to the project site. At intersections, the measurement of effectiveness (MOE) is based on allowable increases in delay and resulting LOS. Along roadway segments, the MOE is based on allowable increases in the v/c ratio. Along freeway facilities, the MOE is based on the allowable increases in density. For active transportation modes, analysis is more qualitative in nature, focusing on connectivity and consistency with planning

documents. **Table 2-5** summarizes the Measures of Effectiveness and recommendations for off-site improvements for the different facilities in the study area.

**Table 2-5** City of San Diego Off-Site Improvement Recommendations for Study Area Facilities

Facility	Measurement of Effectiveness (MOE)	Off-Site Improvement Recommendations
Pedestrian	Connectivity, walkshed, ADA-compliance	<ul style="list-style-type: none"> <li>• Close sidewalk gaps and/or remove obstructions</li> <li>• Construct curb ramps to meet accessibility standards</li> <li>• Accommodate increased pedestrian demand with traffic calming and/or pedestrian related signal timing changes</li> </ul>
Bicycle	Connectivity, bikeshed	<ul style="list-style-type: none"> <li>• Construct bicycle facilities identified in the Community Plan or City Bicycle Master Plan</li> <li>• Accommodate increased bicycle demand with upgrades to existing facilities</li> </ul>
Transit	Travel time, on-time performance, conflict identification	<ul style="list-style-type: none"> <li>• Implement transit priority treatments and/or improvements identified in the Community Plan or at movements that experience LOS E or worse</li> <li>• Accommodate transit demand with additional stops and abiding by the Community Plan, RTIP, SANDAG, MTS, and/or the North County Transit District</li> </ul>
Signalized Intersection	Seconds of delay, queue lengths, project traffic volumes	<ul style="list-style-type: none"> <li>• Add or lengthen a turn lane</li> <li>• Improve/modify signal timing</li> </ul>
Unsignalized Intersection	Seconds of delay, queue lengths, project traffic volumes	<ul style="list-style-type: none"> <li>• Evaluate alternative traffic control such as a signal or roundabout</li> </ul>
Roadway Segment	ADT, v/c ratio	<ul style="list-style-type: none"> <li>• Improve or upgrade facilities identified in the Community Plan</li> </ul>
Freeway	Density (pc/mi <sup>ln</sup> )	<ul style="list-style-type: none"> <li>• Coordinate with Caltrans to improve off-ramp spillbacks onto freeway mainline</li> </ul>

Source: City of San Diego Transportation Study Manual

There are two classes of project effects: direct effects and cumulative effects.

**Project Specific Direct Effects** are those effects that are projected to occur at the time a proposed development becomes operational—i.e., the Opening Year (2021). Project specific direct effects are measured against projected background traffic levels, which include other developments that are not presently operating but which are expected to be operating by 2021 (cumulative projects). The project applicant may be responsible for improvements at all locations with project specific effects.

**Cumulative Traffic Effects** are those projected to occur at some point after a proposed development becomes operational, such as when the affected community plan area reaches full planned build. A fair share contribution towards improvements could be required if a funding source for the remaining funds is identified. A fair share contribution is based on the project's proportionate traffic contribution to the increase in traffic volumes entering an intersection or added to a roadway segment between existing and the Horizon Year (2050) scenario.

For **signalized intersections**, the following considerations should be made for adding or lengthening a turn lane:

- No existing left-turn lane - If the project causes the total number of peak hour left-turn trips to exceed 100, consider adding a left-turn lane
- Existing single left-turn lane – If the project causes the total number of peak hour left-turn trips to exceed 300, consider adding a second left-turn lane
- No existing right-turn lane - If the project causes the total number of peak hour right-turn trips to exceed 500, consider adding a right-turn lane
- Existing single right-turn lane - If the project causes the total number of peak hour right-turn trips to exceed 800, consider adding a second right-turn lane
- If the project causes a turning movement 95<sup>th</sup> percentile queue to exceed the available turn pocket length, consider lengthening the turn pocket

For **signalized intersections**, the following considerations should be made for signal timing improvements or signal modifications such as updating signal split times, adding transit signal priority, adding right-turn overlap phasing, modifying signal phases, or adding/improving Intelligent Transportation Systems (ITS):

- Within a ½ mile path of travel of a major transit stop – If the project causes an intersection to degrade to LOS F, or if the project adds traffic to a signal already operating at LOS F
- Outside of a ½ mile path of travel of a major transit stop – If the project causes an intersection to degrade to LOS E or F, or if the project adds traffic to a signal already operating at LOS E or F

For **unsignalized intersections**, an intersection control evaluation should be conducted to determine the appropriate intersection control improvement if one of the following conditions occur:

- All-way stop-controlled intersection
  - Within a ½ mile path of travel of a major transit stop – if the project causes the intersection to degrade to LOS F, or if the intersection is already operating at LOS F and the project adds traffic to it
  - Outside of a ½ mile path of travel of a major transit stop – if the project causes the intersection to degrade to LOS E or F, or if the intersection is already operating at LOS E or F and the project adds traffic to it
- Two-way stop-controlled intersection
  - Within a ½ mile path of travel of a major transit stop – if the project causes the worst movement to degrade to LOS F, or if the intersection is already operating at LOS F and the project adds traffic to the worst movement
  - Outside of a ½ mile path of travel of a major transit stop – if the project causes the worst movement to degrade to LOS E or F, or if the intersection is already operating at LOS E or F and the project adds traffic to the worst movement

For **roadway segments**, the project should consider implementing improvements identified in the community plan if the project adds greater than 50% off the total daily vehicle trips on the segment. If the project adds less than or equal to 50%, the project should evaluate its fair share contribution towards the improvement

### 2.3.2 CITY OF CHULA VISTA

The City of Chula Vista's Transportation Study Guidelines (TSG) published on June 10, 2020 provides guidance for off-site improvements for vehicular traffic needs summarized in **Table 2-6** and active transportation needs summarized in **Table 2-7**.

**Table 2-6** City of Chula Vista Off-Site Vehicle Improvement Recommendations

Intersection Type	Potential Improvement (Project Responsibility) <sup>1,2</sup>				
	Project Added Peak Hour Trips <sup>8</sup>				
	0%-4%	5%-19% <sup>3</sup>	20%+ <sup>4</sup>		
<b>Signal – Whole Intersection</b>	Signal retiming <sup>5</sup> (100%)	Signal retiming <sup>5</sup> (100%)	Signal Upgrade / ITS <sup>6</sup> (Fair share)	Signal Retiming <sup>5</sup> (100%)	Signal Upgrade / ITS <sup>6</sup> (Fair share)
<b>Signal – Turning Movement</b>	None	Add additional turn lane (Fair share) <sup>7</sup>	Extend existing turn pocket (Fair share) <sup>7</sup>	Add additional turn lane <sup>7</sup> (100%)	Extend existing turn pocket <sup>7</sup> (100%)
<b>All-Way Stop Control</b>	None	Coordinate with City staff to evaluate alternative control, including signalization, roundabout, turn restriction, additional turn lanes			
<b>Side-Street Stop Control</b>	None				

Notes:

<sup>1</sup> All projects are expected to pay applicable impact fees in addition to implementing the project specific improvements.

<sup>2</sup> Certain improvements may not be feasible due to constraints; alternative improvements can be considered with the approval of the City Engineer.

<sup>3</sup> Project that contributes between 5% and 19% of the overall intersection peak hour traffic volumes can make fair share contributions toward the cost of the improvement, in addition to paying applicable impact fees.

<sup>4</sup> Project that contributes 20% or more peak hour traffic volumes to an intersection is required to pay 100% of the improvement cost.

<sup>5</sup> Project is expected to pay 100% of all signal retiming cost.

<sup>6</sup> Signal upgrade / Intelligent Transportation System (ITS) improvements should be consistent with the City of Chula Vista Traffic Signal Communications Master plan and recommendations from City staff. Project's applicant should coordinate with City staff to identify feasible signal upgrade / ITS improvements.

<sup>7</sup> Coordinate with City staff to determine the appropriate improvement measure. Refer to the City of Chula Vista Design and Construction Standard Drawings for turn pocket requirements.

<sup>8</sup> Project added peak hour trips is relative to pre-existing pre-project peak hour trips.

**Table 2-7** City of Chula Vista Multi-Modal Improvement Recommendations

Proximity	Facility Type		
	Pedestrian	Bicycle	Transit
Project Frontage & Adjacent Facilities <sup>1</sup>	<ul style="list-style-type: none"> <li>• Close sidewalk gaps</li> <li>• Remove pathway obstructions</li> <li>• Construct curb ramps per current ADA standards</li> <li>• Implement identified traffic calming measures</li> </ul>	<ul style="list-style-type: none"> <li>• Upgrade substandard bike facilities</li> <li>• Fill gaps in the Planned Bikeway Network</li> </ul>	<ul style="list-style-type: none"> <li>• Add missing transit amenities according to MTS Designing for Transit Guidelines</li> <li>High-quality transit amenities (shelter, trash can, benches, street trees) are encouraged</li> </ul>
Within ¼ Mile of Project	<ul style="list-style-type: none"> <li>• Close sidewalk gaps</li> <li>• Remove pathway obstructions</li> <li>• Implement identified traffic calming measures</li> </ul>	<ul style="list-style-type: none"> <li>• Upgrade substandard bike facilities</li> <li>• Coordinate with City staff to pay fair share towards Planned Bikeways</li> </ul>	

Note:

<sup>1</sup> Adjacent facilities are defined as intersection immediately to the project site. Location of adjacent facilities should be identified in coordination with City's staff prior to conducting an LMA.

## 3 EXISTING CONDITIONS

This section summarizes the existing roadway circulation network, daily and peak-hour traffic volumes, and operations at the study intersections and roadway segments.

### 3.1 ROAD NETWORK

The following provides a description of the existing street system as of January 2021, within the vicinity of the project area. Ultimate roadway classifications are provided in the Otay Mesa-Nestor Community Plan, shown in **Appendix C**.

**Main Street** is currently classified as a four-lane major arterial in the *Chula Vista General Plan*. Within the study area, Main Street is currently built to its classification and provides east-west connectivity through Chula Vista with sidewalk on both sides of Main Street east of the I-5 NB ramp intersection. Bike lanes are not provided and sidewalks do not exist west of the I-5 NB ramp intersection along the north side of the road. The posted speed limit is 35 miles per hour (mph). For intermittent lengths, parking is allowed and left-turn pockets exist. There is a raised median along the study segment.

- **Ultimate Classification:** Four-lane major arterial

**Hollister Street** provides north-south connectivity between City of Chula Vista and City of San Diego and currently functions as a two-lane collector with no center lane between Main Street and Palm Avenue. The roadway conditions vary along Hollister Street between Main Street and Palm Avenue, so the roadway is discussed in three segments below:

*Main Street to Marian Avenue:* The speed limit south of Main Street is 35 mph, parking is allowed on both sides of the street, and contiguous sidewalk is provided on the west side of the street.

*Marian Avenue to Conifer Avenue:* The posted speed limit is 40 mph between Marian Avenue and Conifer Avenue, parking is allowed on the west side of the street except at the Otay River Bridge where the roadway narrows, and sidewalk is not provided on either side of the street.

*Conifer Avenue to Palm Avenue:* The posted speed limit is 30 mph, parking is allowed on both sides of the street and intermittent contiguous and non-contiguous sidewalk exists on the west side of the street. There is approximately 200 feet of contiguous sidewalk along the trolley station frontage on the east side of the street.

The City's Bicycle Master Plan calls for Class II bicycle lanes along Hollister Street within the study area, but no bicycle facilities currently exist. The Bicycle Master Plan describes this as a high priority segment.

- **Ultimate Classification:** Two-lane collector with continuous left-turn lane and Class II bicycle lanes

**Palm Avenue** is a four-lane major road with a raised median between the I-5 SB and I-5 NB ramps, a 6-Lane Major with raised median and intermittent turn lanes west of the I-5 northbound ramps intersection, and a four-lane collector road with a continuous left turn lane east of the I-5 northbound ramps intersection. Palm Avenue runs east-west from Imperial Beach to Interstate 805. The posted speed limit is 40 mph. Street parking is allowed on some sections within the study area on the north side of the roadway. Sidewalk is provided on the north side of Palm Avenue within the study area, and on the south side of Palm Avenue east of the I-5 northbound ramps intersection only. Bike lanes are present east of the trolley station on both sides of the street, but not west of Hollister Street within the study area.

- **Ultimate Classification:** Four-lane major arterial

**Figure 3-1** illustrates the existing intersection and roadway segment geometrics.

## 3.2 TRAFFIC VOLUMES

Peak-hour intersection turning movement counts and 24-hour roadway traffic counts were collected by National Data and Surveying Services (NDS) at the study intersections on Wednesday, April 19, 2017. The City's traffic volume database provides 24-hour traffic count data for the study area roadways. A 24-hour roadway traffic count was obtained by the City of San Diego conducted on Hollister Street between Conifer Avenue and Outer Road on September 27, 2018. The data collected in 2018 was lower than the data collected in 2017, so the 2017 count data was validated, and the 2017 volumes were used for this analysis as a conservative approach. **Appendix A** contains the existing traffic volume data at the study intersections and roadway segments, as well as the 2018 roadway segment data from the City's database.

**Figure 3-2** illustrates the existing traffic volumes at the study intersections and ADT volumes along the roadway segments.

## 3.3 INTERSECTION ANALYSIS

**Table 3-1** displays the LOS analysis results for the study intersections under Existing Conditions. As shown in the table, all intersections currently operate at LOS D or better during both peak periods, except the following intersection:

- **Intersection 4** – Palm Avenue & I-5 SB Ramps (LOS E in the PM Peak)

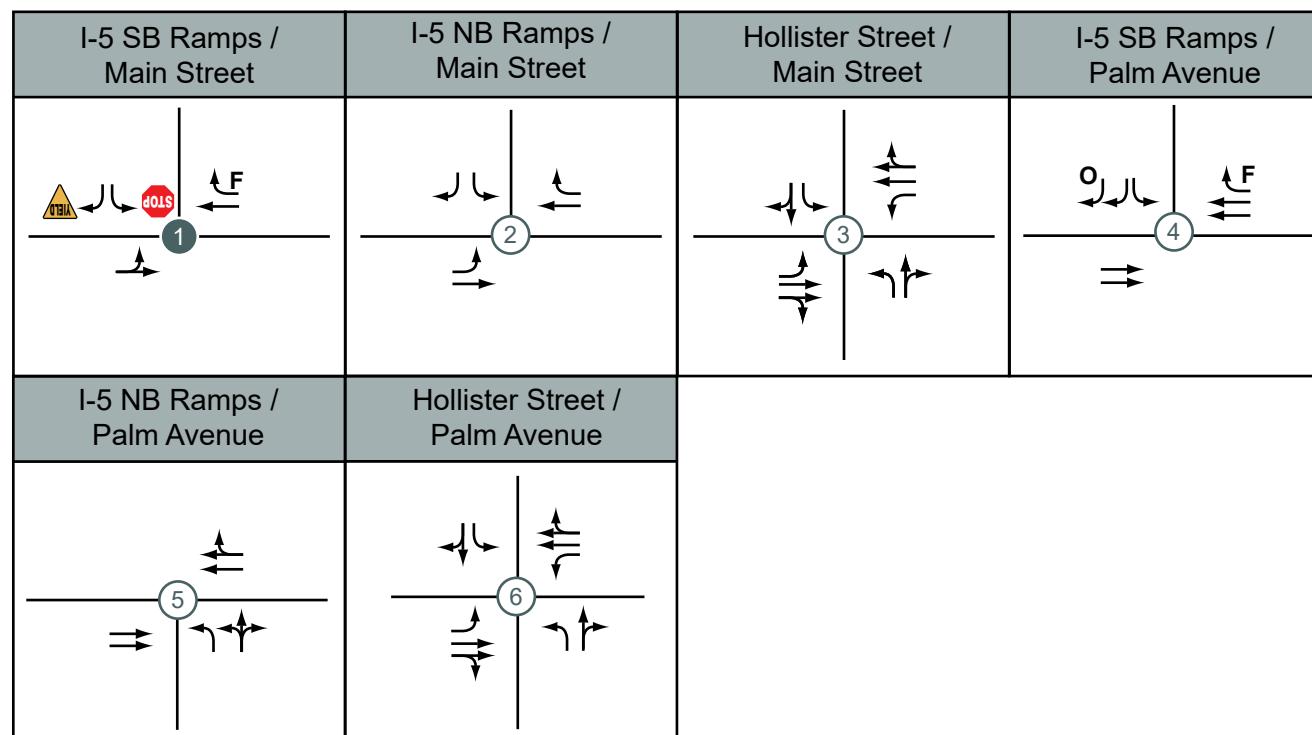

**Appendix D-1** contains the intersection LOS calculation worksheets for Existing Conditions.

## 3.4 ROADWAY SEGMENT ANALYSIS

**Table 3-2** displays the roadway segments analysis under Existing Conditions. As shown in the table, all roadway segments within the study area function at LOS D or better under Existing Conditions except the following:

- **Hollister Street** – Conifer Avenue to Palm Avenue (LOS E)

**Table 3-1** Existing Conditions Intersection LOS Summary

Intersection		Jurisdiction	Traffic Control (a)	Peak Hour	Existing Conditions	
					Delay (b)	LOS (c)
1	Main Street & I-5 SB Ramps	Caltrans	SSSC	AM	14.5	B
				PM	26.2	D
2	Main Street & I-5 NB Ramps	Caltrans	Signal	AM	14.8	B
				PM	15.8	B
3	Hollister Street & Main Street	San Diego & Chula Vista	Signal	AM	11.6	B
				PM	19.6	B
4	Palm Avenue & I-5 SB Ramps	Caltrans	Signal	AM	39.4	D
				PM	65.3	E
5	Palm Avenue & I-5 NB Ramps	Caltrans	Signal	AM	11.2	B
				PM	10.2	B
6	Hollister Street & Palm Avenue	San Diego	Signal	AM	13.6	B
				PM	15.3	B

Notes:

**Bold** values indicate intersections operating at LOS E or F.

(a) Signal = Traffic Signal, SSSC = Side Street Stop Control,

(b) Delay refers to the average control delay for the entire intersection measured in seconds per vehicle. At SSSC intersections, delay refers to the worst movement.

(c) LOS calculations based on methodologies outlined in the 6th Edition HCM and performed using Synchro 10.

**Table 3-2** Existing Conditions Roadway Segment LOS Summary

Roadway Segment	Roadway Classification (a)	LOS E Capacity	Existing Conditions		
			ADT (b)	V/C Ratio (c)	LOS
<b>Main Street</b>					
I-5 NB Ramps to Hollister Street	4 Lane Major Arterial	40,000	26,312	0.658	C
<b>Hollister Street</b>					
Main Street to Marian Avenue	2 Lane Collector (no center lane)	8,000	6,372	0.797	D
Marian Avenue to North Project Limit	2 Lane Collector (no center lane)	8,000	6,372	0.797	D
North Project Limit to South Project Limit (Project Frontage)	2 Lane Collector (no fronting property)	10,000	6,372	0.637	C
South Project Limit to Conifer Avenue	2 Lane Collector (no fronting property)	10,000	6,372	0.637	C
Conifer Avenue to Palm Avenue	2 Lane Collector (no center lane)	8,000	6,639	0.830	<b>E</b>
<b>Palm Avenue</b>					
I-5 NB Ramps to Hollister Street	4 Lane Collector	30,000	22,262	0.742	D

Notes:

**Bold** values indicate roadway segments operating at LOS E or F.

(a) Existing road classifications are based on field work conducted in November 2018.

(b) Average Daily Traffic (ADT) volumes for the roadway segments were provided by NDS and measured on April 19, 2017.

(c) The v/c ratio is calculated by dividing the ADT volume by each respective roadway segment's capacity.

## 3.5 FREEWAY ANALYSIS

**Table 3-3** displays the LOS analysis results for the freeway under Existing Conditions. As shown in the table, all freeway facilities currently operate at LOS D or better during both peak periods. **Table 3-4** displays the 95<sup>th</sup> percentile queue lengths for the off-ramps located within the study area compared to the storage length available for each off-ramp.

**Table 3-4** displays the 95<sup>th</sup> percentile queue results for the freeway off-ramps at study area intersections under Existing Conditions. As shown in the table, all off-ramp queues do not exceed available storage during both peak periods.

**Appendix E** contains the freeway LOS and off-ramp queue calculation worksheets.

**Table 3-3** Existing Conditions Freeway LOS Summary

Freeway Facility	Facility Type	Peak Hour	Existing Conditions		
			Speed (mph) (a)	Density (pc/mi/ln) (b)	LOS (c)
<b>I-5 Northbound</b>					
Palm Ave Off-Ramp	Diverge	AM	67.3	19.7	C
		PM	68.7	16.0	C
Palm Ave to Main St	Weave	AM	60.6	18.0	B
		PM	62.7	14.8	B
Main St On-Ramp	Merge	AM	75.3	14.5	B
		PM	75.4	12.6	B
<b>I-5 Southbound</b>					
Main St Off-Ramp	Diverge	AM	75.4	8.4	A
		PM	70.2	23.8	C
Main St to Palm Ave	Weave	AM	60.5	9.7	A
		PM	51.2	32.4	D
Palm Ave On-Ramp	Merge	AM	75.2	4.5	A
		PM	74.3	17.4	B
SR75 On-Ramp	Merge	AM	70.5	5.2	A
		PM	68.7	20.2	B

Notes:

- (a) Speed is measured in miles per hour (mph).
- (b) Density is measured in passenger cars per mile per lane (pc/mi/ln)
- (c) LOS calculations based on methodologies outlined in the 6th Edition HCM and performed using HCS 7.

**Table 3-4 Existing Conditions Freeway Off-Ramp Queue Summary**

Off-Ramp Location		Traffic Control (a)	Off-Ramp Storage Lengths (ft) (b)	Peak Hour	95 <sup>th</sup> Percentile Queue Length (ft) (c)
1	I-5 SB Off-Ramp at Main Street	SSSC	1,500	AM	118
				PM	211
2	I-5 NB Off-Ramp at Main Street	Signal	1,100	AM	317
				PM	329
5	I-5 SB Off-Ramp at Palm Avenue	Signal	1,400	AM	389
				PM	750
6	I-5 NB Off-Ramp at Palm Avenue	Signal	1,100	AM	227
				PM	163

Notes:

- (a) SSSC= Side Street Stop Control, Signal = Traffic Signal.
- (b) Off-ramp storage length measured from theoretical gore point to intersection stop bar for longest lane.
- (c) 95<sup>th</sup> percentile queue lengths measured based on HCM 2010 for signalized intersections, and HCM 2000 for unsignalized intersections.

## 4 PROJECT TRAFFIC

The following section describes the trip generation, distribution and assignment related to the proposed Bella Mar project at 408 Hollister Street. The proposed project includes the construction of 380-unit multi-family residential dwelling units, including 100 affordable units, within the City of San Diego.

### 4.1 ROADWAY NETWORK CHANGES

The development of the project site will include the following improvements to provide accessible connectivity for the project site and to comply with the City of San Diego Bike Master Plan:

- Widen Hollister Street along the project frontage by 16 feet to the ultimate classification of a two-lane collector with a continuous two-way left-turn lane and buffered bike lanes.
- Relocate the southbound bus stop on Hollister Street for Bus Route 932 to be in front of the project site.
- Construct a bus stop on northbound Hollister Street for Bus Route 932 across from the project site.
- Construct a mid-block crossing across Hollister Street on the north side of the southern project driveway with a rectangular rapid flashing beacon (RRFB) system. Mid-block crossing warrant evaluation provided in **Appendix F**.
- Construct non-contiguous sidewalk facilities along the project frontage on southbound Hollister Street
- Construct non-contiguous sidewalk facilities along northbound Hollister Street from the proposed bus stop to the proposed mid-block crossing.
- Construct temporary accessible sidewalk along southbound Hollister Street between the project site and Conifer Avenue.

These improvements along the project frontage are assumed for the Opening Year with Project and Horizon Year with Project scenarios.

### 4.2 TRIP GENERATION

The City of San Diego *Trip Generation Manual* (May 2003) was referenced to calculate the estimated trip generation for the proposed project. The driveway trip generation rate of 6 trips per dwelling units for *Multiple Dwelling Unit – Over 20 dwelling units/acre* was used to estimate trips for the project. A 10% daily trip reduction and 14% AM peak hour and 14% PM peak hour was then applied to account for the project's proximity within a half mile of the Palm Avenue Transit Station and that it is anticipated transit will be heavily utilized by the project. Accessible connections to the transit station will be provided as part of the project with bus stops for Bus Route 932 in front of the project site on Hollister Street as discussed in Section 4-1.

The resulting trip generation with the trip reductions is 2,052 daily trips with 156 morning peak-hour trips (31 in, 125 out) and 176 afternoon peak-hour trips (124 in, 52 out). These values are used in the trip assignment to the roadway network. **Table 4-1** summarizes the trip generation for the site.

**Table 4-1** Trip Generation Summary

Land Use	Units <sup>1</sup>	Trip Rate <sup>2</sup>	Daily Trips	AM Peak Hour			PM Peak Hour		
				In	Out	Total	In	Out	Total
Multiple Dwelling Unit – Over 20 dwelling units/acre	380 du	6 / du	2,280	36	146	182	144	61	205
Trip Reductions for Proximity to the Palm Avenue Transit Station			-10%	-14%			-14%		
			-228	-5	-20	-25	-20	-9	-29
<b>NET TRIP GENERATION</b>			<b>2,052</b>	<b>31</b>	<b>126</b>	<b>157</b>	<b>124</b>	<b>52</b>	<b>176</b>

Notes:

1. Du = dwelling units
2. Daily and peak-hour, trip generation rates referenced are from the City of San Diego Land Development Code - Trip Generation Manual, May 2003. Transit reductions are from the draft TSM (June 2020)

## 4.3 TRIP DISTRIBUTION

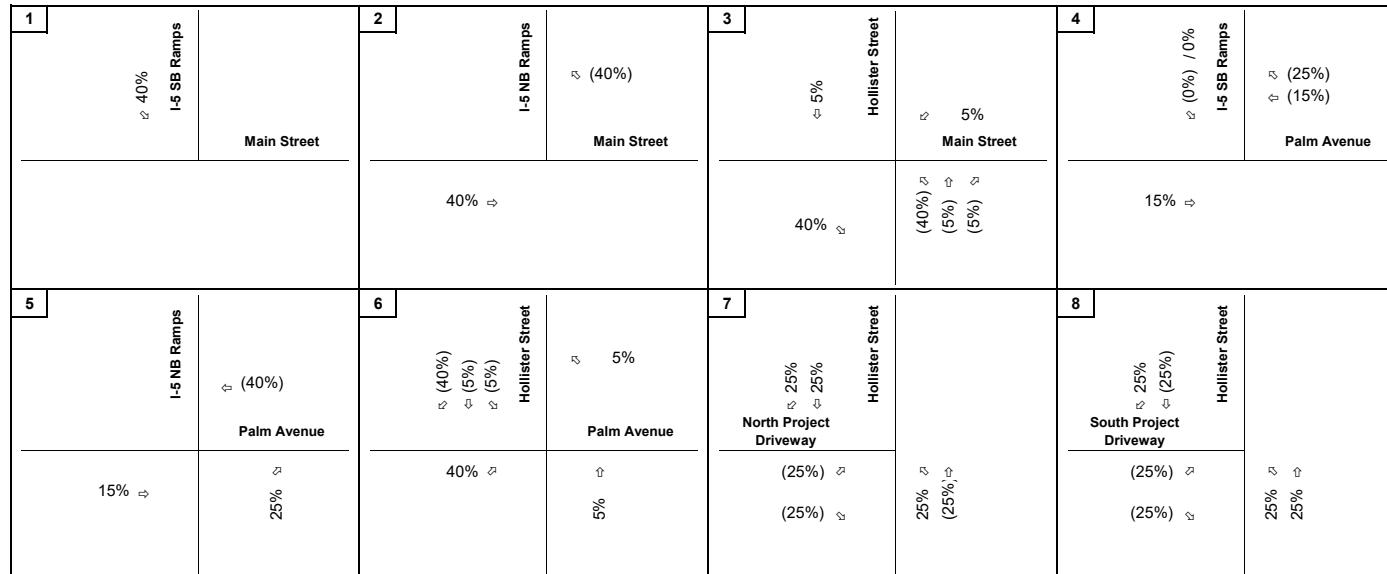

The project traffic distribution was estimated based on the project access locations, freeway access and knowledge of the existing roadway network within the study area. Although a market study was not performed for this location, it was assumed that 100% of the traffic with destinations along northbound I-5 would utilize Main Street to access the freeway, and 100% of traffic with destinations along southbound I-5 would utilize Palm Avenue to access the freeway. Based on ADT values along Hollister Street north and south of the project site and assumed employment opportunities, it was assumed that 50% of the project traffic will travel to destinations north of the site using northbound Hollister Street and 50% of traffic will have destinations south of the project using southbound Hollister Street.

**Figure 4-1** shows the general project traffic distribution within the study area and throughout the study intersections.

## 4.4 TRIP ASSIGNMENT

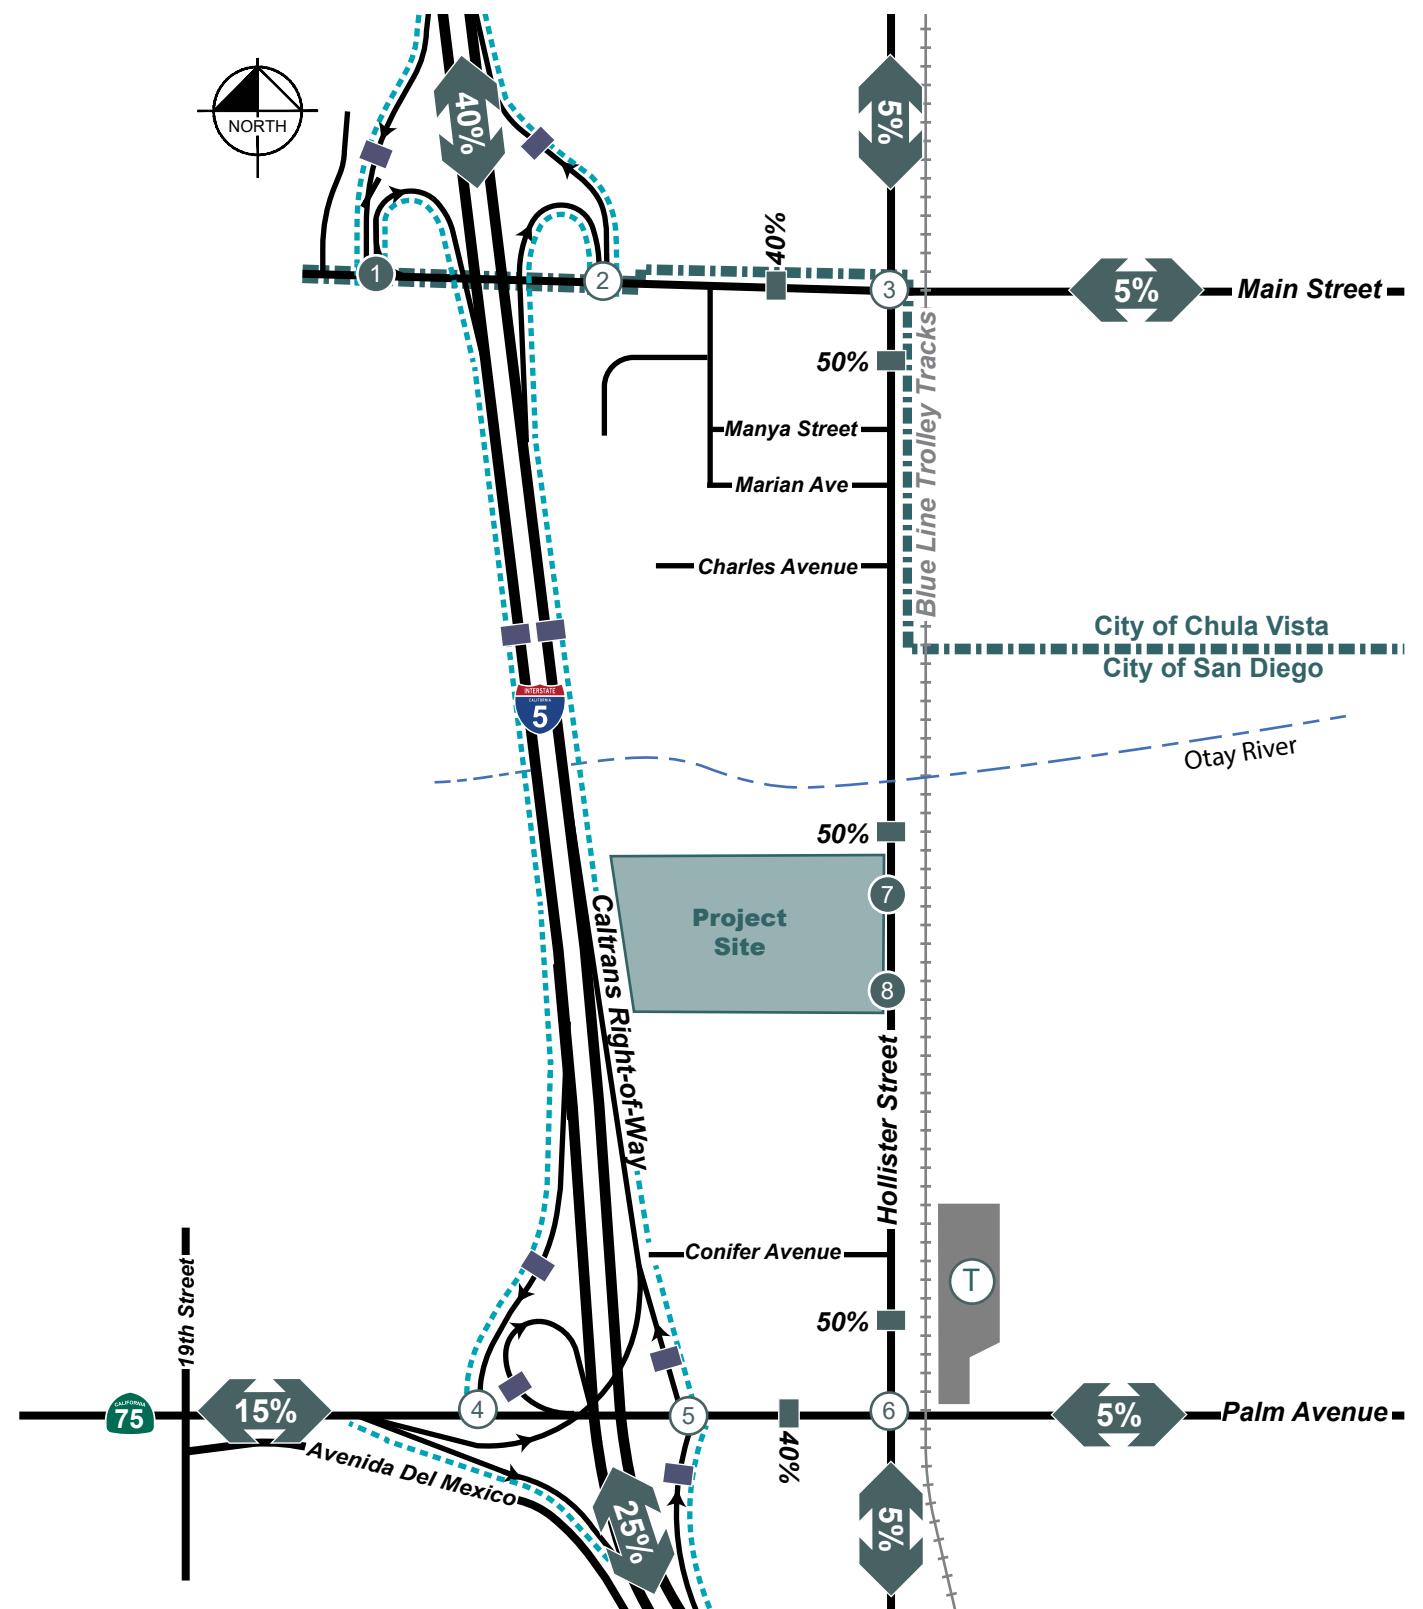

Based on the project trip generation and trip distribution, AM and PM project trips were assigned to the local roadway network and through the study intersections. **Figure 4-2** displays the trip assignment for the project at the study intersections and roadway segments within the study area.

## 5 OPENING YEAR (2021) CONDITIONS

This section summarizes the Opening Year (2021) Conditions. This scenario establishes a baseline to compare against the Opening Year (2021) with Project Conditions to determine direct project effects. Year 2021 was selected as the anticipated opening year of the project.

### 5.1 ROADWAY NETWORK CHANGES

No changes to the study roadway network are assumed to take place under Opening Year (2021) Conditions.

### 5.2 TRAFFIC VOLUMES

Opening Year volumes were forecast by applying an annual growth rate to the existing traffic volumes for 4 years to estimate Year 2021 baseline volumes. Typically, the annual growth rate for Opening Year baseline conditions are calculated using historical count data or cumulative project trips. However, as shown in **Table 5-1**, the historical traffic data yielded growth rates between -4% and 5%. Furthermore, only one cumulative project was identified to be constructed prior to Opening Year (2021), which would generate traffic on Main Street and would indicate 0% traffic growth on Hollister Street and Palm Avenue. As shown in Table 5-1 growth rates resulting from the SANDAG methodology were more reflective of typical annual growth for the region than growth rates calculated from historical traffic data or cumulative projects. Therefore, growth rates resulting from the SANDAG model were used as a conservative approach.

Volumes documented in the SANDAG Series 12 model runs for 2008 and 2050 were used to calculate the growth rate for the study area. The annual growth rate for each segment was directly applied to the roadway segments, and the intersection volumes were forecasted using the highest growth rate of all legs of the intersection. The growth rates used for each segment are summarized in **Table 5-2**.

Traffic from cumulative nearby projects throughout the community were also added to Opening Year (2021) baseline traffic. The only cumulative project identified by the City of Chula Vista and the City of San Diego to be included in the Opening Year (2021) analysis is the Otay River Business Park. The proposed Otay River Business Park is currently under construction. It is located on the southwest corner of Main Street and 4<sup>th</sup> Avenue in the City of Chula Vista. Relevant information from the Otay River Business Park Traffic Impact Analysis including the total project assignment volumes is included in **Appendix G**.

The Opening Year (2021) Cumulative Project traffic volumes are shown in **Figure 5-1**. The resulting Opening Year (2021) Traffic Volumes are shown in **Figure 5-2**.

**Table 5-1 Growth Rate Methodology Comparison**

ROADWAY SEGMENT	ROADWAY CLASSIFICATION	Project Count Apr-18	Historical Data												SANDAG Series 12 Model

### 5.3 INTERSECTION ANALYSIS

**Table 5-3** displays the LOS analysis results for the study intersections under the Opening Year (2021) Conditions. As shown in the table, all intersections within the study area would operate at LOS D or better except for the following:

- **Intersection 4** – Palm Avenue & I-5 SB Ramps (LOS E in the PM Peak)

**Appendix D-2** contains the intersection LOS calculation worksheets for the Opening Year (2021) Conditions.

**Table 5-3** Opening Year (2021) Conditions Intersection LOS Summary

Intersection		Jurisdiction	Traffic Control (a)	Peak Hour	Opening Year (2021) Conditions	
					Delay (b)	LOS (c)
1	Main Street & I-5 SB Ramps	Caltrans	SSSC	AM	17.6	C
				PM	31.0	D
2	Main Street & I-5 NB Ramps	Caltrans	Signal	AM	16.3	B
				PM	19.0	B
3	Hollister Street & Main Street	San Diego & Chula Vista	Signal	AM	12.5	B
				PM	21.2	C
4	Palm Avenue & I-5 SB Ramps	Caltrans	Signal	AM	44.0	D

## 5.4 ROADWAY SEGMENT ANALYSIS

**Table 5-4** displays the roadway segments analysis under the Opening Year (2021) Conditions. As shown in the table, all study roadway segments would operate at LOS D or better except for the following:

- **Hollister Street** – Main Street to Marian Avenue (LOS E)
- **Hollister Street** – Marian Avenue to North Project Limit (LOS E)
- **Hollister Street** – Conifer Avenue to Palm Avenue (LOS E)

**Table 5-4** Opening Year (2021) Conditions Roadway Segment LOS Summary

Roadway Segment	Roadway Classification (a)	LOS E Capacity	Opening Year (2021) Conditions		
			ADT (b)	V/C Ratio (c)	LOS
<b>Main Street</b>					
I-5 NB Ramps to Hollister Street	4 Lane Major Arterial	40,000	28,333	0.708	C
<b>Hollister Street</b>					
Main Street to Marian Avenue	2 Lane Collector (no center turn lane)	8,000	6,857	0.857	<b>E</b>
Marian Avenue to North Project Limit	2 Lane Collector (no center turn lane)	8,000	6,828	0.854	<b>E</b>
North Project Limit to South Project Limit (Project Frontage)	2 Lane Collector (no fronting property)	10,000	6,828	0.683	C
South Project Limit to Conifer Avenue	2 Lane Collector (no fronting property)	10,000	6,828	0.683	C
Conifer Street to Palm Avenue	2 Lane Collector (no center turn lane)	8,000	7,098	0.887	<b>E</b>
<b>Palm Avenue</b>					
I-5 NB Ramps to Hollister Street	4 Lane Collector	30,000	22,955	0.765	D

Notes:

**Bold** values indicate roadway segments operating at LOS E or F.

- Existing road classifications are based on field work conducted in November 2018.
- Average Daily Traffic (ADT) volumes for the roadway segments were calculated by applying an annual growth rate to the existing traffic volumes for 4 years to estimate Year 2021. The annual growth rate was calculated using volumes documented in the SANDAG Series 12 model runs for 2008 and 2050
- The v/c ratio is calculated by dividing the ADT volume by each respective roadway segment's capacity.

## 5.5 FREEWAY ANALYSIS

**Table 5-5** displays the LOS analysis results for the freeway analysis under Opening Year (2021) Conditions. As shown in the table, all freeway facilities would be expected to operate at LOS D or better during both peak periods with the exception of the I-5 Southbound weave segment between Main Street and Palm Avenue which would operate at LOS E in the PM Peak.

**Table 5-6** displays the 95<sup>th</sup> percentile queue results for the freeway off-ramps at study area intersections under Opening year (2021) Conditions. As shown in the table, all off-ramp queues would be accommodated within available storage during both peak periods.

**Appendix E** contains the freeway LOS and off-ramp queue calculation worksheets.

**Table 5-5** Opening Year (2021) Conditions Freeway LOS Summary

Freeway Facility	Facility Type	Peak Hour	Opening Year (2021) Conditions		
			Speed (mph) (a)	Density (pc/mi/ln) (b)	LOS (c)
<b>I-5 Northbound</b>					
Palm Ave Off-Ramp	Diverge	AM	67.2	21.5	D
		PM	68.6	17.4	C
Palm Ave to Main St	Weave	AM	59.0	20.2	C
		PM	61.8	16.3	B
Main St On-Ramp	Merge	AM	74.9	15.9	B
		PM	75.4	13.8	B
<b>I-5 Southbound</b>					
Main St Off-Ramp	Diverge	AM	75.4	9.7	A
		PM	67.9	26.7	D
Main St to Palm Ave	Weave	AM	60.1	10.7	B
		PM	50.0	36.1	E
Palm Ave On-Ramp	Merge	AM	75.2	5.1	A
		PM	73.2	19.5	C
SR75 On-Ramp	Merge	AM	70.5	5.9	A
		PM	68.4	22.3	C

Notes:

**Bold** values indicate roadway segments operating at LOS E or F.

(a) Speed is measured in miles per hour (mph).

(b) Density is measured in passenger cars per mile per lane (pc/mi/ln)

(c) LOS calculations based on methodologies outlined in the 6th Edition HCM and performed using HCS 7.

**Table 5-6** Opening Year (2021) Conditions Freeway Off-Ramp Queue Summary

Off-Ramp Location		Traffic Control (a)	Off-Ramp Storage Lengths (ft) (b)	Peak Hour	95 <sup>th</sup> Percentile Queue Length (ft) (c)
1	I-5 SB Off-Ramp at Main Street	SSSC	1,500	AM	183
				PM	253
2	I-5 NB Off-Ramp at Main Street	Signal	1,100	AM	369
				PM	367
5	I-5 SB Off-Ramp at Palm Avenue	Signal	1,400	AM	408
				PM	784
6	I-5 NB Off-Ramp at Palm Avenue	Signal	1,100	AM	244
				PM	173

Notes:

(a) SSSC= Side Street Stop Control, Signal = Traffic Signal.

(b) Off-ramp storage length measured from theoretical gore point to intersection stop bar for longest lane.

(c) 95<sup>th</sup> percentile queue lengths measured based on HCM 2010 for signalized intersections, and HCM 2000 for unsignalized intersections.

## 6 OPENING YEAR (2021) WITH PROJECT CONDITIONS

This section provides a description of the Opening Year (2021) Conditions with the addition of the Bella Mar project traffic, which proposes the construction of a multi-family residential development. Access to the project would be from two driveways on Hollister Street.

The proposed project would generate 2,052 daily trips with 156 morning peak-hour trips (31 in, 125 out) and 176 afternoon peak-hour trips (124 in, 52 out). Opening Year (2021) with Project Conditions volumes were determined by adding the project traffic to the Opening Year (2021) Conditions volumes and are shown in **Figure 6-1**.

### 6.1 ROADWAY NETWORK CHANGES

The proposed project will include the improvements described in Section 4.1. No other changes to the study roadway network are assumed to take place under Opening Year (2021) with Project Conditions.

### 6.2 INTERSECTION ANALYSIS

**Table 6-1** displays the LOS analysis results for the study intersections under the Opening Year (2021) with Project Conditions. As shown in the table, all intersections within the study area would operate at LOS D or better with the addition of the proposed project except for the following:

- **Intersection 1** – Main Street & I-5 SB Ramps (LOS E in the PM Peak)
- **Intersection 4** – Palm Avenue & I-5 SB Ramps (LOS E in the PM Peak)

The intersection of Main Street at I-5 Southbound Ramps is expected to operate at LOS D during the PM Peak under Opening Year (2021) Conditions and would operate at LOS E with the addition of the proposed project. This intersection is located outside of a ½ mile travel of a major transit stop and projected to degrade the intersection operations to LOS E. Therefore, a direct project effect is anticipated under Opening Year (2021) with Project Conditions.

The intersection of Palm Avenue at I-5 Southbound Ramps is expected to operate at a LOS E during the PM Peak under Opening Year (2021) Conditions and would operate at LOS E with the addition of the proposed project. The project is located within ½ mile of a major transit station and would not degrade the intersection to LOS F operations, which is not considered a direct project effect.

**Appendix D-3** contains the intersection LOS calculation worksheets for the Opening Year (2021) with Project Conditions.

### 6.3 ROADWAY SEGMENT ANALYSIS

**Table 6-2** displays the roadway segments analysis under the Opening Year (2021) with Project Conditions.

As shown in the table, all study roadway segments would operate at LOS D or better except for the following:

- **Hollister Street** – Main Street to Marian Avenue (LOS E)
- **Hollister Street** – Marian Avenue to North Project Limit (LOS E)
- **Hollister Street** – Conifer Avenue to Palm Avenue (LOS F)

This results in direct project effects to the roadway segments as a result of the proposed project under Opening Year (2021) with Project Conditions.

Notes:

**Bold** values indicate intersections operating at LOS E or F. **Bold and Shaded** values indicate a project effect.

- (a) Signal = Traffic Signal, SSSC = Side Street Stop Control, TWSC = Two-Way Stop Control
- (b) Delay refers to the average control delay for the entire intersection measured in seconds per vehicle. At SSSC and TWSC intersections, delay refers to the worst movement.
- (c) LOS calculations based on methodologies outlined in the 6th Edition HCM and performed using Synchro 10.
- (d) Project Effect?

## 6.4 FREEWAY ANALYSIS

**Table 6-3** displays the freeway analysis under the Opening Year (2021) with Project Conditions. As shown in the table the I-5 Southbound weave segment between Main Street and Palm Avenue operates at a LOS E during the PM peak period under Opening Year (2021) Conditions. The weave segment on I-5 Southbound would not be considered a project effect.

**Table 6-4** displays the 95<sup>th</sup> percentile queue results for the freeway off-ramps at study area intersections under Opening Year (2021) with Project Conditions. As shown in the table, all off-ramp queues would be accommodated within available storage.

**Appendix E** contains the freeway LOS and off-ramp queue calculation worksheets.

**Table 6-2** Opening Year (2021) with Project Conditions Roadway Segment LOS Summary

Roadway Segment	Opening Year (2021) Conditions					Opening Year (2021) with Project Conditions					$\Delta$ in V/C	Effect?

5 I-5 SB Off-Ramp at Palm Avenue	Signal	1,400	AM	408	408	
			PM	784	785	
6 I-5 NB Off-Ramp at Palm Avenue	Signal	1,100	AM	244	266	
			PM	173	187	

Notes:

(a) SSSC= Side Street Stop Control, Signal = Traffic Signal.

(b) Off-ramp storage length measured from theoretical gore point to intersection stop bar for longest lane.

(c) 95<sup>th</sup> percentile queue lengths measured based on HCM 2010 for signalized intersections, and HCM 2000 for unsignalized intersections.

## 6.5 PROJECT EFFECTS AND IMPROVEMENTS

Based on Caltrans guidelines, there would be a project effect at the following intersection under Opening Year (2021) Conditions:

- **Intersection 1: Main Street & I-5 SB Ramps – PM Peak**

As shown in the table, operations at Main Street and I-5 Southbound Ramps could be restored to better than baseline conditions by installing a traffic signal or a roundabout. However, the City of Chula Vista does not currently have a project in this location to pay a fair share contribution towards. Therefore, no improvement is required as part of this project.

**Table 6-5** Opening Year (2021) with Project Improvements Intersection LOS Summary

Intersection		Peak Hour	Opening Year (2021) with Project Conditions		Opening Year (2021) with Project Improvements Conditions		
			Delay (a)	LOS (b)	Improvement	Delay (a)	LOS (b)
1	Main Street & I-5 SB Ramps	AM	18.1	C	Signal	6.4	A
					Roundabout	6.8	A
		PM	40.9	E	Signal	7.5	A
					Roundabout	8.4	A

Notes:

**Bold** values indicate intersections operating at LOS E or F. **Bold and Shaded** values indicate a project effect.

(a) Delay refers to the average control delay for the entire intersection measured in seconds per vehicle.

(b) LOS calculations based on methodologies outlined in the 6th Edition HCM and performed using Synchro 10 for the signal and SIDRA 8 for the roundabout. See **Appendix D-3**.

Roadway project effects were caused by project traffic on various segments of Hollister Street between Main Street and Palm Avenue under Opening Year (2021) with Project Conditions. In order to improve the road network LOS a continuous two-way left turn lane is proposed along Hollister Street where feasible.

**Table 6-6** shows the proposed improvements to the surrounding area to reduce effects of the project traffic in Opening Year. **Table 6-7** shows the LOS of the road segments once improvement measures are completed. Striping concepts to demonstrate feasibility of the proposed improvements on Hollister Street are also provided in **Appendix I**.

**Table 6-6** Opening Year (2021) with Project Roadway Segment Improvements Summary

Roadway Segment	Proposed Improvement
<b>Hollister Street</b>	
Main Street to Marian Avenue	Prior to issuance of the first building permit, Owner/Permittee shall assure the re-striping of Hollister Street between Main Street and Marian Avenue to add a continuous two-way left turn lane, satisfactory to the City of Chula Vista Engineer and the City of San Diego City Engineer. All improvements must be complete and operational prior to first occupancy.
Marian Avenue to North Project Limit	No improvement – this section of roadway is currently not wide enough to re-stripe a two-way left-turn lane
Conifer Avenue to Palm Street	Prior to issuance of the first building permit, Owner/Permittee shall assure the re-striping of Hollister Street between Conifer Avenue and Palm Avenue to add a continuous two-way left turn lane, satisfactory to the City of San Diego City Engineer. All improvements must be complete and operational prior to first occupancy. Improvement will require removal of on-street parking along the east side of Hollister Street.

**Table 6-7** Opening Year (2021) with Project Improvements Roadway Segment LOS Summary

Roadway Segment	Opening Year (2021) with Project Conditions					Opening Year (2021) with Project Improvements					$\Delta$ in V/C
	Roadway Classification (a)	LOS E Capacity	ADT (b)	V/C Ratio (c)	LOS	Roadway Classification (a)	LOS E Capacity	ADT (b)	V/C Ratio (c)	LOS

I-5 NB Ramps to Hollister Street	4 Lane Collector	30,000	23,776	0.793	D	4 Lane Collector	30,000	23,776	0.793	D	0.000

Notes:

**Bold** values indicate roadway segments operating at LOS E or F.

(a) Existing road classifications are based on field work conducted in November 2018.

(b) Existing Average Daily Traffic (ADT) volumes for the roadway segments were provided by NDS and measured on April 19, 2017.

(c) The v/c Ratio is calculated by dividing the ADT volume by each respective roadway segment's capacity.

## 7 HORIZON YEAR (2050) CONDITIONS

This section provides a description of the Horizon Year (2050) Conditions. This scenario establishes a baseline to compare against the Horizon Year (2050) with Project Conditions to determine cumulative project effects. It includes a baseline scenario using model growth and a revised baseline that accounts for the Salt Bay Design District cumulative project.

### 7.1 ROADWAY NETWORK CHANGES

No changes to the study roadway network are assumed to take place under Horizon Year (2050) Conditions.

### 7.2 TRAFFIC VOLUMES

The Horizon Year daily volumes were forecasted by applying an annual growth rate to the existing traffic volumes for 33 years to estimate Year 2050. The annual growth rate was calculated using volumes documented in the SANDAG Series 12 model runs for 2008 and 2050 as seen in **Table 7-1**.

**Table 7-1** SANDAG Series 12 Model Data and Estimated Growth Rates (By Segment) for Horizon Year (2050)

Roadway Segment	2008 Model ADT	2050 Model ADT	Annual Growth Rate
<b>Main Street</b>			
I-5 NB Ramps to Hollister Street	22,700	27,100	0.4%
<b>Hollister Street</b>			
Main Street to Charles Avenue	6,200	13,400	1.9%
Charles Avenue to Conifer Avenue (Project Frontage)	5,900	12,200	1.7%
Conifer Avenue to Palm Avenue	5,600	11,300	1.7%
<b>Palm Avenue</b>			
I-5 NB Ramps to Hollister Street	22,900	31,600	0.8%

Source: SANDAG Transportation Forecast Information Center. Screenshot provided in **Appendix H**.

Horizon Year peak hour intersection volumes were factored based on the projected ADT volumes along each approach. Through movements were calculated by growing the existing traffic counts using approach growth factors calculated from the *SANDAG 2008 and 2050 Series 12* traffic models. Each respective turning movement was calculated using an iterative approach that balances the inflows and outflows for each approach.

The input values include the existing turning movement volumes and the existing and future ADT values along each leg of the intersection. The future peak hour approach volumes are then estimated by applying the existing peak-hour factor (K-factor) and directional distributional percentage (D-factor) to the future ADT volumes along each approach. A more detailed description of the methodology used to forecast turning movement volumes is contained in NCHRP 255 Highway Traffic Data for Urbanized Area Project Planning and Design, Chapter 8. An Excel model computes the forecast turning volumes from existing turning movement volumes and ADT volumes by the techniques described in NCHRP 255.

**Appendix J** contains the future intersection volume information and calculations.

**Figure 7-1** illustrates the resulting Horizon Year (2050) Baseline Conditions peak-hour and daily traffic volumes in the study area.

Traffic from a cumulative nearby project, the Salt Bay Design District was also added to Horizon Year (2050) baseline volume, as the project is not anticipated to be constructed until after Opening Year (2021) and was not accounted for in the SANDAG community buildout traffic model. The proposed Salt Bay Design District is located on Bay Boulevard partially in the City of Chula Vista and partially in the City of San Diego approximately 1.5 miles from the project site. Relevant information from the Salt Bay Design District Draft Traffic Impact Analysis including the total project assignment volumes is included in **Appendix K**.

The Horizon Year (2050) Cumulative Project traffic volumes are shown in **Figure 7-2**. The resulting Horizon Year (2050) with Cumulative Project Condition traffic volumes are shown in **Figure 7-3**. The revised baseline volumes shown in Figure 7-3 that account for the Salt Bay Design District cumulative project are used as the baseline comparison for plus project analyses.

### 7.3 INTERSECTION ANALYSIS

**Table 7-2** displays the LOS analysis results for the study intersections under the Horizon Year (2050) Conditions and the Horizon Year (2050) with Cumulative Project Conditions. As shown in the table, the following intersections within the study area would operate at LOS E or F after factoring in the Salt Bay Design District cumulative project traffic volumes:

- **Intersection 1** – Main Street & I-5 SB Ramps (LOS F in both peaks)
- **Intersection 2** – Main Street & I-5 NB Ramps (LOS E in the PM peak)
- **Intersection 4** – Palm Avenue & I-5 SB Ramps (LOS F in both peaks)

**Appendix D-4** contains the intersection LOS calculation worksheets for Horizon Year (2050) Conditions. **Appendix D-5** contains the intersection LOS calculation worksheets for Horizon Year (2050) with Cumulative Project Conditions.

**Table 7-2** Horizon Year (2050) Conditions Intersection LOS Summary

Intersection		Jurisdiction	Traffic Control (a)	Peak Hour	Horizon Year (2050) Baseline Conditions		Horizon Year (2050) with Cumulative Project Conditions	
					Delay (b)	LOS (c)	Delay (b)	LOS (c)
1	Main Street & I-5 SB Ramps	Caltrans	SSSC	AM	18.8	C	251.0	<b>F</b>
				PM	72.4	<b>F</b>	**	<b>F</b>
2	Main Street & I-5 NB Ramps	Caltrans	Signal	AM	20.1	C	31.8	C
				PM	26.2	C	75.3	<b>E</b>
3	Hollister Street & Main Street	San Diego & Chula Vista	Signal	AM	17.0	B	19.6	B
				PM	44.9	D	45.5	D

## 7.4 ROADWAY SEGMENT ANALYSIS

**Table 7-3** displays the roadway segments analysis under the Horizon Year (2050) Baseline Conditions and the Horizon Year (2050) with Cumulative Project Conditions. As shown in the table, the following roadway segments would operate at unacceptable LOS under Horizon Year (2050) Conditions:

- **Hollister Street** – Main Street to Marian Avenue (LOS F)
- **Hollister Street** – Marian Avenue to North Project Limit (LOS F)
- **Hollister Street** – North Project Limit to South Project Limit (LOS F)
- **Hollister Street** – South Project Limit to Conifer Avenue (LOS F)
- **Hollister Street** – Conifer Avenue to Palm Avenue (LOS F)
- **Palm Avenue** – I-5 NB Ramps to Hollister Street (LOS E)

**Table 7-3** Horizon Year (2050) Conditions Roadway Segment LOS Summary

Roadway Segment	Roadway Classification (a)	LOS E Capacity	Horizon Year (2050) Baseline Conditions			Horizon Year (2050) with Cumulative Project Conditions		
			ADT (b)	V/C Ratio (c)	LOS	ADT (b)	V/C Ratio (c)	LOS
<b>Main Street</b>								
I-5 NB Ramps to Hollister Street	4 Lane Major Arterial	40,000	31,815	0.795	D	33,345	0.834	D
<b>Hollister Street</b>								
Main Street to Marian Avenue	2 Lane Collector (no center turn lane)	8,000	11,675	1.459	F	11,675	1.459	F
Marian Avenue to North Project Limit	2 Lane Collector (no center turn lane)	8,000	11,277	1.410	F	11,277	1.410	F
North Project Limit to South Project Limit (Project Frontage)	2 Lane Collector (no fronting property)	10,000	11,277	1.128	F	11,277	1.128	F
South Project Limit to Conifer Avenue	2 Lane Collector (no fronting property)	10,000	11,277	1.128	F	11,277	1.128	F
Project Site to Palm Avenue	2 Lane Collector (no center turn lane)	8,000	11,525	1.441	F	11,525	1.441	F
<b>Palm Avenue</b>								
I-5 NB Ramps to Hollister Street	4 Lane Collector	30,000	28,671	0.956	E	28,671	0.956	E

Notes:

**Bold** values indicate roadway segments operating at LOS E or F.

- Existing road classifications are based on field work conducted in November 2018.
- Average Daily Traffic (ADT) volumes for the roadway segments were calculated by applying an annual growth rate to the existing traffic volumes for 33 years to estimate Year 2050. The annual growth rate was calculated using volumes documented in the SANDAG Series 12 model runs for 2008 and 2050.
- The v/c ratio is calculated by dividing the ADT volume by each respective roadway segment's capacity.

## 7.5 FREEWAY ANALYSIS

**Table 7-4** displays the LOS analysis results for the freeway analysis under Horizon Year (2050) Conditions and the Horizon Year (2050) with Cumulative Project Conditions. As shown in the table, all freeway facilities would operate at LOS D or better during both peak periods except for the following:

- **I-5 Northbound** – Palm Avenue Off-Ramp (LOS E in the AM Peak)
- **I-5 Southbound** – Main Street Off-Ramp (LOS F in the PM Peak)
- **I-5 Southbound** – Weave Segment between Main Street and Palm Avenue (LOS F in the PM Peak)

Table 7-5 displays the 95<sup>th</sup> percentile queue results for the freeway off-ramps at study area intersections under Horizon Year (2050) with Project Conditions and the Horizon Year (2050) with Cumulative Project Conditions. As shown in the table, the following off ramp has an error in the queue report, indicating the queues exceed capacity of the off-ramp:

- **I-5 Southbound at Main Street**

**Appendix E** contains the freeway LOS and off-ramp queue calculation worksheets.

**Table 7-4** Horizon Year (2050) Conditions Freeway LOS Summary

Freeway Facility	Facility Type	Peak Hour	Horizon Year (2050) Conditions			Horizon Year (2050) with Cumulative Project Conditions		
			Speed (mph) (a)	Density (pc/mi/ln) (b)	LOS (c)	Speed (mph) (a)	Density (pc/mi/ln) (b)	LOS (c)
<b>I-5 Northbound</b>

		PM	22.8	76.7	<b>F</b>	23.6	75.7	<b>F</b>
Main St to Palm Ave	Weave	AM	58.1	12.7	B	58.1	12.7	B
		PM	53.3	30.6	<b>F</b>	53.3	30.6	<b>F</b>
Palm Ave On-Ramp	Merge	AM	75.2	5.7	A	75.2	5.7	A
		PM	69.5	16.7	B	69.5	16.7	B
SR75 On-Ramp	Merge	AM	70.5	6.6	A	70.5	6.6	A
		PM	68.9	17.4	B	68.9	17.4	B

Notes:

**Bold** values indicate roadway segments operating at LOS E or F.

(a) Speed is measured in miles per hour (mph).

(b) Density is measured in passenger cars per mile per lane (pc/mi/ln).

(c) LOS calculations based on methodologies outlined in the 6th Edition HCM and performed using HCS 7.

**Table 7-5** Horizon Year (2050) Conditions Freeway Off-Ramp Queue Summary

Off-Ramp Location		Traffic Control (a)	Off-Ramp Storage Lengths (ft) (b)	Peak Hour	95 <sup>th</sup> Percentile Queue Length (ft) (c)	
					Horizon Year (2050) Baseline Conditions	Horizon Year (2050) With Cumulative Project Conditions
1	I-5 SB Off-Ramp at Main Street	SSSC	1,500	AM	207	Error (d)
				PM	473	Error (d)
2	I-5 NB Off-Ramp at Main Street	Signal	1,100	AM	462	520
				PM	545	609
5	I-5 SB Off-Ramp at Palm Avenue	Signal	1,400	AM	643	643
				PM	1,001	1,001
6	I-5 NB Off-Ramp at Palm Avenue	Signal	1,100	AM	657	657
				PM	320	320

Notes:

- (a) SSSC= Side Street Stop Control, Signal = Traffic Signal.
- (b) Off-ramp storage length measured from theoretical gore point to intersection stop bar for longest lane.
- (c) 95<sup>th</sup> percentile queue lengths measured based on HCM 2010 for signalized intersections, and HCM 2000 for unsignalized intersections.
- (d) Error indicates the capacity of the intersection approach is exceeded by a number that cannot be defined.

## 8 HORIZON YEAR (2050) WITH PROJECT CONDITIONS

This section provides a description of the Horizon Year (2050) Conditions with the addition of the Bella Mar project traffic, which proposes the construction of a multi-family residential development. Results of the Horizon Year (2050) with Project Conditions are compared to the Horizon Year (2050) with Cumulative Project Conditions in this section. Access to the project would be from two driveways on Hollister Street.

### 8.1 ROADWAY NETWORK CHANGES

The proposed project will include the improvements described in Section 4.1. No other changes to the study roadway network are assumed to take place under Horizon Year (2050) with Project Conditions.

### 8.2 TRAFFIC VOLUMES

The proposed project would generate 2,052 daily trips with 156 morning peak hour trips (31 in, 125 out) and 176 afternoon peak-hour trips (124 in, 52 out). Horizon Year (2050) with Project Conditions volumes were determined by adding the project traffic to the Horizon Year (2050) with Cumulative Project Conditions volumes and are shown in **Figure 8-1**.

### 8.3 INTERSECTION ANALYSIS

**Table 8-1** displays the LOS analysis results for the study intersections under the Horizon Year (2050) with Project Conditions. As shown in the table, the following intersections would operate at unacceptable LOS under Horizon Year (2050) Conditions:

- **Intersection 1** – Main Street & I-5 SB Ramps (LOS F in both peaks)
- **Intersection 2** – Main Street & I-5 NB Ramps (LOS E in the PM peak)
- **Intersection 4** – Palm Avenue & I-5 SB Ramps (LOS F in both peaks)

The intersection of Main Street at I-5 Southbound Ramps is expected to operate at a LOS F during the PM Peak, due to the demand of the southbound left-turn movement with the addition of the proposed project. This intersection would be considered a cumulative project effect under Horizon Year (2050) with Project Conditions. This intersection is located outside of a ½ mile travel of a major transit stop and projected to add traffic to an intersection that is already operating at LOS F. Therefore, a cumulative project effect is anticipated under Horizon Year (2050) with Project Conditions.

The intersection of Palm Avenue at I-5 Southbound Ramps is expected to operate at a LOS F during the both peak periods under Horizon Year Conditions and would continue to operate at LOS F with the addition of the proposed project. The project is located within ½ mile of a major transit station, and would add traffic to an intersection that is already operating at LOS F. Therefore, a cumulative project effect is anticipated under Horizon Year (2050) with Project Conditions.

**Appendix D-6** contains the intersection LOS calculation worksheets for the Horizon Year (2050) with Project Conditions.

Notes:

**Bold** values indicate intersections operating at LOS E or F. **Bold and Shaded** values indicate a project effect.

\*\* Delay is beyond calculable values.

(a) Signal = Traffic Signal, SSSC = Side Street Stop Control

(b) Delay refers to the average control delay for the entire intersection measured in seconds per vehicle. At SSSC intersections, delay

(c) LOS calculations based on methodologies outlined in the 6th Edition HCM and performed using Synchro 10.

(d) Project Effect?

## 8.4 ROADWAY SEGMENT ANALYSIS

**Table 8-2** displays the roadway segments analysis under the Horizon Year (2050) with Project Conditions. As shown in the table, the following roadway segments would operate at unacceptable LOS under Horizon Year (2050) with Project Conditions:

- **Hollister Street** – Main Street to Marian Avenue: LOS F
- **Hollister Street** – Marian Avenue to North Project Limit: LOS F
- **Hollister Street** – South Project Limit to Conifer Avenue: LOS F
- **Hollister Street** – Conifer Avenue to Palm Avenue: LOS F
- **Palm Avenue** – I-5 NB Ramps to Hollister Street: LOS E

This results in cumulative project effects to the Hollister Street roadway segments and Palm Avenue segment as a result of the proposed project under Horizon Year (2050) with Project Conditions.

**Table 8-2** Horizon Year (2050) with Project Conditions Roadway Segment LOS Summary

Roadway Segment	Horizon Year (2050) with Cumulative Project Conditions						Horizon Year (2050) with Project Conditions						
	Roadway Classification (a)	LOS E Capacity	ADT	V/C Ratio (b)	LOS	LOS	Roadway Classification (a)	LOS E Capacity	ADT	V/C Ratio (b)	LOS	Δ in V/C	Effect?

Conifer Avenue to Palm Avenue	2 Lane Collector (no center lane)	8,000	11,525	1.441	F	YES	2 Lane Collector (no center lane)	8,000	12,551	1.569	F	0.128	YES
<b>Palm Avenue</b>													
I-5 NB Ramps to Hollister Street	4 Lane Collector	30,000	28,671	0.956	E	YES	4 Lane Collector	30,000	29,492	0.983	E	0.027	YES

Notes:

**Bold** values indicate roadway segments operating at LOS E or F. **Bold** and Shaded values indicate a project effect.

(a) Existing road classifications are based on field work conducted in November 2018.

(b) The v/c Ratio is calculated by dividing the ADT volume by each respective roadway segment's capacity.

## 8.5 FREEWAY ANALYSIS

**Table 8-3** displays the freeway analysis under the Horizon Year (2050) with Project Conditions. As shown in the table, the following freeway segments do not operate at LOS D or better during one or both peak periods:

- **I-5 Northbound** – Palm Avenue Off-Ramp (LOS E in the AM Peak)
- **I-5 Southbound** – Main Street Off-Ramp (LOS F in the PM Peak)
- **I-5 Southbound** – Weave segment between Main Street and Palm Avenue (LOS F in the PM Peak)

The change in density on these I-5 Southbound diverge and weave points would not be considered project effects.

Table 8-4 displays the 95<sup>th</sup> percentile queue results for the freeway off-ramps at study area intersections under Horizon Year (2050) with Project Conditions. As shown in the table, the following off ramp has an error in the queue report, indicating the queues exceed capacity of the off-ramp:

- **I-5 Southbound at Main Street**

**Appendix E** contains the freeway LOS and off-ramp queue calculation worksheets.

**Table 8-3** Horizon Year (2050) with Project Conditions Freeway LOS Summary

Freeway Facility	Facility Type	Peak Hour	Horizon Year (2050) with Cumulative Project Conditions			Horizon Year (2050) with Project Conditions				
			Speed (mph) (a)	Density (pc/mi/ln) (b)	LOS (c)	Speed (mph) (a)	Density (pc/mi/ln) (b)	LOS (c)	Δ in density (pc/mi/ln) (d)	Effect?

		PM	68.9	17.4	B	68.9	17.4	B	0.0	NO

Notes:

**Bold** values indicate roadway segments operating at LOS E or F.

(a) Speed is measured in miles per hour (mph).

(b) Density is measured in passenger cars per mile per lane (pc/mi/ln).

(c) LOS calculations based on methodologies outlined in the 6th Edition HCM and performed using HCS 7.

(d) HCM models may under-predict the extent of congestion in oversaturated conditions.

**Table 8-4 Horizon Year (2050) with Project Conditions Freeway Off-Ramp Queue Summary**

Off-Ramp Location	Traffic Control (a)	Off-Ramp Storage Lengths (ft) (b)	Peak Hour	95 <sup>th</sup> Percentile Queue Length (ft) (c)	
				Horizon Year (2050) With Cumulative Project Conditions	Horizon Year (2050) with Project Conditions
1 I-5 SB Off-Ramp at Main Street	SSSC	1,500	AM	Error	Error
			PM	Error	Error
2 I-5 NB Off-Ramp at Main Street	Signal	1,100	AM	520	520
			PM	609	609
5 I-5 SB Off-Ramp at Palm Avenue	Signal	1,400	AM	643	647
			PM	1,001	1,001
6 I-5 NB Off-Ramp at Palm Avenue	Signal	1,100	AM	657	657
			PM	320	400

Notes:

- (a) SSSC= Side Street Stop Control, Signal = Traffic Signal.
- (b) Off-ramp storage length measured from theoretical gore point to intersection stop bar for longest lane.
- (c) 95<sup>th</sup> percentile queue lengths measured based on HCM 2010 for signalized intersections, and HCM 2000 for unsignalized intersections.

## 8.6 PROJECT EFFECTS AND IMPROVEMENTS

There would be a cumulative project effect at the following intersections under Horizon Year (2050) Plus Project Conditions:

- **Intersection 1: Main Street & I-5 SB Ramps** – Both Peaks
- **Intersection 2: Main Street & I-5 NB Ramps** – PM Peak
- **Intersection 4: Palm Avenue & I-5 S Ramps** – Both peaks

When comparing the Horizon Year (2050) with Project Conditions to the Horizon Year (2050) with Cumulative Project Conditions, the Bella Mar project does not significantly increase the delay at these intersections. Specifically, the project will add less than 1 second of delay to each of the intersections listed above.

The queuing issue at the I-5 southbound off-ramp at Main Street intersection is a result of large growth of volumes associated with cumulative projects and the operational deficiency identified in the intersection analysis. The proposed project contributes a small portion of volumes to this ramp in comparison to the overall growth and would not independently create queues beyond the ramps. Queues could be improved with construction of a signal or roundabout, similar to operational improvements identified. However, the City of San Diego and City of Chula Vista do not currently have a project at this location for the developer to pay a fair share contribution towards. Therefore, no improvement is required as part of this project.

Cumulative project effects on roadway segments were caused by project traffic on the following roadway segments:

- **Hollister Street** – South Project Limit to Conifer Avenue: LOS F
- **Palm Avenue** – I-5 NB Ramps to Hollister Street: LOS E

Cumulative project effects were caused by project traffic on Hollister Street from the south project limit to Conifer Avenue and on Palm Avenue between I-5 NB ramps and Hollister Street in the Horizon Year (2050) with Project Conditions. Reason for not providing project improvements to reduce effects of the project traffic at these locations are shown in **Table 8-5**.

Palm Avenue currently operates as a 4-lane collector. Providing a raised median in place of a two-way left-turn lane would modify the classification to a 4-lane major arterial according to the City of San Diego Street Design Manual, therefore increasing the capacity of this segment of the roadway to its ultimate classification. However, the City of San Diego does not currently have a project on Palm Avenue for the developer to pay a fair share contribution towards. Therefore, no improvement is required as part of this project.

**Table 8-5** Horizon Year (2050) with Project Roadway Segment Improvements Summary

Roadway Segment	Proposed Improvement
<b>Hollister Street</b>	
South Project Limit to Conifer Avenue	No improvement – this section of roadway is currently not wide enough to re-stripe a two-way left-turn lane
<b>Palm Avenue</b>	
I-5 NB Ramps to Hollister Street	No improvement – the City of San Diego does not currently have a project on Palm Avenue for the developer to pay a fair share contribution towards

## 9 PARKING

Based on the City of San Diego Municipal Code the proposed project is within a Transit Area Overlay Zone and a 2035 Transit Priority Area. However, the project is located in a coastal overlay zone, meaning the parking standards for a transit priority area do not apply. Table 143-07D of the City's Municipal Code provides parking reductions for proximity to transit. The project will provide at least 11% of very low-income housing units and is therefore subject to 0.5 parking spaces per bedroom.

**Table 9-1** displays the parking factors assumed (based on 0.5 parking spaces per bedroom rate), the minimum required parking totals, and the provided parking totals. Parking will not be allowed on Hollister Street. Therefore, additional parking beyond code requirements are provided on-site to prevent any potential spillover to nearby streets. A minimum of 360 parking spaces is required for the project, and 437 spaces are being provided.

Within Parcel 1, there will be 280 market rate units, which requires 271 parking spaces. The proposed site plan allocates 316 parking spaces in the following manner:

- 74 units will have an individual garage unit and a tandem space in front of the garage
- 105 units will have an individual garage unit
- 137 parking spaces will be provided in surface parking lots located within Parcel 1. These spaces will be allocated by the property manager for required parking, guest parking, employee parking, and deliveries.

Within Parcel 2, there will be 100 affordable units with a parking requirement of 89 spaces. A total of 121 spaces will be provided in surface parking lots located in Parcel 2. The property manager will allocate this parking to residents, guests, employees and deliveries.

Per the City's Municipal Code, bicycle parking is not required for residential development with individual garages, which accounts for 179 of the units. However, short-term bike parking (bike racks) are required and will be provided on-site. Within Parcel 1, 106 units will not have garages for long-term bike parking, and bike racks will be provided that will allow space for 44 bicycles to park. Within Parcel 2, all 100 units will not have garages for long-term bike parking. bike racks will be provided to allow space for 48 bicycles.

A total of 39 motorcycle spaces will be provided on-site (29 motorcycle spaces in Parcel 1 and 10 motorcycle spaces in Parcel 2) which meets the minimum required number of motorcycle spaces for the proposed development.

**Table 9-1** Project Parking Summary

PARCEL 1 (MARKET-RATE)										
		AUTOMOBILE SPACES			MOTORCYCLE SPACES			BICYCLE SPACES (Short-Term)		
TYPE	DU	Spaces per Unit <sup>a</sup>	R	P	Spaces per Unit	R	P	Spaces per Unit	R <sup>b</sup>	P
Studio (>400SF)	0	0.5	-		0.1	-		0	-

3 Bedroom	66	1.5	99		0.1	7		0.6	0	
Total	271	316	Total	29	29	Total	46	44		
PARCEL 2 (AFFORDABLE)										
		AUTOMOBILE SPACES			MOTORCYCLE SPACES			BICYCLE SPACES (Short-Term)		
TYPE	DU	Spaces per Unit <sup>a</sup>	R	P	Spaces per Unit	R	P	Spaces per Unit	R	P
Studio (>400SF)	0	0.5	-		0.1	-		0	-	
1 Bedroom	48	0.5	24		0.1	5		-	19	
2 Bedroom	26	1.0	26		0.1	3		-	13	
3 Bedroom	26	1.5	39		0.1	3		-	16	
Total	89	121	Total	10	10	Total	48	48		

PARKING SUMMARY										
		AUTOMOBILE SPACES			MOTORCYCLE SPACES			BICYCLE SPACES (Short-Term)		
TYPE	UNIT	Spaces per Unit <sup>a</sup>	R	P	Spaces per Unit	R	P	Spaces per Unit	R	P
Parcel 1	280 DU market rate	-	271	316	-	29	29	-	46	44
Parcel 2	100 DU affordable	-	89	121	-	10	10	-	48	48
Total		360	437		Total	39	39	Total	94	92
OTHER AUTOMOBILE PARKING REQUIREMENTS										
TYPE		FACTOR						R	P	
Accessible Spaces		2%						12	12	

Notes: R = Minimum Required; P = Provided

<sup>a</sup> Parking spaces per unit rates based on Table 143-07D of the San Diego Municipal Code

<sup>b</sup> Bicycle parking is not required for dwelling units with garage accessible only by the residents of the dwelling unit.

The required number of bicycle parking spaces is based on the number of units without private garage access. There are 68 1-bedroom units, and 38 2-bedroom units without private garage access.

## 10 ADDITIONAL TOPICS

This section discusses pedestrian, bicycle, and transit access to the project and project improvements to these modes.

### 10.1 SITE ACCESS AND ON-SITE CIRCULATION

Access for the proposed project site is provided via two driveways on Hollister Street. Both driveways would provide full access. The project is adding a continuous two-way left-turn lane along the project frontage to provide additional capacity and a refuge area for vehicles entering the site.

Intersection analyses performed in the study show minimal expected delays at the driveways. Queuing is not anticipated to be an issue turning into the site due to the continuous turn lane being installed by the project, and the relatively low turning movement volumes into the site. The left turn pocket for the south entrance will be 50' long to provide queueing for at least two vehicles at a time. This is based on the project trips anticipated for this movement: 8 vehicles during the AM peak and 31 vehicles during the PM peak.

### 10.2 PEDESTRIAN FACILITIES

Connections to the north and south of the project site are currently limited by lack of pedestrian infrastructure. The Palm Avenue Transit Station is to the south of the project and on the opposite side of the roadway. There is a walkable dirt shoulder and intermittent sidewalk provided on the west side of Hollister Avenue (same side as the project) between the project site and the traffic signal with crossing at Palm Avenue. These facilities do not meet accessibility requirements. There is also a trail system to the north of the project but walking there from the project site requires either walking in a travel lane or a gravel path.

Project improvements for pedestrians include:

- Accessible routes from the residential units to the street are established within the proposed site plan.
- Non-contiguous sidewalk will be constructed along the west side of Hollister Street along the property frontage.
- Temporary accessible sidewalk will be constructed along the west side of Hollister Street between the property frontage and Conifer Avenue.
- A mid-block crossing across Hollister Street on the north side of the southern project driveway will be constructed. Mid-block crossing warrant evaluation provided in **Appendix F**.
- Non-contiguous sidewalk will be constructed along the east side of Hollister Street between the proposed northbound bus stop and the proposed mid-block crossing.
- Decomposed gravel path will be provided on the east side of Hollister Street between the proposed mid-block crossing and the Otay Valley Regional Trail system connection per agreement with the City of San Diego Parks and Recreation Department.

A mid-block crossing warrant analysis was performed for this location based on the 2015 *City of San Diego Pedestrian Crosswalk Guidelines* and the summary is provided in **Appendix F**.

The proposed site meets the basic warrants and the minimum number of points required for the points warrants. Based on Table 2-3 of the guidelines, the location required Category C crossing treatments. As such, the project proposes narrow lanes (11' wide) and rectangular rapid flashing beacons (RRFBs) for this mid-block crossing.

Collision data along Hollister Street was obtained near the existing mid-block crossing north of the Otay

River bridge, indicating no pedestrian-related collisions have occurred at the mid-block crossing since it was installed in 2010, and upgraded to a high-visibility crosswalk in 2018. One pedestrian-related collision occurred in the last five years on the Hollister Street bridge where there is no sidewalk.

## 10.3 BICYCLE FACILITIES

Bicycle facilities do not currently exist on any of the roadways within the project study area including Hollister Street, Palm Avenue, and Main Street.

Hollister Avenue is proposed to have Class II Bicycle Lanes based on the City of San Diego Bicycle Master Plan. The project would construct its project frontage to include buffered bike lanes in both directions. North and south of the site, the bicycle connections from the site are limited to sharing space with the vehicle travel lanes due to roadway width constraints until the remainder of the proposed bicycle lanes on Hollister Avenue are completed.

## 10.4 TRANSIT

The project site is currently served by Metropolitan Transit Service (MTS) Bus Route 932 and is located within 1,500 feet of the Palm Avenue Trolley Station.

Route 932 provides connections between the 8<sup>th</sup> Street Transit Center in National City, E Street Transit Center in Chula Vista, Palm Avenue Trolley Station and Iris Avenue Transit Center in San Diego. Route 932 provides primarily 10-15 minute headways during the weekdays between 6:00 am and 7:00 pm, with service hourly otherwise. It also operates on Saturdays and Sundays with 30-60 minute headways.

The Palm Avenue Trolley Station provides connections with Route 933, 934, and the Blue Line trolley. The trolley runs every 15 minutes from 5:00 a.m. to 2 a.m. weekdays and weekends. The project's proximity to this station allows for more regional access via transit for the future residents. **Appendix L** contains a copy of the current schedules for MTS Route 932 and documentation of planned improvements.

There is an existing bus stop for northbound service on the Route 932 line at the northeast corner of Palm Avenue and Hollister Avenue. Access to this bus stop requires crossing at the traffic signal of Palm Avenue and Hollister Avenue and walking along dirt shoulder on the west side of Hollister Avenue until reaching the project frontage that will include sidewalk.

There is an existing bus stop for southbound service on the Route 932 line at the northwest corner of Hollister Avenue and Conifer Street, approximately 800 feet south from the proposed project. That stop has a bench and sign but does not provide sidewalk or other features. Per agreement with MTS the project would relocate the southbound bus stop to be in front of project site as part of the frontage improvements.

The project improvements include:

- Installing a northbound bus stop on Hollister Street across from the project site
- Relocating the southbound bus stop on Hollister Street from the northwest corner of Hollister Street and Conifer Avenue to be in front of the project site

The bus stops would provide an accessible connection for residents to the Palm Avenue Trolley Station. For both bus stops on northbound and southbound Hollister Street, MTS would provide the necessary amenities such as a bus shelter and bench according to the anticipated number of riders per day.

Currently, access to the trolley station from the project site requires walking along dirt shoulder on the west side of Hollister Avenue and crossing at the traffic signal of Palm Avenue. As previously mentioned, the project improvements include non-contiguous sidewalk along the project frontage, and temporary accessible sidewalk connection from the project to Conifer Avenue. A mid-block crossing is also proposed at the southern driveway for access to the project site from the proposed northbound bus stop. The project improvements will provide mobility options for residents accessing the Palm Avenue Trolley Station.

## 11 FINDINGS & CONCLUSIONS

The following section provides a summary of the key findings and study recommendations and includes a summary table that compares the results from the different scenarios.

### 11.1 SUMMARY OF INTERSECTION ANALYSES

**Table 11-1** displays the intersection delay and LOS at all the study intersections for the different scenarios analyzed. As shown in the table, all intersections would operate at LOS D or better for the different scenarios except for the following:

- **Intersection 1** – Main Street & I-5 Southbound Ramps (Opening Year 2021 direct project effect)
- **Intersection 2** – Main Street & I-5 Northbound Ramps (Horizon Year 2050 project effect)
- **Intersection 4** – Palm Avenue & I-5 Southbound Ramps (Horizon Year 2050 project effect)

The City of San Diego and the City of Chula Vista do not currently have projects identified at any of these locations for the developer to pay a fair share contribution towards. Therefore, no improvement is required as part of this project.

### 11.2 SUMMARY OF ROADWAY SEGMENT ANALYSES

**Table 11-2** displays the daily traffic volumes and LOS at all the study roadway segments for the different scenarios analyzed. As part of the proposed project Hollister Street will be widened along the project frontage to provide a continuous left turn lane.

The following roadway segments are considered to have project effects with the addition of project traffic:

- **Hollister Street** between Main Street and Marian Avenue (Opening Year Plus Project direct project effect)
- **Hollister Street** between Marian Avenue and the North Project Limit (Opening Year Plus Project direct project effect)
- **Hollister Street** between the South Project Limit and Conifer Avenue (Horizon Year Plus Project Cumulative project effect)
- **Hollister Street** between Conifer Avenue and Palm Avenue (Opening Year Plus Project direct project effect)
- **Palm Avenue** between I-5 NB Ramps and Hollister Street (Horizon Year Plus Project Cumulative project effect)

**Table 11-3** summarizes the proposed improvements to the surrounding area to reduce effects of the project traffic.

Table 11-1 Summary of Intersection Level of Service Analysis

Intersection	Jurisdiction	Traffic Control (a)	Peak Hour	Existing Conditions		Opening Year (2021) Conditions		Opening Year (2021) with Project				Horizon Year (2050) Baseline Conditions		Horizon Year (2050) with Cumulative Project Conditions		Horizon Year (2050) with Project Conditions

Notes:

**Bold** values indicate roadway segments operating at LOS E or F. **Bold and Shaded** values indicate a project effect.

- (a) Existing road classifications are based on field work conducted in November 2018.
- (b) Average Daily Traffic (ADT) volumes for the roadway segments were provided by NDS and measured on April 19, 2017.
- (c) The v/c ratio is calculated by dividing the ADT volume by each respective roadway segment's capacity.
- (d) Roadway Classification the same as Without Project Conditions
- (e) Average Daily Traffic (ADT) volumes for the roadway segments were calculated by applying a growth rates derived from the SANDAG Series 12 Model to the existing volumes. Growth rates can be found in Table 5-2 of this report.
- (f) Roadway Classification the same as With Project Conditions
- (g) Average Daily Traffic (ADT) volumes for roadway segments were calculated by adding a horizon year cumulative project traffic volumes (provided in Appendix K) to the Horizon Year (2050) Baseline Conditions volumes.

**Table 11-3** Project Improvements for Roadway Segments

Roadway Segment	Project Effect	Proposed Improvement
<b>Hollister Street</b>		
Main Street to Marian Avenue	Opening year 2021 plus project direct project effect	Prior to issuance of the first building permit, Owner/Permittee shall assure the re-striping of Hollister Street between Main Street and Marian Avenue to add a continuous two-way left turn lane, satisfactory to the City of Chula Vista Engineer and the City of San Diego City Engineer. All improvements must be complete and operational prior to first occupancy.
Marian Avenue to North Project Limit	Opening year 2021 plus project direct project effect	No improvement – this section of roadway is currently not wide enough to re-stripe a two-way left-turn lane
North Project Limit to South Project Limit (Project Frontage)	Opening Year 2021 Plus project direct project effect.	Prior to issuance of the first building permit, Owner/Permittee shall assure by permit and bond the widening of Hollister Street along the project frontage by 16 feet and the restriping of Hollister Street to include two lanes of travel, a continuous two-way left turn land and buffered bike lanes, satisfactory to the City of San Diego City Engineer. All improvements must be complete and operational prior to first occupancy.
South Project Limit to Conifer Avenue	Horizon year 2050 plus project cumulative project effect	No improvement – this section of roadway is currently not wide enough to re-stripe a two-way left-turn lane
Conifer Avenue to Palm Street	Opening year 2021 plus project direct project effect	Prior to issuance of the first building permit, Owner/Permittee shall assure the re-striping of Hollister Street between Conifer Avenue and Palm Avenue to add a continuous two-way left turn lane, satisfactory to the City of San Diego City Engineer. All improvements must be complete and operational prior to first occupancy. Improvement will require removal of on-street parking along the east side of Hollister Street.
<b>Palm Avenue</b>		
I-5 NB Ramps to Hollister Street	Horizon year 2050 plus project cumulative project effect	No improvement – City of San Diego does not currently have a project on Palm Avenue for the developer to pay a fair share contribution towards.

## 11.3 SUMMARY OF FREEWAY ANALYSES

**Table 11-4** displays the freeway speed, density, LOS at all the study freeway facilities for the different scenarios analyzed. As shown in the table, all study freeway facilities would operate at LOS D or better with the addition of the proposed project except for the I-5 Northbound Palm Avenue Off-Ramp, I-5 Southbound Main Street Off-Ramp, and the I-5 Southbound weave segment between Main Street and Palm Avenue. These segments are expected to operate at a LOS E or F during the AM or PM peak period under Opening Year (2021) and Horizon Year (2050) Conditions. The diverge and weave segments would not be negatively affected by the project and no project effect would occur.

**Table 11-5** displays the freeway off-ramp 95<sup>th</sup> percentile queue lengths for the study area intersections. This determines whether queue lengths can be expected to affect freeway mainline operations based on the storage length available for the off-ramps. As shown in the table, the following off-ramp will be affected by project traffic:

- I-5 Southbound at Main Street (Horizon Year Plus Project Cumulative project effect)

The queuing issue at this intersection is a result of large growth of volumes associated with cumulative projects and the operational deficiency identified in the intersection analysis. The proposed project contributes a small portion of volumes to this ramp in comparison to the overall growth and would not independently create queues beyond the ramps. Queues could be improved with construction of a signal or roundabout, similar to operational improvements identified. However, the City of San Diego and City of Chula Vista do not currently have a project at this location for the developer to pay a fair share contribution towards. Therefore, no improvement is required as part of this project.

Table 11-4 Summary of Freeway Level of Service Analysis

Freeway Facility	Facility Type	Peak Hour	Existing Conditions			Opening Year (2021) Conditions			Opening Year (2021) with Project Conditions					Horizon Year (2050) Conditions			Horizon Year (2050) with Cumulative Project Conditions			Horizon Year (2050) with Project Conditions				
			Speed (mph) (a)	Density (pc/mi/ln) (b)	LOS (c)	Speed (mph) (a)	Density (pc/mi/ln) (b)	LOS (c)	Speed (mph) (a)	Density (pc/mi/ln) (b)	LOS (c)	Δ in density (pc/mi/ln)	Effect? Notes:

**Bold** values indicate roadway segments operating at LOS E or F.

(a) Speed is measured in miles per hour (mph).

(b) Density is measured in passenger cars per mile per lane (pc/mi/ln).

(c) LOS calculations based on methodologies outlined in the 6th Edition HCM and performed using HCS 7.

(d) HCM models may under-predict the extent of congestion in oversaturated conditions.

Table 11-5 Freeway Off-Ramp Queue Summary

Intersection	Intersection Control Type (a)	Off-Ramp Storage Length (ft) (b)	Peak Movement	Peak Hour	95 <sup>th</sup> Percentile Queue Lengths (ft)						
					Existing Conditions	Opening Year (2021) Conditions	Opening Year (2021) with Project Conditions	Horizon Year (2050) Baseline Conditions	Horizon Year (2050) with Cumulative Project Conditions	Horizon Year (2050) with Project Conditions	
I-5 SB Off-Ramp at Main Street	SSSC	1,500	SB	AM	118	183	194	207	ERROR (d)	ERROR (d)	
				PM	211	253	328	473	ERROR (d)	ERROR (d)

				PM	329	367	388	545	609	609	
I-5 SB Off-Ramp at Palm Avenue	Signal	1,400	SB	AM	389	408	408	643	643	647	
				PM	750	784	785	1001	1001	1001	
I-5 NB Off-Ramp at Palm Avenue	Signal	1,100	NB	AM	227	244	266	657	657	687	
				PM	163	173	187	320	320	400	

Notes:

(a) SSSC = Side Street Stop Control, Signal = Traffic Signal.

(b) Off-ramp storage length measured from theoretical gore point to intersection stop bar for longest lane.

(c) 95th percentile queue determined based on Synchro 6th Edition results for signalized intersections, and Synchro 2000 queue reports for unsignalized intersections as Synchro 6<sup>th</sup> Edition does not provide queue results for unsignalized intersections.

(d) Error indicates the capacity of the intersection approach is exceeded by a number that cannot be defined.

\* \* Northbound off-ramp becomes southbound approach to ramp terminus intersection.

## 11.4 SUMMARY OF PARKING

The project will provide more parking spaces than is required by the City of San Diego Municipal Code for its proposed uses. The project will also provide bike racks for a total of 92 bikes.

## 11.5 ALTERNATIVE MODES OF TRANSPORTATION

The project is located in the Otay-Mesa Nestor community of San Diego is located approximately 1,500 feet from the Palm Avenue Transit Station. The site is well served by the existing transit network, however pedestrian and bicycle connections to the trolley station and northbound bus line are lacking accessible infrastructure along Hollister Avenue. Pedestrian and bicycle connection to both the north and south of the site are currently lacking facilities and opportunities to provide them are limited by the current street width.

The development of the project site will include the following improvements for alternative modes of transportation:

- Stripe buffered bike lanes along the project frontage.
- Relocate the southbound bus stop on Hollister Street for Bus Route 932 to be in front of the project site.
- Construct a bus stop on northbound Hollister Street for Bus Route 932 across from the project site.
- Construct a mid-block crossing across Hollister Street on the north side of the southern project driveway with a rectangular rapid flashing beacon (RRFB). Mid-block crossing warrant evaluation provided in **Appendix F**.
- Construct non-contiguous sidewalk facilities along the project frontage on southbound Hollister Street
- Construct non-contiguous sidewalk facilities along northbound Hollister Street from the proposed bus stop to the proposed mid-block crossing.
- Construct temporary accessible sidewalk along southbound Hollister Street between the project site and Conifer Avenue.
- Provide decomposed gravel path on northbound Hollister Street for connection to Otay Valley Regional Trail system per agreement with the City of San Diego Parks and Recreation Department.

These multi-modal improvements will provide mobility options for Bella Mar residents to access the Palm Avenue Trolley Station.

## APPENDICES

- Appendix A** Existing Traffic Count Data
- Appendix B** Existing Traffic Signal Timing Data
- Appendix C** Otay Mesa-Nestor Community Plan
- Appendix D-1** Intersection LOS Worksheets – Existing Conditions
- Appendix D-2** Intersection LOS Worksheets – Opening Year (2021) Conditions
- Appendix D-3** Intersection LOS Worksheets – Opening Year (2021) with Project Conditions
- Appendix D-4** Intersection LOS Worksheets – Horizon Year (2050) Baseline Conditions
- Appendix D-5** Intersection LOS Worksheets – Horizon Year (2050) with Cumulative Project Conditions
- Appendix D-6** Intersection LOS Worksheets – Horizon Year (2050) with Project Conditions
- Appendix E** Freeway LOS Worksheets
- Appendix F** Mid-Block Pedestrian Crossing Warrant
- Appendix G** Cumulative Project (Otay River Business Park) Information
- Appendix H** SANDAG Travel Forecast Information Center Data
- Appendix I** Striping Concept for Hollister Street
- Appendix J** Horizon Year (2050) Intersection Volume Information
- Appendix K** Cumulative Project (Salt Bay Design District) Information
- Appendix L** Bus Route Information
- Appendix M** CEQA VMT Memorandum (including SANDAG VMT screening map)

Anytime Mychal. I was going to add that the “operating window” when they are operational would be from 0530 – 0930 Monday to Friday and they would be 2 cars per green.

**Subject:** RE: Bella Mar (408 Hollister) Traffic Study Scope

Good Morning Mychal,

Regarding the Main St and Palm Ave to NB I-5 Ramp Meters, the hardware is on the on-ramp, however, they are not yet operational. These Meters will be ready to operate after the Traffic Analysis and public notification is complete.

For now, a good range to use for the Palm Ave to NB 5 Meter would be 850 to 400 veh/hr. Main St should be 900 to 480 veh/hr. SB I-5 near these SB on-ramps may be activated in the future depending on ML volumes.

Let me know if you have any other questions. Thank you,

---

**Subject:** RE: Bella Mar (408 Hollister) Traffic Study Scope

Hi Roger,

Thank you very much for your email. I suggest contacting Shahin Sepassi, Shahin Adibi, Hassan Chowdhoury or Douglas Hooper from the Ramp Metering Branch at the TMC for information regarding ramp metering rates. Ken Sayler was the Project Engineer of the project that installed ramp meter systems at the Palm Ave and Main Street NB on-ramps to enter I-5. He may have additional information.

There is currently a SB on ramp to enter I-5 from WB Main Street (loop on-ramp). There are currently two SB on-ramps to enter I-5 from Palm Ave (WB Palm Ave to SB I-5 loop on-ramp, and EB Palm Ave to SB I-5 diamond on-ramp). It appears that none of those ramps is metered.

Our 11-43033 project proposes loop detectors at certain ramps of the I-5/Main Street and I-5/Palm Ave interchanges as listed below:

| Junction Route 75 |                                      |       |    |                                                                                          |
|-------------------|--------------------------------------|-------|----|------------------------------------------------------------------------------------------|
| 23                | NB OFF TO PALM AVE / 75              | 4.464 | ND | CS 822 Bad loops (See Rte 75): Lane 2 SB 75 to NB 5 and SB 75 to SB 5 need loop repairs. |

**Subject:** RE: Bella Mar (408 Hollister) Traffic Study Scope

Hello,

Just to clarify for the ramp metering analysis:

- The Northbound Ramps to enter I-5 at both Main and Palm are existing. We will include those in all scenarios
  - o Do you have ramp meter rates that we should use? Or assume a general 450 veh/hr/ln?
- The Southbound Ramps to enter I-5 at both Main and Palm do not exist; we are planning to assume they will be in place in our buildout (Year 2035) scenario

Let us know if you rate info you can share, and any other feedback on the above.

Thanks!

**Subject:** RE: Bella Mar (408 Hollister) Traffic Study Scope

Hi Mychal,

In addition to our Traffic Branch being Okay with your Traffic Scope, we found three improvements in the area,

- Ramp Metering on both Main and Palm Avenue, please see the Monster DSMP excel sheet list and the link to the Ramp Metering Plan. (see attachment)
- The 2010 I-5 South Multimodal Corridor Study project summary report mentions improvements to the Main Street Overcrossings. (see attachment)
- The Monster DSMP calls for adding managed lanes to the corridor in this area. (see attachment)

<http://www.dot.ca.gov/trafficops/tech/docs/RampMeteringDevelopmentPlan.pdf>

<https://www.sandag.org/index.asp?classid=13&projectid=387&fuseaction=projects.detail>

Our Trade Corridor Improvement branch (TCIF) is currently in the early stages of putting together a SHOPP study that would identify locations/interchanges that need improvements in this area. We asked TCIF if they could share any possible improvements that they may have already identified, they should get back to us next week.

I will be on vacation starting next week, I have asked Roy Abboud (thank you Roy) to cover this project review while I am gone. Please follow up with him and cc Jacob next week for any additional improvements that our TCIF branch may provide.

Thank you

Hi Mychal,

We are good with the traffic scope. We are still looking into anything we can find as far as I-5/Main St. and will get back to you, but can also work with you on exploring any options. Thanks

Just a quick update - I don't see anything related to the Main St and I-5 Southbound ramps in the Chula Vista Western TDIF. It had a signal included for the northbound ramps, which has been built, and Main Street bridge widening, but nothing mentioned about the southbound ramps. I am confirming with City of Chula Vista staff.

We will explore possible mitigations – off-ramp widening to provide a turn lane, a signal, or a roundabout. Not sure if we will have a chance to not require the applicant to fully fund and build it; but let me know if your team finds anything further to guide how you all envision that intersection to operate.

Hi Mychal. Hope all has been well. Thanks for reaching out to us. Let me look into this and get back to you. We will check on I-5/Main. One thing that comes to mind is I believe the Chula Vista Western TDIF has improvements identified? We will get back to you.

Yes, sorry your Beavers has a rough year. I remember the glory years in the late 90's early 2000's when I was at Oregon and the Civil War was the game of the year for the conference. Things will get better!

Hi Jacob,

We are working on a traffic study for a proposed multi-family residential development in the City of San Diego's Otay Mesa-Nestor community, project name Bella Mar. The project is close to I-5 and both the Main Street and Palm Avenue interchanges are assumed to be a major part of the traffic study. So while the City of San Diego will be the approving jurisdiction, we want to include Caltrans in the traffic scope. The attached scope letter is attached and being shared with City of San Diego, City of Chula Vista, and Caltrans representatives. We are moving forward with the traffic study and aiming to meet a January submittal.

We are seeing that the existing conditions at the Main St/I-5 interchange has deficient operations. Are there any plans in place to improve that interchange? Or where is the best source to look for that info?

## **I. EXECUTIVE SUMMARY**

## EXECUTIVE SUMMARY

---

The Otay Mesa-Nestor Community Plan (Plan) process analyzed existing conditions to determine the community's positive attributes and identified areas or conditions in need of improvement. The Plan identifies issues, articulates community visions, and recommends strategies for improvement and for achieving the visions.

One of the most significant issues identified by residents is the general lack of identity of the community as a unique part of San Diego. Due to its conventional residential character, the absence of a distinct business center, the fragmentation of the community into several neighborhoods, and the neglect of Otay Mesa-Nestor's natural resources, a strong, recognizable community image has not been established. Residents feel that their community has been neglected by the City, and that they are not receiving an equitable share of City services and resources.

Unexpected growth in the area has brought additional problems. One-third of the population is school age or younger. School overcrowding is increasing. A series of amendments to the adopted community plan resulted in the addition of residential areas and increased residential densities, thus exacerbating school and other public facility deficiencies. The increase of residentially planned land reduced opportunities for commercial development. Future planned growth in Otay Mesa will place an added strain on the community's facilities until adequate facilities are provided to serve Otay Mesa. Older neighborhoods are showing signs of deterioration and are in need of rehabilitation. Border related commercial traffic through the community impacts previously quiet residential streets. Graffiti and lack of street maintenance are issues of growing concern.

Recognizing that Otay Mesa-Nestor is a mostly built out, urbanized community, this Plan employs a new approach. It focuses on specific geographic areas and communitywide issues in a comprehensive manner, unlike more traditional community plans that address land uses and services in independent elements.

The Plan introduces the concept of neighborhood centers as potential opportunity areas for improvement and revitalization. The Plan proposes a concentration of neighborhood and community-serving uses in neighborhood centers, including the augmentation of existing, and the establishment of new neighborhood centers. The Plan acknowledges that Otay Mesa-Nestor is a conglomeration of distinct neighborhoods, and that existing development patterns dictate the form of the community. Rather than try to create one artificial central community core, each center will provide a neighborhood focus and help create local identity and pride. Combined, the neighborhood centers will provide a wide range of shopping and commercial services, open space and recreation, civic and transit-oriented uses, and residential opportunities to the community. The cumulative effect of building the community incrementally by reinforcing and modifying the unique aspects of existing neighborhoods will result in a distinct community identity.

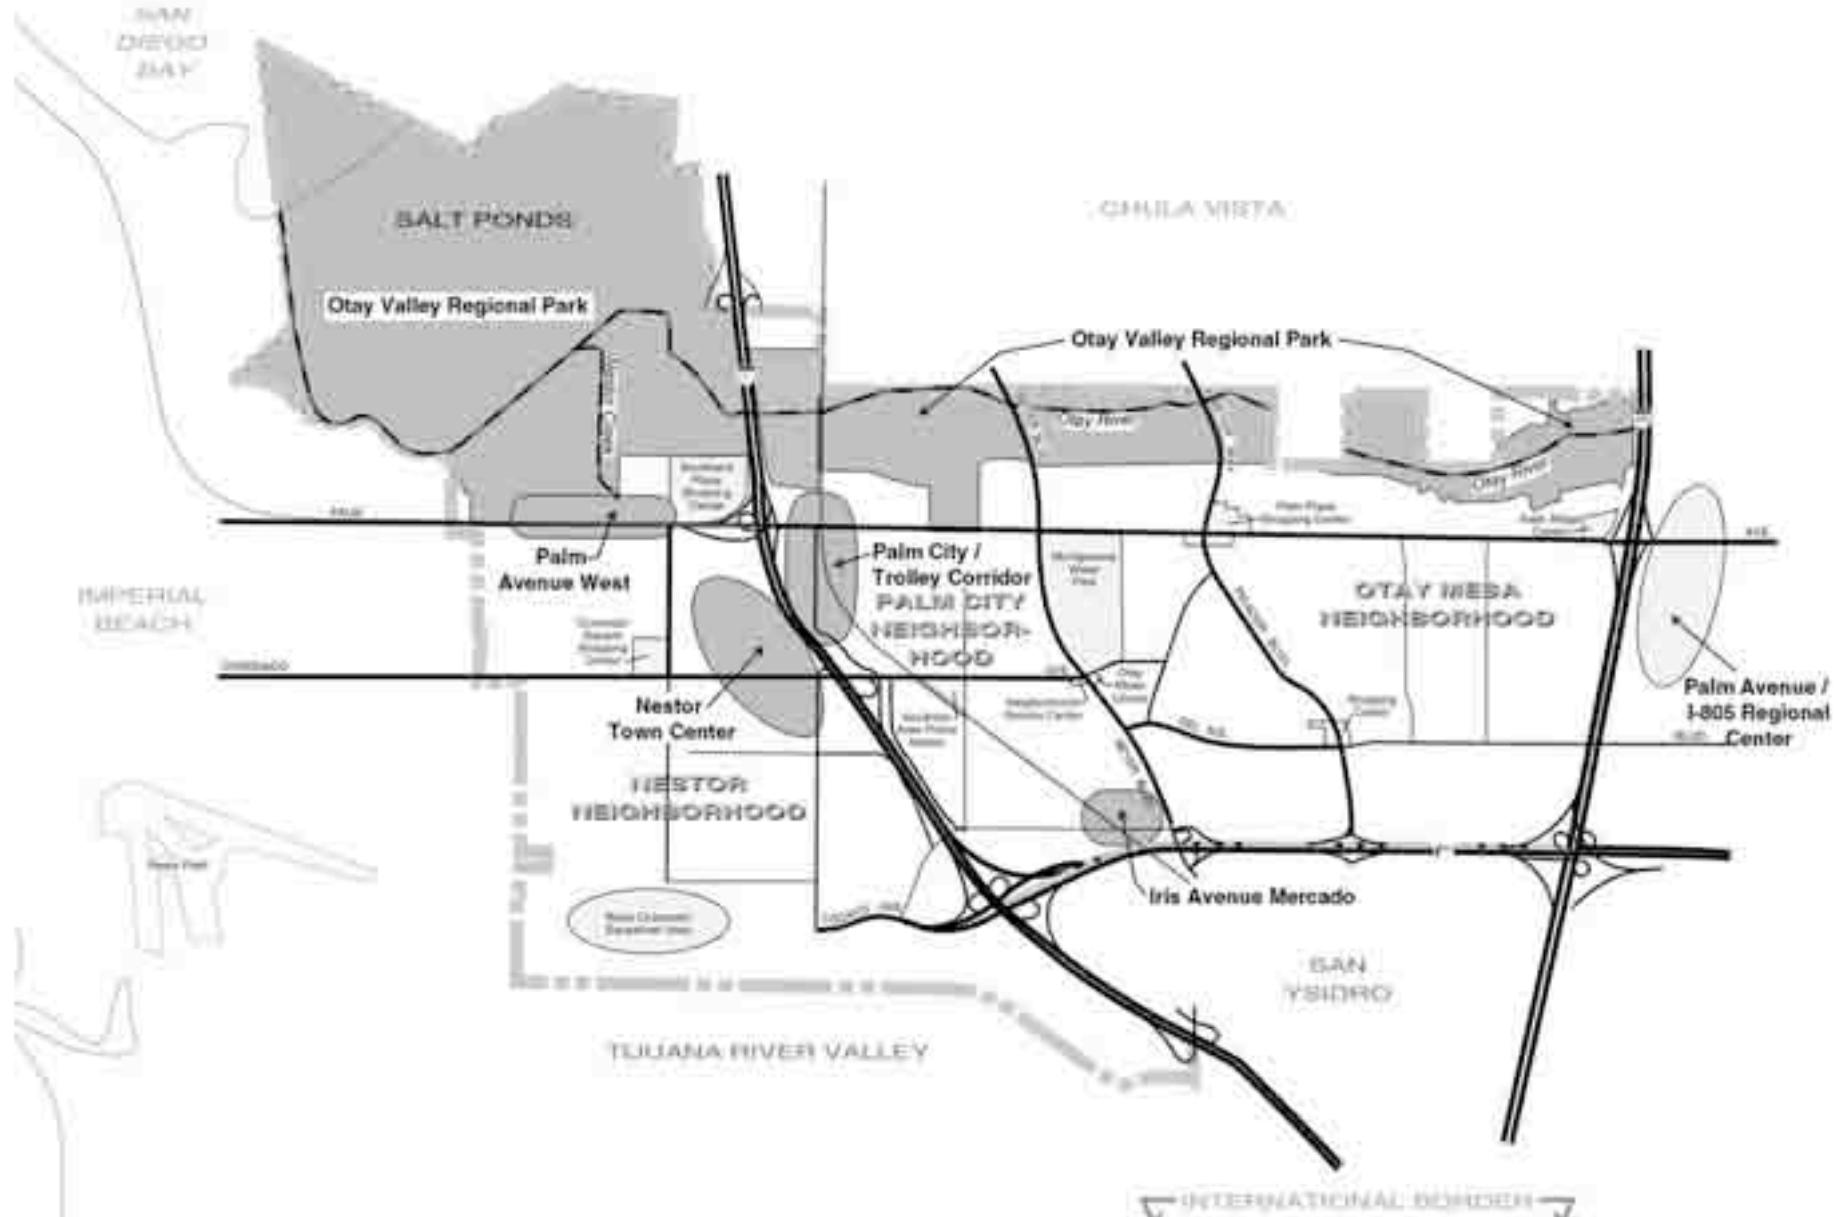

In addition to the neighborhood centers addressed by the Topic Sheets and highlighted on the Vision Map, other existing neighborhood centers are also identified on the Community Vision map (see **Figure 1**) and discussed in the Introduction. Continued development consistent with the planned land use is recommended in these areas, which contributes to strengthening the community fabric.

The community improvement programs and strategies address communitywide issues that are not specific to one neighborhood center or geographic area. They include housing programs and provision of community facilities and services. They also recommend strategies for public education about the community planning process, and citizen involvement and responsibility for improving the community.

Fundamental to the successful implementation of this action-oriented Plan, is the creation of the Community Plan Implementation Team (described on page 10). It is intended that this Plan will be a guide for the orderly and deliberate improvement of the community by the cooperative efforts of community members, private interests, the City and other development and regulatory agencies.

## **II. INTRODUCTION**

Community Vision  
Otay Mesa-Nestor Community Plan

## INTRODUCTION

---

### SCOPE AND PURPOSE

This Otay Mesa-Nestor Community Plan (Plan) represents the first comprehensive update of the original Otay Mesa-Nestor Community Plan that was adopted in December, 1978. Development of the Plan was a joint effort of the Otay Mesa-Nestor Community Planning Committee and City Planning Department staff. Because the community is approximately 95 percent developed, the planning process used in creating this Plan went beyond the scope of the traditional land use plan. A wide range of issues identified by community members, business operators, and residents was addressed. The purpose of the Plan is to serve as a guide for the future development and improvement of the community. This Plan incorporates the Local Coastal Program for the Otay Mesa-Nestor community.

### PLAN APPROACH

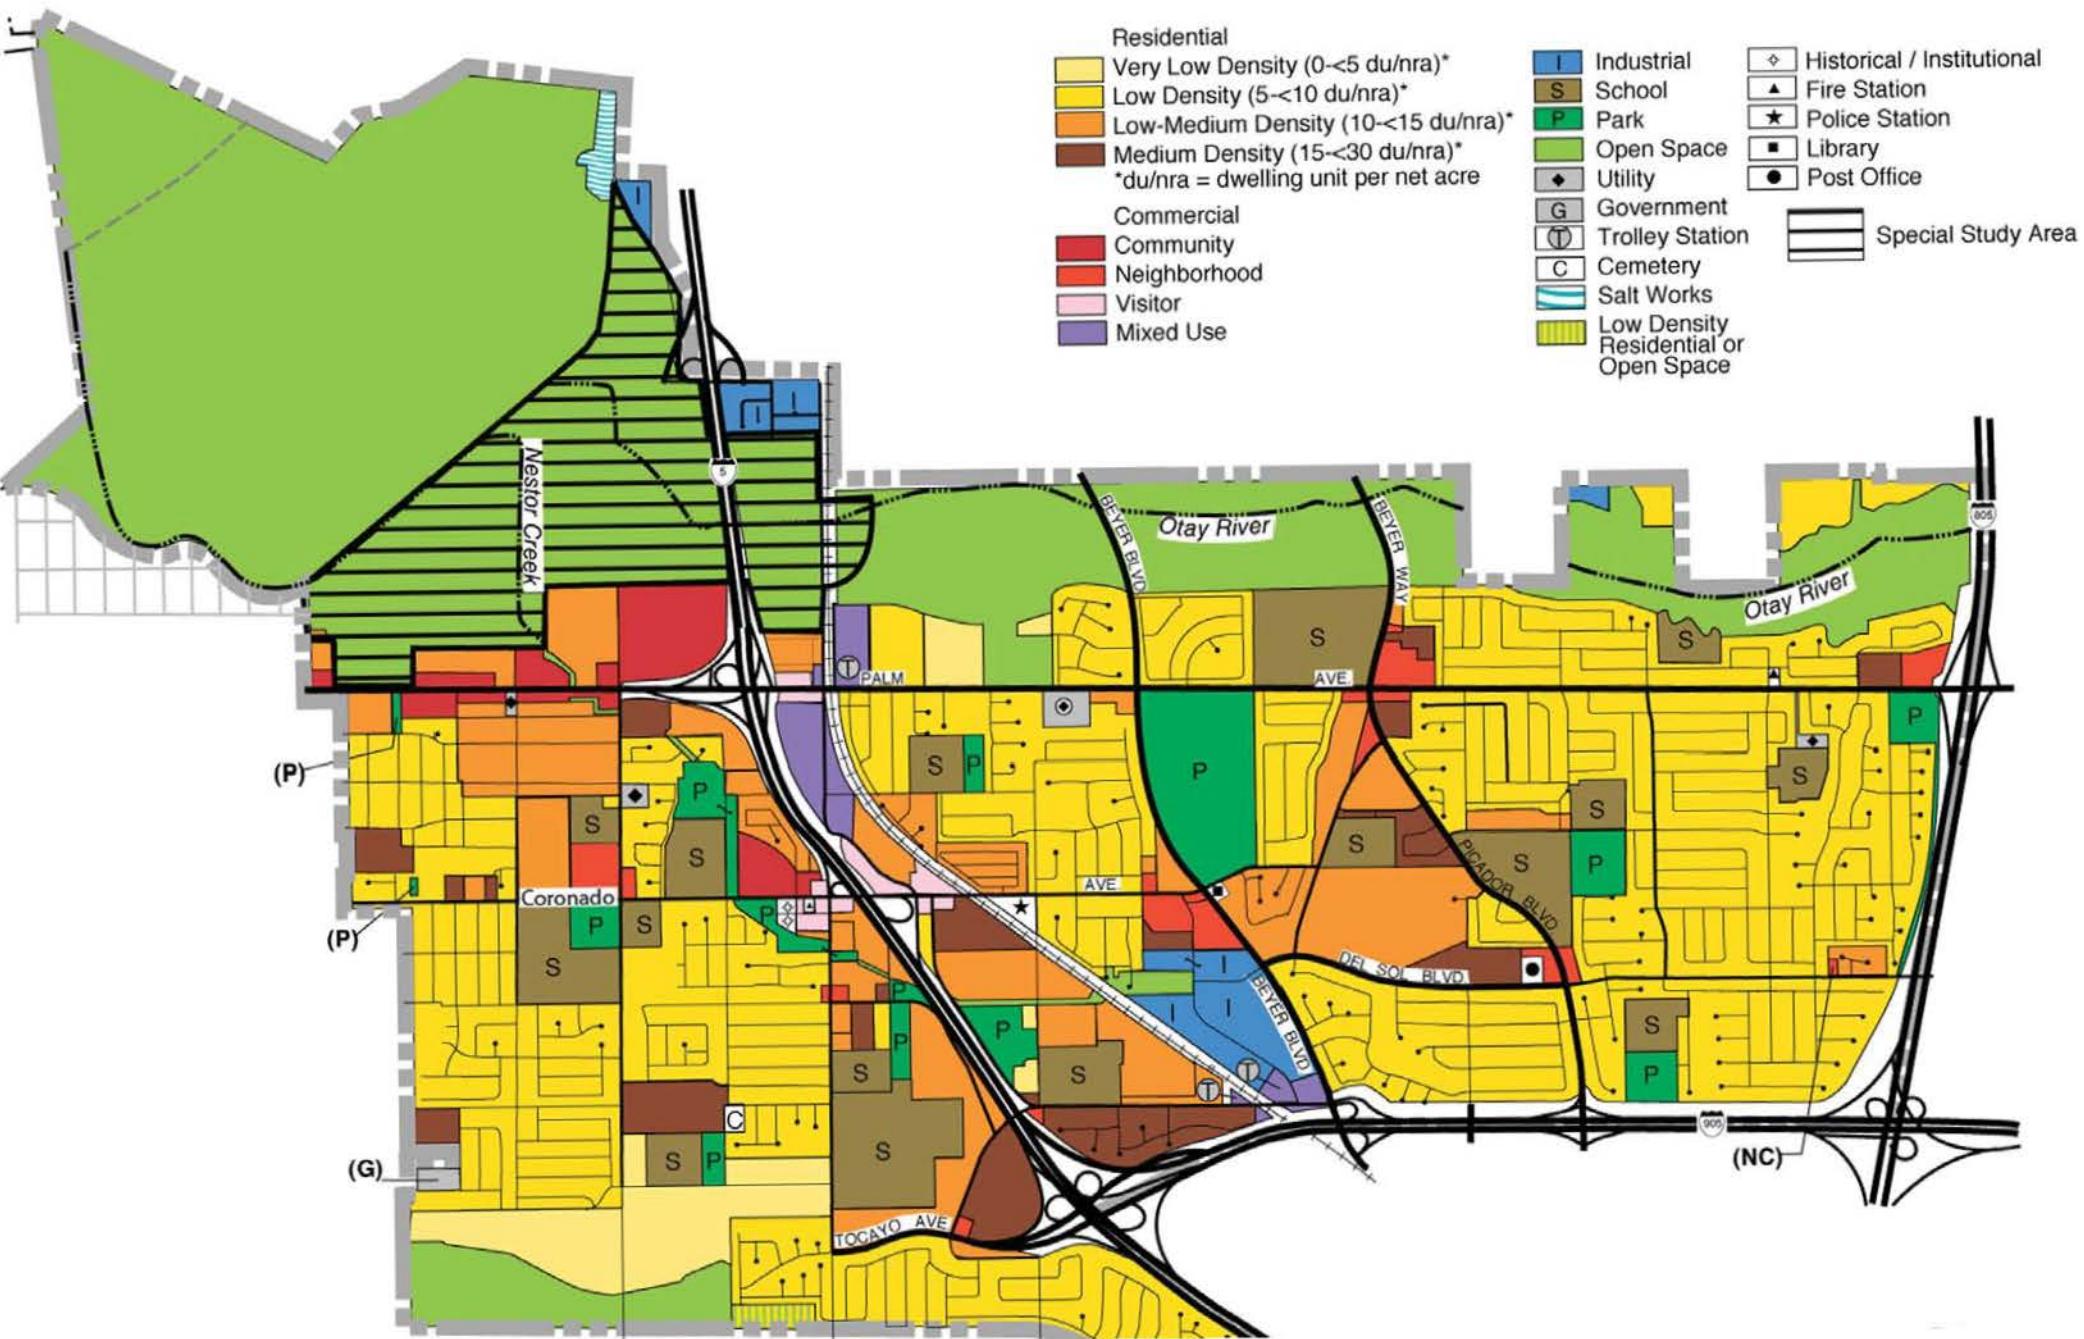

The approach used in creating this Plan relied heavily upon the foundation provided in the Community Conditions Report (October, 1993), a comprehensive assessment of existing conditions that provided a basic knowledge of the community. It includes detailed information about the history of the community, its demographics, and existing land uses. The Otay Mesa-Nestor Community Conditions Report is available for review or purchase through the City Publications Center.

In addition to the Community Conditions Report, the update process utilized a community survey. The survey provided community members an opportunity to provide their opinions about the community. It was designed to identify issues, problems, strengths, and positive attributes that are desired to be preserved.

A prevailing issue identified during the plan update process is the general lack of identity and lack of a strong community core. By addressing individual neighborhood centers and unique natural areas that have potential for improvement, the Plan emphasizes opportunity areas that could augment the community's existing strengths and provide neighborhood identity. The combination of the existing vital neighborhood areas with the future improved areas recommended in this Plan will create the foundation for a vibrant, balanced community.

Each of the community's neighborhoods is unique, reflecting different eras of development, different topography and natural features, and distinct neighborhood centers. Together, these areas provide a wide range of residential, civic, shopping, employment and recreational opportunities. Collectively, they contribute to a community of neighborhoods.

The following are some of the strengths and attributes that were identified as worthy of perpetuation and preservation:

- Quiet and safe neighborhoods.
- Single-family homes mostly owner occupied.
- Affordable housing.
- Ethnically diverse community.
- Close knit neighborhoods.
- Feeling of "small town" community where there is no fear of letting children out to play.
- Good neighbors - less crime and fear.
- Recreational facilities and programs.
- Proximity to Otay River Valley and Tijuana River Valley.

## OTAY MESA-NESTOR NEIGHBORHOODS

Otay Mesa-Nestor is comprised of several neighborhoods, each including one or more neighborhood centers or focal points, in addition to parks and schools. Some of these neighborhood centers have been identified as having revitalization potential or providing opportunities for enhancement, and are addressed by the Topics. Other existing neighborhood centers and unique areas are considered to be in healthier condition and contribute to the community's cultural and economic diversity and vitality. The centers are identified on the Community Vision map (**Figure 1**). The following is a brief description of the community's principal neighborhoods and their neighborhood centers.

### *Nestor*

This older neighborhood is located between Interstate 5 (I-5) and Saturn Boulevard, and bordered by the Salt Ponds on the north and the Tijuana River Valley to the south. In addition to containing Nestor Town Center (Topic 2B) it includes several small neighborhood commercial centers. The portion of the neighborhood south of Leon and Tocayo Avenues retains a rural character by maintaining existing large lot residential development and equestrian uses.

### *Egger Highlands*

Located west of Saturn Boulevard between the Salt Ponds and the Tijuana River Valley, Egger Highlands is the gateway to the City and the community from Imperial Beach. It includes Palm Avenue West (Topic 2C), which is the main commercial and circulation corridor in this part of the community, and has revitalization potential. The community's largest shopping centers, Southland Plaza and Coronado Square, are also located in this neighborhood.

### *Palm City*

Palm City, historically the transportation hub for the community, is characterized by the variety of land uses located along the trolley corridor, including the community's two industrial parks. The proposed mixed use Palm City (Topic 2A) and Iris Avenue Mercado (Topic 2D) neighborhood centers will revitalize the areas of the community's two transit stations. The Southern Area Police Station is centrally located in this neighborhood.

## *Otay Mesa*

This newer, primarily residential neighborhood, contains several smaller commercial centers including Palm Plaza and the Palm Ridge Shopping Center. A neighborhood commercial center is located at the intersection of Del Sol and Picador Boulevards. Montgomery-Waller Park, the Otay Mesa Branch Library, the City's Neighborhood Service Center and another shopping center form a civic and commercial focus in the vicinity of Coronado Avenue and Beyer Boulevard.

Although not specifically addressed by the plan Topics, the plan supports the established neighborhood centers by designating appropriate land uses and applying corresponding zoning. Continued development consistent with the planned land use is recommended in these areas.

## **COMMUNITY PLAN IMPLEMENTATION AND CITIZEN PARTICIPATION**

It is intended that by focusing on the key community issues in a concise, topic-oriented format, that this Plan is an effective planning and communication tool for community improvement. The plan approach should not only facilitate plan implementation, but also foster community involvement. It provides strategies and direction for numerous community improvement projects. While not being able to fully control all the factors that will contribute to plan implementation such as private investment, public funding, and unforeseen social and economic trends, community members can use this Plan as a guide for future development. By prioritizing the topics, community members can begin working with the City, other agencies, and private interests to direct funding and revitalization resources to those areas of the community where they are needed most.

Another prevailing issue identified during the plan update process is the community members' perception that their voice, and the interests of their community, are not heard and considered as strongly as those of other communities. Through the formation of the Community Plan Implementation Team and the direction provided by this plan, community members can increase their involvement and commitment to improving their own community and improve their effectiveness in influencing local government and other forces that ultimately shape the quality of life in Otay Mesa-Nestor.

## **COMMUNITY PLAN IMPLEMENTATION TEAM**

### *Issues*

Community improvement recommendations contained in community plans frequently go unrealized. This is due in part because of poor communication and coordination within the City organization and because community-based organizations are often poorly connected with City Hall. Also, funding for implementation programs is almost always inadequate. Plan implementation has particularly been a problem in urbanized areas where most neighborhood improvement projects require services and expertise from a variety of City departments, outside agencies and community groups.

### *Strategies*

Develop and put into effect a multi-disciplinary approach (a team comprised of City staff, community representatives, community planning members, business operators, students, and other agencies as needed) toward implementing the community plan.

The team shall be involved in implementing the visions, strategies and other recommendations contained in the maps, topics and appendices in this community plan.

The team shall create a community plan implementation work plan and assign priorities and develop a schedule to carry out the plan.

Foster public participation through focused outreach and education programs. Fully utilize the services provided by the Neighborhood Service Center as a community-City agencies liaison. Provide technical support to the community as needed. Represent the community's interest at City Hall.

The Team will ensure its commitment and accountability to the community by holding regular meetings, biannual community meetings, and issuing progress reports annually to the Planning Commission and City Council on the team's progress in implementing the community plan.

### *Responsibility*

The City Manager, working with the community, shall be responsible for creating the Team. The Team shall have representatives from City departments as needed.

To ensure its long-term commitment, the City will strive to adequately staff the Team.

### *Schedule*

Create the Team and commence community plan implementation immediately following plan adoption.

## PLANNING CONTEXT

---

### THE COMMUNITY PLANNING AREA

The Otay Mesa-Nestor Community is located within the southern region of the City, in what is generally referred to as the South Bay area. It is bounded on the north by the city of Chula Vista, and on the south by the Tijuana River Valley and the San Ysidro Communities. The city of Imperial Beach is on the west and the Otay Mesa community on the east.

The community extends about a mile and a half from north to south and four miles from east to west, and totals approximately 4,500 acres. Adoption of this update will expand the community planning area further north and west to include 740 acres of the Salt Ponds.

### DEVELOPMENT AND PLANNING HISTORY

The community's planning history as part of the City of San Diego (City) began in 1957 when this unincorporated area was annexed to the City from the county of San Diego. In 1957 there were less than 1,000 housing units in the area. Shortly after annexation to the City, single-family residential subdivision development began. By the late 1960s, residential development had accelerated dramatically causing serious problems in supplying adequate public facilities in the Otay Mesa-Nestor and San Ysidro areas. In 1973, the City Council rezoned a number of vacant properties to a lower density to reduce deficiencies in, and future demand on, public facilities and services.

The City Council directed City staff to work with the then newly recognized Otay Mesa Community Planning Group in the preparation of a Community Plan. In February 1976, the City Council authorized expansion of the study area to include the Nestor Community, to consolidate planning efforts within the South Bay area. The first Otay Mesa-Nestor Community Plan was adopted in 1979 to serve as a comprehensive guide for development within the area through the ensuing 15 to 20 years.

Since the adoption of the 1979 Plan, there have been fifteen plan amendments varying from one-acre redesignations to a 320-acre southerly extension of the plan area boundary, which resulted in an adjustment to the Tijuana River Valley community planning area. The cumulative effect of the plan amendments was to permit 1,200-1,500 more residential units than had originally been designated in the 1979 Plan.

Many of the land use recommendations of the 1979 Plan, and its subsequent amendments, have been implemented and the community has generally developed according to plan. This updated Plan has considered existing and anticipated conditions which will influence future development, and includes recommendations for the expected final buildout and future redevelopment of the Otay Mesa-Nestor Community.

## URBAN AND ENVIRONMENTAL SETTING

The Otay Mesa-Nestor Community is located in the southern portion of the Coastal Plain of San Diego County. The community is characterized by river valleys, steep slopes, mesas and hydrologic features including Nestor Creek and the salt evaporation ponds of southern San Diego Bay.

### *Otay and Tijuana River Valleys*

Two river valleys, the Otay and the Tijuana, generally define the northern and southern boundaries, respectively, of the community. The valleys, which are characterized by wetlands and riparian habitats, are predominately influenced by seasonal rains and stream flow. Land uses in the fertile and productive valleys have included agriculture and mineral extraction. Development within the valleys is constrained by application of the Floodway Zone and the Floodplain Fringe Overlay Zone.

### *Sand and Gravel Operations*

The Otay Valley riverbed has been a source of sand and gravel extraction for many years. Extraction operations existed in the vicinity of Beyer Boulevard. Terrace escarpments in the vicinity of Beyer Way, north of Montgomery High School, are currently being excavated. These operations have resulted in substantial landform alteration, scarring and loss of native vegetation on the valley's floor and southern slopes.

### *Steep Slopes and Mesas*

Steep, north-facing slopes on the south side of the Otay River Valley approach 200 feet in height and are home to sensitive vegetation resources. Steep topography also occurs south of the Otay River Valley and north of Palm Avenue between Hollister Street and Beyer Way. Development on the slopes is constrained by topography and the Hillside Review Overlay Zone.

Contrasting with the valleys and steep bluffs are the community's level marine terraces and transitional areas. Elevations range from 25 to 100 feet within the western Nestor Terrace. Elevations from approximately 125 feet to 250 feet form a transition zone between the Nestor Terrace and the Otay Terrace, which lies east of the community and is greater than 400 feet in elevation. Mesa rims at the crest of the steep slopes, and high mesa ridgelines located throughout the eastern portion of the planning area offer excellent view opportunities in all directions.

### *Nestor Creek and the Salt Ponds*

In addition to the two river valleys, Nestor Creek is a less significant, but still important hydrologic feature of the community. Nestor Creek flows generally aboveground in open channels from 30th Street westerly, meets the Otay River in the marshlands of the lower Otay River Valley, and then empties into San Diego Bay.

The salt evaporation ponds comprise the majority of the approximately 740-acre portion of the community located in San Diego Bay. Terrestrial-based uses, including the salt processing plant, auxiliary buildings, storage yards and vacant land, comprise the remainder of the area.

#### *Development and Circulation Patterns*

Otay Mesa-Nestor is an urbanized community that is primarily developed with residential land uses. Over 57 percent of the planning area (not including the Salt Ponds) is covered with residential land uses (approximately 17,000 housing units). In comparison, commercial and industrial land uses comprise only eight percent (five percent and three percent, respectively) of the plan area. Twenty percent of the planning area consists of schools, parks, transit and other public facilities. Vacant, undeveloped, agricultural and mineral extraction and processing uses comprise the remaining 15 percent of the planning area, and occur predominately in portions of the Otay and Tijuana River Valleys.

The community's circulation system includes three interstate freeways (I-5, I-805, I-905) that intersect in a grid pattern of local streets within the community. A light rail transit system connects the community to downtown San Diego and the Mexican border. Bus routes link the two transit stops at Palm Avenue and Iris Avenue to connect passengers to outlying areas.

## PLAN ORGANIZATION

---

The Otay Mesa-Nestor Community Plan is comprised of the following three main components:

### 1. COMMUNITY VISION/COMMUNITY LAND USE MAP

The Community Vision Map and statements represent the future and describe the vision of an improved quality of community life that includes conservation of natural resources, adequate provision of public services and facilities, and revitalized neighborhoods. The Visions found at the beginning of each Topic or section, set the tone of the Plan and are the basis for the Plan's recommendations. The Vision map illustrates the general setting of the community relative to other South Bay communities and highlights its distinct existing and proposed neighborhood features.

The Community Land Use Map designates land uses for the entire community planning area. These land uses are consistent with the strategies and guidelines recommended in the Topic Sheets and the Appendix. The Commercial Land Use Designations and Residential Densities charts explain the predominant land use designations of the Land Use Map. The Street Classifications map designates community streets according to City standards.

The Community Land Use Map may be used as an independent document that conveys the community's basic characteristics, planned land uses, and vision for the future. Readers interested in learning more about the community including specific issues, strategies, and guidelines can refer to the Introduction, and the two other main plan components, the Topic Sheets and Appendix.

### 2. TOPIC SHEETS

Each Topic Sheet includes a discussion of the issues and provides strategies to implement the related community vision. Each Topic Sheet addresses either a geographic area within the community or a subject relevant to the entire community. Topics are grouped in chapters by subject. Most chapters address more than one Topic, although two chapters are single-Topic.

The format organizes categories of information in a similar outline on each of the Topic Sheets. The format allows flexible arrangement of individual map and graphic information. Each Topic Sheet contains all or some of the following categories of information:

- **Vision**

Vision statements represent community members' desires for a future improved quality of community life, relative to the particular Topic. Written in the future tense, they present an image of the community as it will be after the community plan

strategies, guidelines and recommendations have been implemented. Visions are either provided at the beginning of each Topic category when there is only one Vision for several sub-Topics (e.g., Community Facilities, Topic 4), or provided for individual sub-Topics, as appropriate (e.g., Palm City, Topic 2a).

- **Issues**

This category identifies the existing and potential future conditions that warrant attention and are the focus of this Plan. Issues can explore the range of conditions from significant problems requiring abatement or improvement to opportunities for enhancement.

- **Strategies**

Strategies respond to the items addressed in the Issues category. They are the recommendations for land use and physical improvement, provision of infrastructure and services, and development of neighborhood improvement programs.

- **Implementation Block**

The Implementation Block includes the following five sub-categories:

*Responsibility*

This category recommends the participation of the agencies, organizations or ad hoc groups that should be involved in the implementation of the strategies recommended in the particular Topic. Inclusion in this listing is based on areas of expertise, regulatory authority, ownership or business interest. This listing should be considered a guide; and as the implementation process for particular strategies evolves, additional or other more appropriate responsible parties may be identified. Community members and the Community Plan Implementation Team are always included in this category.

*Funding*

Most projects identified by the strategies in this Plan are unfunded. Except for a few cases where funds have been specifically identified, these recommendations identify potential funding sources and suggest funding strategies for Plan implementation. The potential sources may include a combination of City, other public agency and private funding sources.

*Schedule*

The implementation schedule shall be established by prioritization of all the plan strategies by the Community Plan Implementation Team and community members. Available or potential funding will be a consideration when establishing priorities. Except for projects or programs which are ongoing, or for which a schedule is identified, the recommendation is: "To be determined."

### *Land Use*

Indicates the planned land use, which is designated on the Community Land Use map, and provides recommendations for interim, future or alternative land uses. Also provided are listings of discretionary permits or other actions required in conjunction with the planned land use, and references to other guidelines or policy documents which provide direction for development of particular sites.

### *Zoning*

This category provides recommendations for future zoning, consistent with planned or future land uses, and identifies requirements or conditions for future application of recommended zones.

At the time this Plan was being prepared, the City of San Diego zoning code was being updated. Since new or revised citywide zone classifications were not adopted by the time this Plan was completed, proposed zoning was described by land use and development criteria rather than specifying a particular zone. Future rezonings should be based on selecting those zones that best match the prescribed criteria.

- **Guidelines**

Guidelines are provided in the Otay Valley Regional Park & Salt Ponds, Neighborhood Centers and Parks Topics. These Topics address anticipated or recommended physical site development. The guidelines may address land use, pedestrian and transit orientation, site planning, and architectural and landscape design associated with future project development.

- **Vicinity Maps**

Vicinity maps are provided in the geographically oriented Topics - the Otay Valley Regional Park & Salt Ponds, and Neighborhood Centers. They indicate the general Topic vicinity, which corresponds to the Topic areas shown on the Community Vision Map.

- **Reference Block**

Reference Blocks, located in the lower right corner of the first page of each Topic Sheet, refer the reader to related or supporting information located elsewhere in the Topic, in other related Topics, on the Community Vision map, or in the Appendix. References are not typically made within the Topic text.

## **3. APPENDIX**

The Appendix contains generic information or recommendations applicable to the entire community or this plan update process, and specific detailed information referred to in the Topic Sheets. A complete list of Appendices is provided in the Index.

### **III. TOPICS**

- 1 OTAY VALLEY REGIONAL PARK AND SALT PONDS**
- 2 NEIGHBORHOOD CENTERS**
- 3 HOUSING**
- 4 COMMUNITY FACILITIES**
- 5 PUBLIC SAFETY AND ENFORCEMENT**
- 6 TRANSPORTATION FACILITIES**

## TRANSPORTATION FACILITIES

---

## TOPIC 6 TRANSPORTATION FACILITIES

---

### VISION

*A safe, efficient, attractive, and environmentally sensitive transportation system consisting of vehicular, pedestrian, bicycle, and transit facilities will be provided to all who reside and conduct business in Otay Mesa-Nestor. Transportation improvement projects will enhance the community through the creative use of street lighting, public art, community signs and landscaping.*

### ISSUES

The community is served by a convenient grid-style street system, three accessible freeways, several bicycle routes and five bus routes which connect to the South Line Trolley. The San Diego Trolley is a regional light rail system that stops at two locations within the community.

Both Hollister Street south of Coronado Avenue, and Saturn Boulevard between Leon Avenue and Palm Avenue are not wide enough to accommodate projected traffic volumes. In addition, these streets have two below standard intersections; Saturn Boulevard at Palm Avenue, and Hollister Street at Coronado Avenue.

Over the course of the community's development, very little landscaping or streetscaping was designed into transportation projects. As a result, the community has only one half-mile of landscaped area along Del Sol Boulevard, thirty street trees along Palm Avenue, and a few street trees along Coronado Avenue.

Community members also report inadequate landscaping along the trolley right-of-way as compared to other jurisdictions. Other transit issues in the past have included bus service and conditions inferior to those elsewhere in the region. Although in recent years timed transfers have improved and newer buses have been added to the fleet, the community wants to ensure continued progress in this direction.

The bicycle system adopted in the 1979 Plan has never been completed. However, in response to regional goals to better recognize the aesthetic and cultural value of the San Diego Bay, efforts are underway to improve and finish various links of a regional bike system called the "Bayshore Bikeway." The Bayshore Bikeway currently takes bicyclists from Chula Vista, down along the Otay River Valley bike path, to the bike lane along Saturn Boulevard, then westwardly along the Palm Avenue bike lane to Imperial Beach.

## STRATEGIES

- Widen Hollister Street to a four-lane collector street between Coronado Avenue and Tocayo Avenue to accommodate the projected traffic for this roadway. Coordinate this project with Caltrans' plans for improving the Hollister Street and Coronado Avenue intersection by adding a southbound to eastbound left-turn lane, and a southbound to westbound right-turn lane.
- Widen Saturn Boulevard to a four-lane collector street from Leon Avenue to Palm Avenue to accommodate the projected traffic for this roadway. Coordinate this project with Caltrans' plans to add the following improvements to the Palm Avenue and Saturn Boulevard intersection:
  - 1) A westbound to southbound left-turn lane.
  - 2) An extension of the length of the westbound to northbound right-turn lane.
  - 3) An eastbound to southbound right-turn lane.
  - 4) A southbound to westbound right-turn lane.

(The segment of Saturn Boulevard between Palm Avenue and Coronado Avenue is included in the City's Capital Improvement Program and funding is scheduled for FY 1999.)

- Improve traffic flow along Palm Avenue, Coronado Avenue, Beyer Boulevard, Beyer Way, and Picador Boulevard by coordinating the traffic signals with the City's Master Traffic Control System.
- Monitor bus service and conditions to ensure appropriate service and facilities equal to those elsewhere in the City of San Diego.
- Utilize remaining Palm Avenue Improvement project funds to install community identification signs at both ends of Palm Avenue.
- Incorporate landscaping, street lights, unique community identification signs, and public art in transportation Capital Improvement Projects.

- Strategically place additional street lights in the community. Utilize thematic streetlights in unique areas such as Nestor Town Center.
- Provide additional landscaping within the Trolley right-of-way.
- Seek City Council approval for site-specific weight restrictions in residential areas to minimize tractor trailer traffic and parking impacts within the community.
- Complete the Bicycle System Plan as outlined in **Appendix 6**.
- Study alternative routes for the Bayshore Bikeway to bypass the auto traffic on Palm Avenue. Coordinate this effort with the Otay Valley Regional Park Planning efforts and with the SANDAG Bayshore Bikeway Project. (See **Topic 1, Otay Valley Regional Park and Salt Ponds** for additional discussion on the Bayshore Bikeway.)

#### RESPONSIBILITY

Community Plan Implementation Team, community members, City departments including Community and Economic Development Department, Engineering and Capital Projects, and Transportation, CalTrans and MTDB.

#### FUNDING

Capital Improvement Project, Transnet, CDBG, Non-profit sources.

#### SCHEDULE

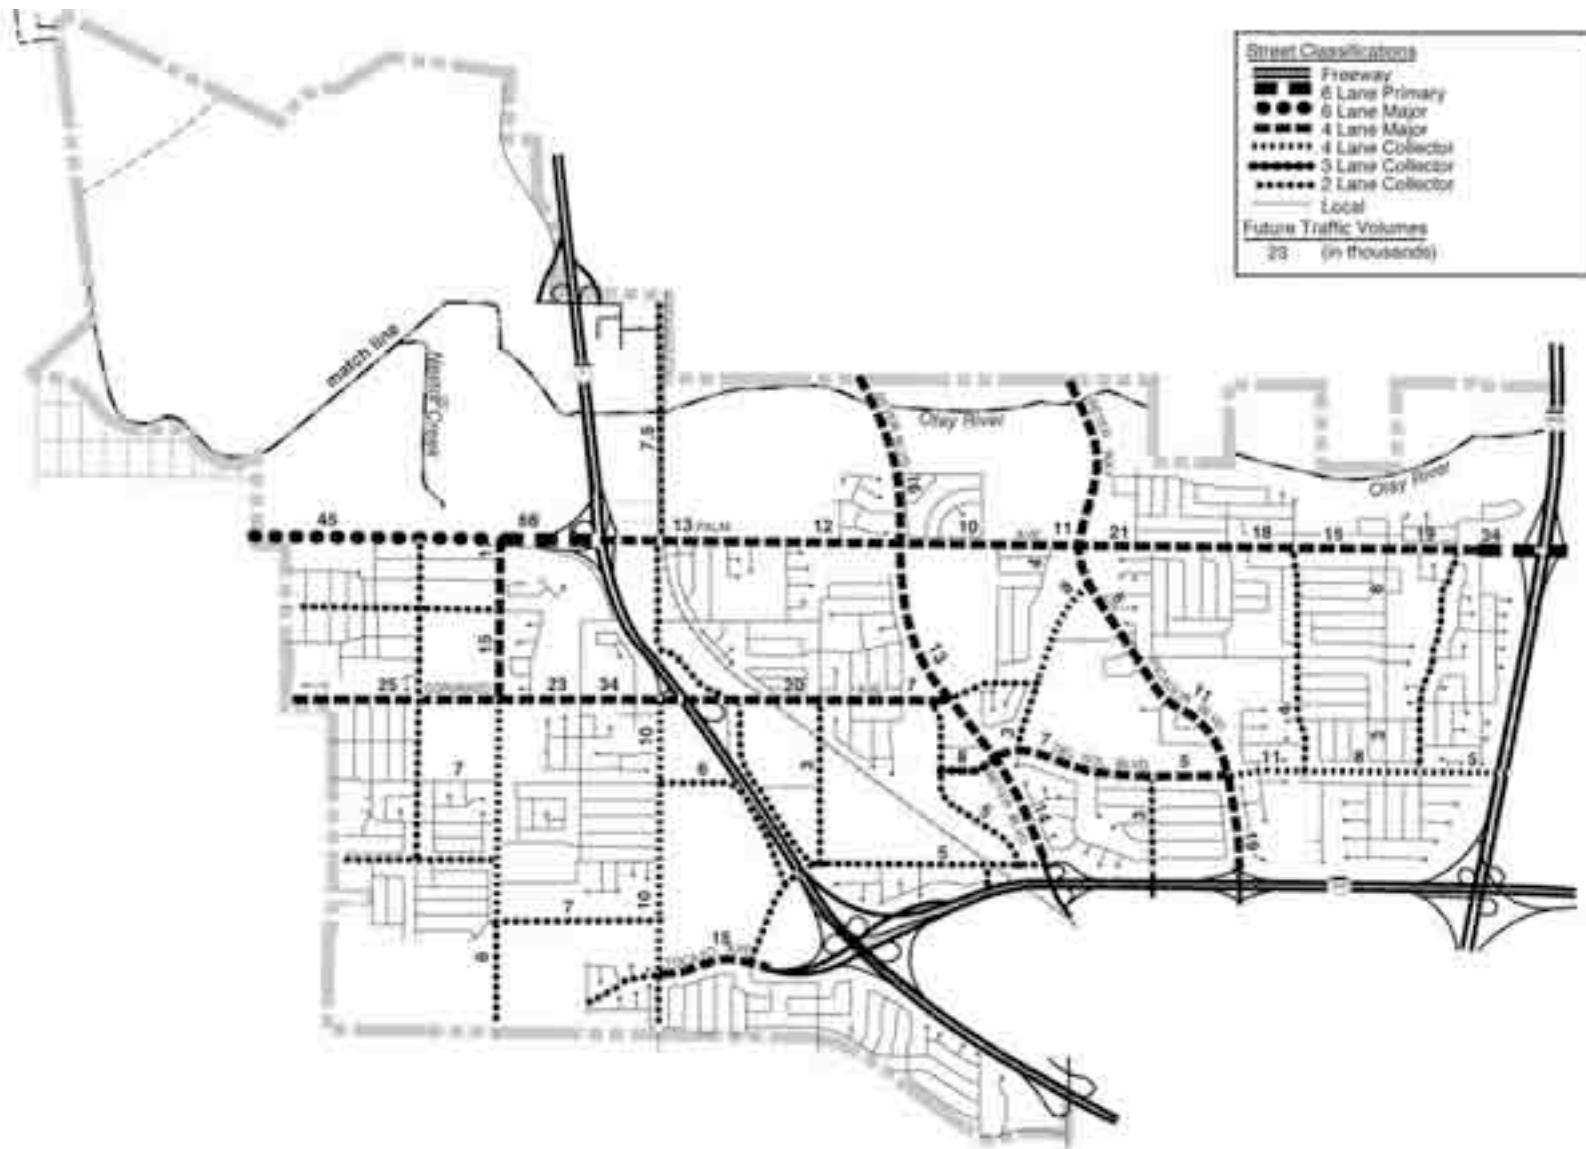

Hollister Street Improvement Project by year 2000. Improvements to Transit Plan beginning in 1996. Others to be determined.

---

#### Intersection Summary

|                    |      |
|--------------------|------|
| HCM 6th Ctrl Delay | 13.6 |
| HCM 6th LOS        | B    |

#### Notes

\* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

#### Intersection Summary

HCM 6th Ctrl Delay      14.3  
HCM 6th LOS              B

#### Notes

\* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

| Approach                                                                                                                              | 46  | 2.0 | 0.064        | 5.7   | LOS A         | 0.2   | 6.3            | 0.57           | 0.49             | 0.57  | 26.9                       |                |
| Roundabout LOS Method: Same as Sign Control.                                                                                          |     |     |              |       |               |       |                |                |                  |       |                            |                |
| Site Level of Service (LOS) Method: Delay & V/c (HCM 2010). Site LOS Method is specified in the Parameter Settings dialog (Site tab). |     |     |              |       |               |       |                |                |                  |       |                            |                |
| Vehicle movement LOS values are based on average delay and V/c ratio (degree of saturation) per movement.                             |     |     |              |       |               |       |                |                |                  |       |                            |                |
| LOS F will result if V/c > 1 irrespective of movement delay value (does not apply for approaches and intersections).                  |     |     |              |       |               |       |                |                |                  |       |                            |                |
| Intersections and Approaches LOS values are based on average delay for all movements (V/c not used as specified in HCM 2010).         |     |     |              |       |               |       |                |                |                  |       |                            |                |
| Roundabout Capacity Model: US HCM 6.                                                                                                  |     |     |              |       |               |       |                |                |                  |       |                            |                |
| HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.        |     |     |              |       |               |       |                |                |                  |       |                            |                |
| Gap-Accelerance Capacity: Traditional M1.                                                                                             |     |     |              |       |               |       |                |                |                  |       |                            |                |
| HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.                                         |     |     |              |       |               |       |                |                |                  |       |                            |                |

#### Intersection Summary

|                    |      |
|--------------------|------|
| HCM 6th Ctrl Delay | 37.8 |
| HCM 6th LOS        | D    |

#### Notes

Unsignalized Delay for [WBR] is excluded from calculations of the approach delay and intersection delay.

#### Intersection Summary

HCM 6th Ctrl Delay      14.1  
HCM 6th LOS              B

#### Notes

\* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if  $v/c > 1$  irrespective of movement delay (does not apply for approaches and intersections).

LOS E will result if  $v/c < 1$  irrespective of average delay value (does not apply for approaches and intersections).

Roundabout Capacity Model: US HCM 6.

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Gap-Accelerance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

#### Intersection Summary

HCM 6th Ctrl Delay      16.3  
HCM 6th LOS              B

#### Notes

\* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

#### Intersection Summary

HCM 6th Ctrl Delay                    174.7  
HCM 6th LOS                            F

#### Notes

Unsignalized Delay for [WBR] is excluded from calculations of the approach delay and intersection delay.

#### Intersection Summary

HCM 6th Ctrl Delay                    163.6  
HCM 6th LOS                            F

#### Notes

Unsignalized Delay for [WBR] is excluded from calculations of the approach delay and intersection delay.

#### Intersection Summary

HCM 6th Ctrl Delay                    35.9  
HCM 6th LOS                            D

#### Notes

\* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

#### Intersection Summary

HCM 6th Ctrl Delay                    163.6  
HCM 6th LOS                            F

#### Notes

Unsignalized Delay for [WBR] is excluded from calculations of the approach delay and intersection delay.

| 6   | Merge   | Basic    | I-5 NB Main On-Ramp                    | 1500       | 5     |

## Facility Segment Data

### Segment 1: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 5305             | 9600            | 0.55      | 74.1         | 17.9               | B   |

### Segment 2: Diverge

| Time Period | PHF  | fHV  | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS  |      |      |      |      |         |      |   |
|-------------|------|------|------------------|-----------------|-----------|--------------|--------------------|------|------|------|------|------|---------|------|---|
|             | F    | R    | F                | R               | Freeway   | Ramp         | Freeway            | Ramp | F    | R    | F    | R    | Freeway | Ramp |   |
| 1           | 1.00 | 1.00 | 0.962            | 0.980           | 5305      | 922          | 9600               | 2000 | 0.55 | 0.46 | 67.3 | 58.3 | 19.7    | 27.4 | C |

### Segment 3: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 4365             | 9600            | 0.45      | 75.1         | 14.5               | B   |

### Segment 4: Weaving

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 5450             | 9562            | 0.57      | 60.2         | 18.1               | B   |

### Segment 5: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 5006             | 9600            | 0.52      | 74.6         | 16.8               | B   |

### Segment 6: Merge

| Time Period | PHF  |      | fHV   |       | Flow Rate (pc/h) |      | Capacity (pc/h) |      | d/c Ratio |      | Speed (mi/h) |      | Density (pc/mi/ln) |      | LOS |
|-------------|------|------|-------|-------|------------------|------|-----------------|------|-----------|------|--------------|------|--------------------|------|-----|
|             | F    | R    | F     | R     | Freeway          | Ramp | Freeway         | Ramp | F         | R    | F            | R    | Freeway            | Ramp |     |
| 1           | 1.00 | 1.00 | 0.962 | 0.980 | 5442             | 436  | 12000           | 2000 | 0.45      | 0.22 | 75.3         | 75.3 | 14.5               | 14.5 | B   |

### Facility Time Period Results

| T | Speed, mi/h | Density, pc/mi/ln | Density, veh/mi/ln | Travel Time, min | LOS |
|---|-------------|-------------------|--------------------|------------------|-----|
| 1 | 68.2        | 16.8              | 16.1               | 1.70             | B   |

### Facility Overall Results

|                          |      |                    |      |
|--------------------------|------|--------------------|------|
| Space Mean Speed, mi/h   | 68.2 | Density, veh/mi/ln | 16.1 |
| Average Travel Time, min | 1.70 | Density, pc/mi/ln  | 16.8 |

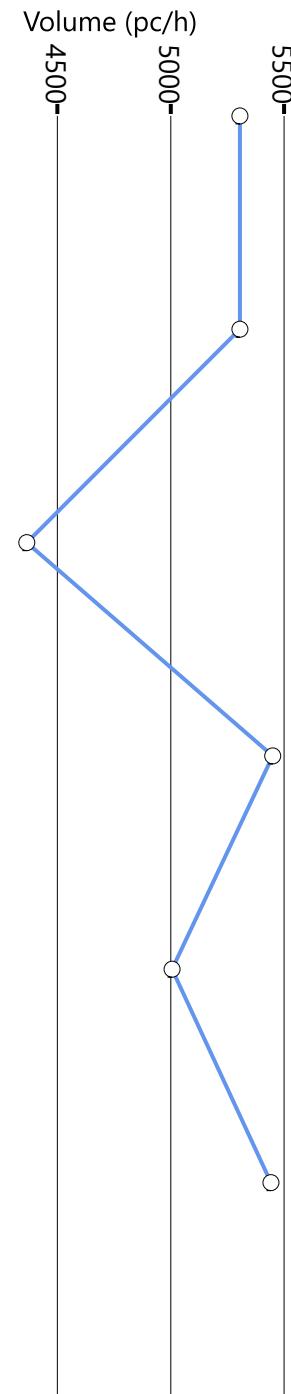

### Messages

|           |                                                                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WARNING 1 | Beginning and ending the facility with a basic freeway segment is highly recommended. Use caution when interpreting results of a Freeway Facility without a basic segment bounding the beginning and end of the facility. |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Facility Segment Data

### Segment 1: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 3505             | 12000           | 0.29      | 75.4         | 9.3                | A   |
| 2           | 1.00 | 0.962 | 9055             | 12000           | 0.75      | 67.9         | 26.7               | D   |

### Segment 2: Diverge

| Time Period | PHF  |      | fHV   |       | Flow Rate (pc/h) |      | Capacity (pc/h) |      | d/c Ratio |      | Speed (mi/h) |      | Density (pc/mi/ln) |      | LOS |
|-------------|------|------|-------|-------|------------------|------|-----------------|------|-----------|------|--------------|------|--------------------|------|-----|
|             | F    | R    | F     | R     | Freeway          | Ramp | Freeway         | Ramp | F         | R    | F            | R    | Freeway            | Ramp |     |
| 1           | 1.00 | 1.00 | 0.962 | 0.980 | 3505             | 562  | 12000           | 2000 | 0.29      | 0.28 | 75.4         | 75.4 | 9.3                | 9.3  | A   |
| 2           | 1.00 | 1.00 | 0.962 | 0.980 | 8847             | 653  | 12000           | 2000 | 0.75      | 0.33 | 68.0         | 68.0 | 26.0               | 26.0 | C   |

### Segment 3: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 2932             | 9600            | 0.31      | 75.4         | 9.7                | A   |
| 2           | 1.00 | 0.962 | 8008             | 9600            | 0.87      | 32.9         | 60.9               | F   |

### Segment 4: Weaving

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 3207             | 5369            | 0.60      | 60.1         | 10.7               | B   |
| 2           | 1.00 | 0.962 | 8216             | 8823            | 1.02      | 53.8         | 30.5               | F   |

### Segment 5: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 1811             | 9600            | 0.19      | 74.4         | 6.0                | A   |
| 2           | 1.00 | 0.962 | 6258             | 9600            | 0.72      | 71.7         | 21.8               | C   |

### Segment 6: Merge

| Time Period | PHF  |      | fHV   |       | Flow Rate (pc/h) |      | Capacity (pc/h) |      | d/c Ratio |      | Speed (mi/h) |      | Density (pc/mi/ln) |      | LOS |
|-------------|------|------|-------|-------|------------------|------|-----------------|------|-----------|------|--------------|------|--------------------|------|-----|
|             | F    | R    | F     | R     | Freeway          | Ramp | Freeway         | Ramp | F         | R    | F            | R    | Freeway            | Ramp |     |
| 1           | 1.00 | 1.00 | 0.962 | 0.980 | 1932             | 121  | 12000           | 2000 | 0.16      | 0.06 | 75.2         | 75.4 | 5.1                | 5.1  | A   |
| 2           | 1.00 | 1.00 | 0.962 | 0.980 | 6378             | 120  | 12000           | 2000 | 0.59      | 0.06 | 69.3         | 69.3 | 18.4               | 18.4 | C   |

### Segment 7: Merge

| Time Period | PHF  |      | fHV   |       | Flow Rate (pc/h) |      | Capacity (pc/h) |      | d/c Ratio |      | Speed (mi/h) |      | Density (pc/mi/ln) |      | LOS |
|-------------|------|------|-------|-------|------------------|------|-----------------|------|-----------|------|--------------|------|--------------------|------|-----|
|             | F    | R    | F     | R     | Freeway          | Ramp | Freeway         | Ramp | F         | R    | F            | R    | Freeway            | Ramp |     |
| 1           | 1.00 | 1.00 | 0.962 | 0.980 | 2067             | 132  | 12000           | 2000 | 0.17      | 0.07 | 70.5         | 66.2 | 5.9                | 6.9  | A   |
| 2           | 1.00 | 1.00 | 0.962 | 0.980 | 6583             | 495  | 12000           | 2000 | 0.63      | 0.25 | 68.8         | 65.2 | 19.1               | 18.6 | B   |

### Facility Time Period Results

| T | Speed, mi/h | Density, pc/mi/ln | Density, veh/mi/ln | Travel Time, min | LOS |
|---|-------------|-------------------|--------------------|------------------|-----|
| 1 | 70.1        | 8.6               | 8.3                | 1.30             | A   |
| 2 | 52.0        | 32.2              | 31.0               | 1.70             | F   |

### Facility Overall Results

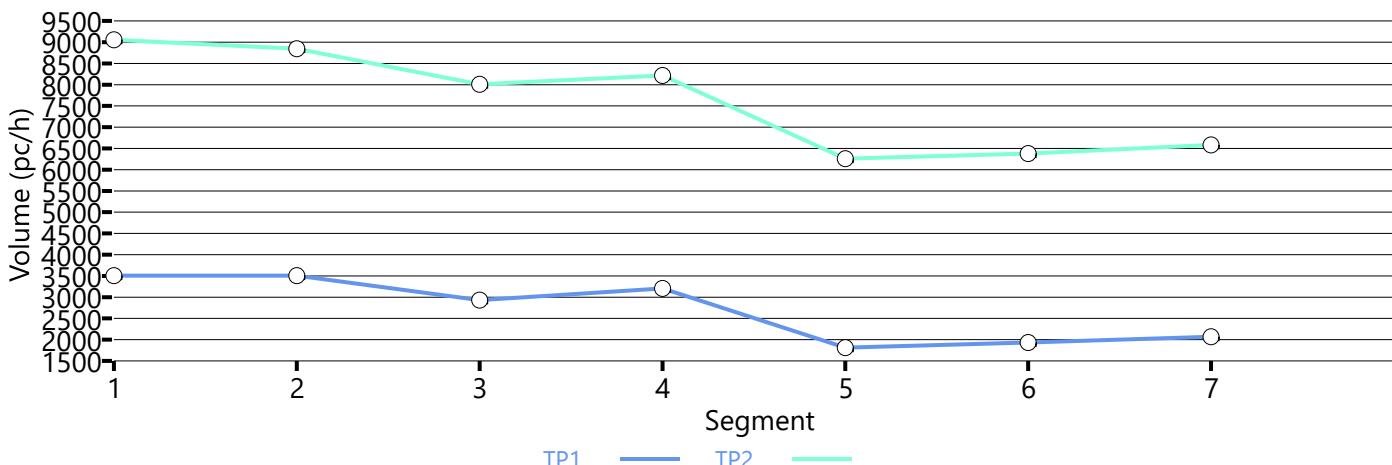

|                          |      |                    |      |
|--------------------------|------|--------------------|------|
| Space Mean Speed, mi/h   | 55.9 | Density, veh/mi/ln | 19.6 |
| Average Travel Time, min | 1.60 | Density, pc/mi/ln  | 20.4 |

|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ERROR 1   | Acceleration lane length is longer than the segment length for merge segment 6.                                                                                                                                             |
| ERROR 2   | Acceleration lane length is longer than the segment length for merge segment 7.                                                                                                                                             |
| WARNING 1 | Oversaturated conditions currently exist in boundary time period 2. Results may not be reliable. Consider expanding analysis in time and/or space to resolve this warning.                                                  |
| WARNING 2 | Oversaturated conditions currently exist on segment 1, which is less than 300 feet. Due to time step size, these segments may produce unreliable results. Consider reviewing facility segmentation to resolve this warning. |
| WARNING 3 | Beginning and ending the facility with a basic freeway segment is highly recommended. Use caution when interpreting results of a Freeway Facility without a basic segment bounding the beginning and end of the facility.   |

## Facility Segment Data

### Segment 1: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 7128             | 9600            | 0.74      | 68.4         | 26.1               | D   |

### Segment 2: Diverge

| Time Period | PHF  | fHV  | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS  |      |      |      |      |         |      |   |
|-------------|------|------|------------------|-----------------|-----------|--------------|--------------------|------|------|------|------|------|---------|------|---|
|             | F    | R    | F                | R               | Freeway   | Ramp         | Freeway            | Ramp | F    | R    | F    | R    | Freeway | Ramp |   |
| 1           | 1.00 | 1.00 | 0.962            | 0.980           | 7128      | 1303         | 9600               | 2000 | 0.74 | 0.65 | 65.9 | 57.2 | 27.0    | 36.0 | E |

### Segment 3: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 5800             | 9600            | 0.60      | 73.0         | 19.9               | C   |

### Segment 4: Weaving

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 7059             | 10435           | 0.68      | 56.7         | 24.9               | C   |

### Segment 5: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 6524             | 9600            | 0.68      | 70.8         | 23.0               | C   |

### Segment 6: Merge

| Time Period | PHF  |      | fHV   |       | Flow Rate (pc/h) |      | Capacity (pc/h) |      | d/c Ratio |      | Speed (mi/h) |      | Density (pc/mi/ln) |      | LOS |
|-------------|------|------|-------|-------|------------------|------|-----------------|------|-----------|------|--------------|------|--------------------|------|-----|
|             | F    | R    | F     | R     | Freeway          | Ramp | Freeway         | Ramp | F         | R    | F            | R    | Freeway            | Ramp |     |
| 1           | 1.00 | 1.00 | 0.962 | 0.980 | 7039             | 515  | 12000           | 2000 | 0.59      | 0.26 | 73.4         | 73.4 | 19.2               | 19.2 | C   |

### Facility Time Period Results

| T | Speed, mi/h | Density, pc/mi/ln | Density, veh/mi/ln | Travel Time, min | LOS |
|---|-------------|-------------------|--------------------|------------------|-----|
| 1 | 65.4        | 22.9              | 22.1               | 1.70             | C   |

### Facility Overall Results

|                          |      |                    |      |
|--------------------------|------|--------------------|------|
| Space Mean Speed, mi/h   | 65.4 | Density, veh/mi/ln | 22.1 |
| Average Travel Time, min | 1.70 | Density, pc/mi/ln  | 22.9 |

|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ERROR 1   | Acceleration lane length is longer than the segment length for merge segment 6.                                                                                                                                           |
| ERROR 2   | Acceleration lane length is longer than the segment length for merge segment 7.                                                                                                                                           |
| WARNING 1 | Beginning and ending the facility with a basic freeway segment is highly recommended. Use caution when interpreting results of a Freeway Facility without a basic segment bounding the beginning and end of the facility. |

|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ERROR 1   | Acceleration lane length is longer than the segment length for merge segment 6.                                                                                                                                             |
| ERROR 2   | Acceleration lane length is longer than the segment length for merge segment 7.                                                                                                                                             |
| WARNING 1 | Oversaturated conditions currently exist in boundary time period 1. Results may not be reliable. Consider expanding analysis in time and/or space to resolve this warning.                                                  |
| WARNING 2 | Oversaturated conditions currently exist on segment 1, which is less than 300 feet. Due to time step size, these segments may produce unreliable results. Consider reviewing facility segmentation to resolve this warning. |
| WARNING 3 | Beginning and ending the facility with a basic freeway segment is highly recommended. Use caution when interpreting results of a Freeway Facility without a basic segment bounding the beginning and end of the facility.   |
| WARNING 4 | Queue extends past the beginning of the facility on time period 1. Consider expanding the length of the facility to account for these vehicles performance and affect on upstream segments.                                 |

## Facility Segment Data

### Segment 1: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 7128             | 9600            | 0.74      | 68.4         | 26.1               | D   |

### Segment 2: Diverge

| Time Period | PHF  | fHV  | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS  |      |      |      |      |         |      |   |
|-------------|------|------|------------------|-----------------|-----------|--------------|--------------------|------|------|------|------|------|---------|------|---|
|             | F    | R    | F                | R               | Freeway   | Ramp         | Freeway            | Ramp | F    | R    | F    | R    | Freeway | Ramp |   |
| 1           | 1.00 | 1.00 | 0.962            | 0.980           | 7128      | 1303         | 9600               | 2000 | 0.74 | 0.65 | 65.9 | 57.2 | 27.0    | 36.0 | E |

### Segment 3: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 5800             | 9600            | 0.60      | 73.0         | 19.9               | C   |

### Segment 4: Weaving

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 7059             | 10435           | 0.68      | 56.7         | 24.9               | C   |

### Segment 5: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 6524             | 9600            | 0.68      | 70.8         | 23.0               | C   |

### Segment 6: Merge

| Time Period | PHF  | fHV  | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS  |      |      |         |      |      |      |   |
|-------------|------|------|------------------|-----------------|-----------|--------------|--------------------|------|------|------|---------|------|------|------|---|
|             | F    | R    | F                | Ramp            | Freeway   | Ramp         | F                  | R    | F    | R    | Freeway | Ramp |      |      |   |
| 1           | 1.00 | 1.00 | 0.962            | 0.980           | 7185      | 661          | 12000              | 2000 | 0.60 | 0.33 | 73.1    | 73.1 | 19.7 | 19.7 | C |

### Facility Time Period Results

| T | Speed, mi/h | Density, pc/mi/ln | Density, veh/mi/ln | Travel Time, min | LOS |
|---|-------------|-------------------|--------------------|------------------|-----|
| 1 | 65.4        | 23.0              | 22.1               | 1.70             | C   |

### Facility Overall Results

## Facility Segment Data

### Segment 1: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 4360             | 12000           | 0.36      | 75.4         | 11.6               | B   |

### Segment 2: Diverge

| Time Period | PHF  | fHV  | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS  |      |      |      |      |         |      |   |
|-------------|------|------|------------------|-----------------|-----------|--------------|--------------------|------|------|------|------|------|---------|------|---|
|             | F    | R    | F                | R               | Freeway   | Ramp         | Freeway            | Ramp | F    | R    | F    | R    | Freeway | Ramp |   |
| 1           | 1.00 | 1.00 | 0.962            | 0.980           | 4360      | 972          | 12000              | 2000 | 0.36 | 0.49 | 75.4 | 75.4 | 11.6    | 11.6 | B |

### Segment 3: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 3369             | 9600            | 0.35      | 75.4         | 11.2               | B   |

### Segment 4: Weaving

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 3679             | 5195            | 0.71      | 58.1         | 12.7               | B   |

### Segment 5: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 2010             | 9600            | 0.21      | 74.2         | 6.7                | A   |

### Segment 6: Merge

| Time Period | PHF  |      | fHV   |       | Flow Rate (pc/h) |      | Capacity (pc/h) |      | d/c Ratio |      | Speed (mi/h) |      | Density (pc/mi/ln) |      | LOS |
|-------------|------|------|-------|-------|------------------|------|-----------------|------|-----------|------|--------------|------|--------------------|------|-----|
|             | F    | R    | F     | R     | Freeway          | Ramp | Freeway         | Ramp | F         | R    | F            | R    | Freeway            | Ramp |     |
| 1           | 1.00 | 1.00 | 0.962 | 0.980 | 2147             | 137  | 12000           | 2000 | 0.18      | 0.07 | 75.2         | 75.4 | 5.7                | 5.7  | A   |

### Segment 7: Merge

| Time Period | PHF  |      | fHV   |       | Flow Rate (pc/h) |      | Capacity (pc/h) |      | d/c Ratio |      | Speed (mi/h) |      | Density (pc/mi/ln) |      | LOS |
|-------------|------|------|-------|-------|------------------|------|-----------------|------|-----------|------|--------------|------|--------------------|------|-----|
|             | F    | R    | F     | R     | Freeway          | Ramp | Freeway         | Ramp | F         | R    | F            | R    | Freeway            | Ramp |     |
| 1           | 1.00 | 1.00 | 0.962 | 0.980 | 2310             | 160  | 12000           | 2000 | 0.19      | 0.08 | 70.5         | 66.2 | 6.6                | 7.6  | A   |

### Facility Time Period Results

| T | Speed, mi/h | Density, pc/mi/ln | Density, veh/mi/ln | Travel Time, min | LOS |
|---|-------------|-------------------|--------------------|------------------|-----|
| 1 | 69.4        | 10.1              | 9.8                | 1.30             | A   |

### Facility Overall Results

|                          |      |                    |      |
|--------------------------|------|--------------------|------|
| Space Mean Speed, mi/h   | 69.4 | Density, veh/mi/ln | 9.8  |

|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ERROR 1   | Acceleration lane length is longer than the segment length for merge segment 6.                                                                                                                                             |
| ERROR 2   | Acceleration lane length is longer than the segment length for merge segment 7.                                                                                                                                             |
| WARNING 1 | Oversaturated conditions currently exist in boundary time period 1. Results may not be reliable. Consider expanding analysis in time and/or space to resolve this warning.                                                  |
| WARNING 2 | Oversaturated conditions currently exist on segment 1, which is less than 300 feet. Due to time step size, these segments may produce unreliable results. Consider reviewing facility segmentation to resolve this warning. |
| WARNING 3 | Beginning and ending the facility with a basic freeway segment is highly recommended. Use caution when interpreting results of a Freeway Facility without a basic segment bounding the beginning and end of the facility.   |
| WARNING 4 | Queue extends past the beginning of the facility on time period 1. Consider expanding the length of the facility to account for these vehicles performance and affect on upstream segments.                                 |

| Agency              | Caltrans    | Analysis Year        | Horizon Year WP NB      |
| Jurisdiction        |             | Time Period Analyzed | AM Peak                 |
| Project Description | Bella Mar   | Unit                 | United States Customary |

## Facility Global Input

|                                  |       |                               |      |
|----------------------------------|-------|-------------------------------|------|
| Jam Density, pc/mi/ln            | 190.0 | Density at Capacity, pc/mi/ln | 45.0 |
| Queue Discharge Capacity Drop, % | 7     | Total Segments                | 6    |
| Total Time Periods               | 1     | Time Period Duration, min     | 15   |
| Facility Length, mi              | 1.89  |                               |      |

## Facility Segment Data

| No. | Coded   | Analyzed | Name                                   | Length, ft | Lanes |
|-----|---------|----------|----------------------------------------|------------|-------|
| 1   | Basic   | Basic    | I-5 NB South of Palm                   | 100        | 4     |
| 2   | Diverge | Diverge  | I-5 NB Palm Off-Ramp                   | 1500       | 4     |
| 3   | Basic   | Basic    | I-5 NB between Palm Off-Ramp & On-Ramp | 2455       | 4     |
| 4   | Weaving | Weaving  | I-5 NB Palm On-Ramp to Main Off-Ramp   | 3110       | 5     |
| 5   | Basic   | Basic    | I-5 NB between Main Off-Ramp & On-Ramp | 1330       | 4     |
| 6   | Merge   | Basic    | I-5 NB Main On-Ramp                    | 1500       | 5     |

## Facility Segment Data

### Segment 1: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 7128             | 9600            | 0.74      | 68.4         | 26.1               | D   |

### Segment 2: Diverge

| Time Period | PHF  | fHV  | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS  |      |      |      |      |         |      |   |
|-------------|------|------|------------------|-----------------|-----------|--------------|--------------------|------|------|------|------|------|---------|------|---|
|             | F    | R    | F                | R               | Freeway   | Ramp         | Freeway            | Ramp | F    | R    | F    | R    | Freeway | Ramp |   |
| 1           | 1.00 | 1.00 | 0.962            | 0.980           | 7128      | 1303         | 9600               | 2000 | 0.74 | 0.65 | 65.9 | 57.2 | 27.0    | 36.0 | E |

### Segment 3: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 5800             | 9600            | 0.60      | 73.0         | 19.9               | C   |

### Segment 4: Weaving

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 7059             | 10435           | 0.68      | 56.7         | 24.9               | C   |

### Segment 5: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 6524             | 9600            | 0.68      | 70.8         | 23.0               | C   |

### Segment 6: Merge

| Time Period | PHF  |      | fHV   |       | Flow Rate (pc/h) |      | Capacity (pc/h) |      | d/c Ratio |      | Speed (mi/h) |      | Density (pc/mi/ln) |      | LOS |
|-------------|------|------|-------|-------|------------------|------|-----------------|------|-----------|------|--------------|------|--------------------|------|-----|
|             | F    | R    | F     | R     | Freeway          | Ramp | Freeway         | Ramp | F         | R    | F            | R    | Freeway            | Ramp |     |
| 1           | 1.00 | 1.00 | 0.962 | 0.980 | 7236             | 712  | 12000           | 2000 | 0.60      | 0.36 | 73.0         | 73.0 | 19.8               | 19.8 | C   |

### Facility Time Period Results

| T | Speed, mi/h | Density, pc/mi/ln | Density, veh/mi/ln | Travel Time, min | LOS |
|---|-------------|-------------------|--------------------|------------------|-----|
| 1 | 65.4        | 23.0              | 22.1               | 1.70             | C   |

### Facility Overall Results

|                          |      |                    |      |
|--------------------------|------|--------------------|------|
| Space Mean Speed, mi/h   | 65.4 | Density, veh/mi/ln | 22.1 |
| Average Travel Time, min | 1.70 | Density, pc/mi/ln  | 23.0 |

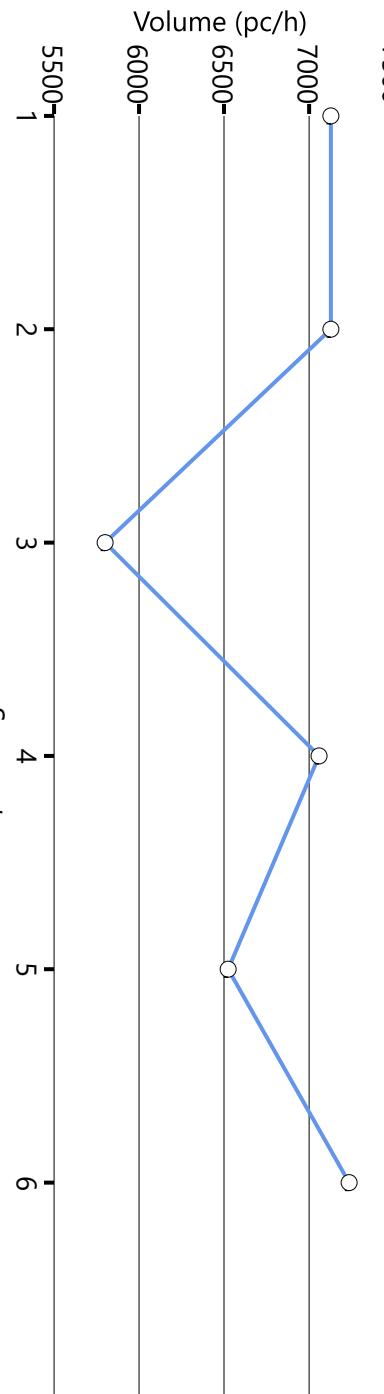

### Messages

|           |                                                                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WARNING 1 | Beginning and ending the facility with a basic freeway segment is highly recommended. Use caution when interpreting results of a Freeway Facility without a basic segment bounding the beginning and end of the facility. |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Facility Segment Data

### Segment 1: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 5930             | 9600            | 0.62      | 72.7         | 20.4               | C   |

### Segment 2: Diverge

| Time Period | PHF  | fHV  | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS  |      |      |      |      |         |      |   |
|-------------|------|------|------------------|-----------------|-----------|--------------|--------------------|------|------|------|------|------|---------|------|---|
|             | F    | R    | F                | R               | Freeway   | Ramp         | Freeway            | Ramp | F    | R    | F    | R    | Freeway | Ramp |   |
| 1           | 1.00 | 1.00 | 0.962            | 0.980           | 5930      | 874          | 9600               | 2000 | 0.62 | 0.44 | 67.6 | 58.5 | 21.9    | 29.5 | D |

### Segment 3: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 5040             | 9600            | 0.53      | 74.6         | 16.9               | B   |

### Segment 4: Weaving

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 6024             | 10762           | 0.56      | 59.6         | 20.2               | C   |

### Segment 5: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 5514             | 9600            | 0.57      | 73.7         | 18.7               | C   |

### Segment 6: Merge

| Time Period | PHF  | fHV  | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS  |      |      |         |      |      |      |   |
|-------------|------|------|------------------|-----------------|-----------|--------------|--------------------|------|------|------|---------|------|------|------|---|
|             | F    | R    | F                | Ramp            | Freeway   | Ramp         | F                  | R    | F    | R    | Freeway | Ramp |      |      |   |
| 1           | 1.00 | 1.00 | 0.962            | 0.980           | 6543      | 1029         | 12000              | 2000 | 0.55 | 0.51 | 74.2    | 74.2 | 17.6 | 17.6 | B |

### Facility Time Period Results

| T | Speed, mi/h | Density, pc/mi/ln | Density, veh/mi/ln | Travel Time, min | LOS |
|---|-------------|-------------------|--------------------|------------------|-----|
| 1 | 67.8        | 19.1              | 18.4               | 1.70             | C   |

### Facility Overall Results

|                          |      |                    |      |
|--------------------------|------|--------------------|------|
| Space Mean Speed, mi/h   | 67.8 | Density, veh/mi/ln | 18.4 |
| Average Travel Time, min | 1.70 | Density, pc/mi/ln  | 19.1 |

## Facility Segment Data

### Segment 1: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/ln) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 9247             | 12000           | 0.87      | 23.6         | 78.3               | F   |

### Segment 2: Diverge

| Time Period | PHF  |      | fHV   |       | Flow Rate (pc/h) |      | Capacity (pc/h) |      | d/c Ratio |      | Speed (mi/h) |      | Density (pc/mi/ln) |      | LOS |
|-------------|------|------|-------|-------|------------------|------|-----------------|------|-----------|------|--------------|------|--------------------|------|-----|
|             | F    | R    | F     | R     | Freeway          | Ramp | Freeway         | Ramp | F         | R    | F            | R    | Freeway            | Ramp |     |
| 1           | 1.00 | 1.00 | 0.962 | 0.980 | 8964             | 880  | 12000           | 2000 | 0.87      | 0.44 | 23.9         | 23.9 | 75.1               | 75.1 | F   |

### Segment 3: Basic

| Time Period | PHF  |      | fHV   |       | Flow Rate (pc/h) |      | Capacity (pc/h) |      | d/c Ratio |   | Speed (mi/h) |   | Density (pc/mi/ln) |      | LOS |
|-------------|------|------|-------|-------|------------------|------|-----------------|------|-----------|---|--------------|---|--------------------|------|-----|
|             | F    | R    | F     | R     | Freeway          | Ramp | Freeway         | Ramp | F         | R | F            | R | Freeway            | Ramp |     |
| 1           | 1.00 | 1.00 | 0.962 | 0.980 | 7948             |      | 9600            |      | 0.99      |   | 28.8         |   | 69.1               |      | F   |

### Segment 4: Weaving

| Time Period | PHF  |      | fHV   |       | Flow Rate (pc/h) |      | Capacity (pc/h) |      | d/c Ratio |   | Speed (mi/h) |   | Density (pc/mi/ln) |      | LOS |
|-------------|------|------|-------|-------|------------------|------|-----------------|------|-----------|---|--------------|---|--------------------|------|-----|
|             | F    | R    | F     | R     | Freeway          | Ramp | Freeway         | Ramp | F         | R | F            | R | Freeway            | Ramp |     |
| 1           | 1.00 | 1.00 | 0.962 | 0.980 | 8156             |      | 8759            |      | 1.16      |   | 53.3         |   | 30.6               |      | F   |

### Segment 5: Basic

| Time Period | PHF  | fHV   | Flow Rate (pc/h) | Capacity (pc/h) | d/c Ratio | Speed (mi/h) | Density (pc/mi/in) | LOS |
|-------------|------|-------|------------------|-----------------|-----------|--------------|--------------------|-----|
| 1           | 1.00 | 0.962 | 5670             | 9600            | 0.81      | 73.3         | 19.3               | C   |

### Segment 6: Merge

| Time Period | PHF  |      | fHV   |       | Flow Rate (pc/h) |      | Capacity (pc/h) |      | d/c Ratio |      | Speed (mi/h) |      | Density (pc/mi/in) |      | LOS |
|-------------|------|------|-------|-------|------------------|------|-----------------|------|-----------|------|--------------|------|--------------------|------|-----|
|             | F    | R    | F     | R     | Freeway          | Ramp | Freeway         | Ramp | F         | R    | F            | R    | Freeway            | Ramp |     |
| 1           | 1.00 | 1.00 | 0.962 | 0.980 | 5817             | 147  | 12000           | 2000 | 0.66      | 0.07 | 69.5         | 69.5 | 16.7               | 16.7 | B   |

### Segment 7: Merge

| Time Period | PHF  |      | fHV   |       | Flow Rate (pc/h) |      | Capacity (pc/h) |      | d/c Ratio |      | Speed (mi/h) |      | Density (pc/mi/in) |      | LOS |
|-------------|------|------|-------|-------|------------------|------|-----------------|------|-----------|------|--------------|------|--------------------|------|-----|
|             | F    | R    | F     | R     | Freeway          | Ramp | Freeway         | Ramp | F         | R    | F            | R    | Freeway            | Ramp |     |
| 1           | 1.00 | 1.00 | 0.962 | 0.980 | 6024             | 611  | 12000           | 2000 | 0.71      | 0.31 | 68.9         | 65.2 | 17.5               | 18.2 | B   |

### Facility Time Period Results

| T | Speed, mi/h | Density, pc/mi/in | Density, veh/mi/in | Travel Time, min | LOS |
|---|-------------|-------------------|--------------------|------------------|-----|
| 1 | 37.0        | 44.1              | 42.5               | 2.40             | F   |

### Facility Overall Results

|                          |      |                    |      |
|--------------------------|------|--------------------|------|
| Space Mean Speed, mi/h   | 37.0 | Density, veh/mi/in | 42.5 |
| Average Travel Time, min | 2.40 | Density, pc/mi/in  | 44.1 |

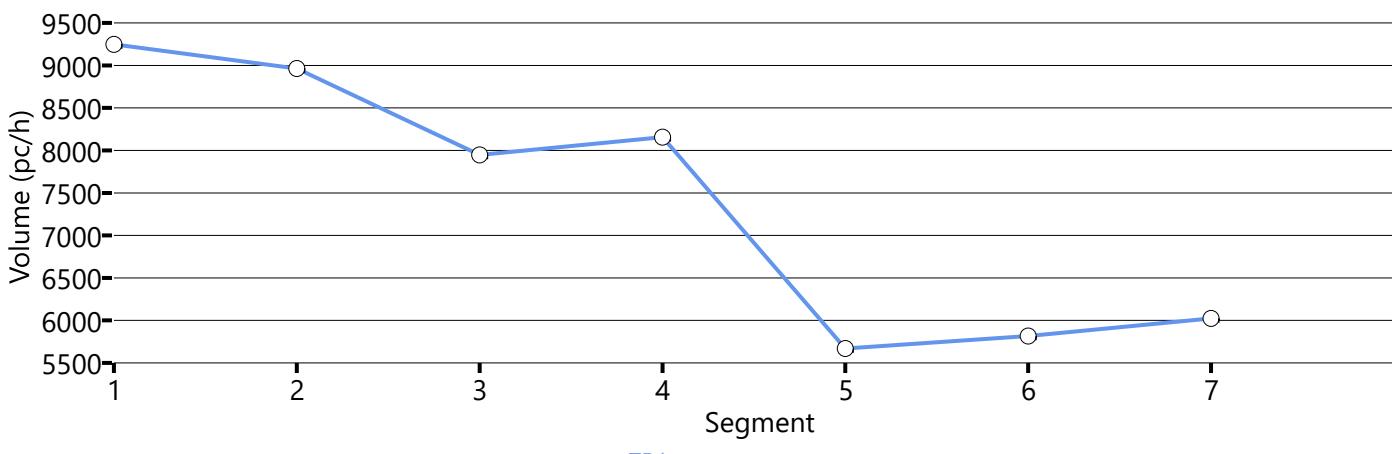

### Messages

|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ERROR 1   | Acceleration lane length is longer than the segment length for merge segment 6.                                                                                                                                             |
| ERROR 2   | Acceleration lane length is longer than the segment length for merge segment 7.                                                                                                                                             |
| WARNING 1 | Oversaturated conditions currently exist in boundary time period 1. Results may not be reliable. Consider expanding analysis in time and/or space to resolve this warning.                                                  |
| WARNING 2 | Oversaturated conditions currently exist on segment 1, which is less than 300 feet. Due to time step size, these segments may produce unreliable results. Consider reviewing facility segmentation to resolve this warning. |
| WARNING 3 | Beginning and ending the facility with a basic freeway segment is highly recommended. Use caution when interpreting results of a Freeway Facility without a basic segment bounding the beginning and end of the facility.   |
| WARNING 4 | Queue extends past the beginning of the facility on time period 1. Consider expanding the length of the facility to account for these vehicles performance and affect on upstream segments.                                 |

# EXECUTIVE SUMMARY

The City of San Diego's Pedestrian Crosswalk Guidelines seeks to improve pedestrian safety with enhanced street crossings. These guidelines serve to accomplish the following safety improvements for pedestrians in the City of San Diego:

- More pedestrian crossings will qualify for marked crosswalks.
- More marked crosswalks will have features like traffic calming or flashing beacons.

The California Vehicle Code specifies that crosswalks can be either unmarked or marked. The Pedestrian Crosswalk Guidelines provides a systematic approach to evaluate pedestrian crossing locations for the installation of marked crosswalks and additional pedestrian safety treatments. The creation of a pedestrian risk model assisted in the development of the uncontrolled crosswalk warrant system, crossing treatment thresholds, and crossing treatment categories, presented in Chapter 2.

## Pedestrian Risk Model

A pedestrian risk model was developed to assess built environment and behavioral factors thought to influence a pedestrian's risk while crossing roadways. The model used 14 years of pedestrian-related collision data (1999 – 2012) from the City of San Diego, representing over 7,000 total pedestrian-related collisions.

The model identified variables with a statistically significant relationship to pedestrian risk. The following variables are associated with increased pedestrian risk: ADT, posted speed limit, crosswalk condition, marked crosswalks, and locations where pedestrian crossing is restricted but evidence shows pedestrians are illegally crossing. Variables associated with decreased pedestrian risk include the following: the presence of pedestrian warning signage, the presence of pedestrian signal heads, population levels, and employment levels.

## Uncontrolled Crosswalk Warrant and Implementation

The uncontrolled crosswalk warrant recommendations provide guidance for evaluating uncontrolled locations for the installation of marked crosswalks and additional pedestrian safety treatments. This warrant system builds on the previous warrant system in the 1990 Council Policy 200-07, and was developed using results from the pedestrian risk model. Similar to the existing warrant system, the recommended system contains both Basic Warrants and Point Warrants.

A proposed location must satisfy each of the Basic Warrants and score a minimum of 16 points out of 38 possible points in the Point Warrant system to qualify for a marked crosswalk. Under the previous Point Warrant system, a location needed to score a minimum of 16 points out of 34 possible. In addition, the "Pedestrian Volume Warrant" threshold was reduced; a new "Latent Pedestrian Demand Warrant" was created and may be used in lieu of the "Pedestrian Volume Warrant"; individual "General Condition Warrant" point values were increased from

# EXECUTIVE SUMMARY

two points to three points, and the general conditions were consolidated from seven into six. Finally, the “Gap Time Warrant” scoring was revised to follow a bell-shaped distribution rather than a linear distribution. This warrant system elevates the pedestrian to a more balanced status with vehicles, bicycles, and other modes of transportation. It is expected to result in an increase in the number of locations qualifying for marked crosswalks.

If a location meets each of the Basic Warrants and scores a minimum of 16 points in the Point Warrants it qualifies for a marked crosswalk. However, before the installation of a marked crosswalk can be approved, additional treatments must be installed. A table identifies the category of crossing treatment that is needed based on vehicle volumes, vehicle speeds, and crossing distance. Another table lists the crossing treatments available to choose from within each category. Treatment descriptions are provided in a supplemental table.

A final table identifies potential treatments to consider at controlled intersections, including a description and general guidance regarding their installation or use.

## 2. CROSSWALK WARRANTS AND TREATMENT GUIDELINES

### Basic Warrants

In order for a proposed uncontrolled location to qualify for a marked crosswalk and supplemental treatments, a location must meet each of the following Basic Warrants.

#### 1. Pedestrian Volume Warrant

Pedestrian volumes must be equal to or greater than ten (10) pedestrians per hour during the peak pedestrian hour. Children under 13, elderly over 64 years and/or disabled persons count as 1.5 pedestrians. Alternatively, this warrant can be satisfied using Latent Pedestrian Demand if conditions (a), (b), or (c) under Table 2-2, 2-2.1b are met.

Crossing does not exist - Latent Pedestrian Demand used instead since condition (c) in Table 2-2.1b is met.

#### 2. Approach Speed Warrant

The 85<sup>th</sup> percentile approach speed must be equal to or lower than 40 MPH. This warrant does not apply when a pedestrian hybrid beacon or a pedestrian traffic signal will be installed.

85th percentile speed on Hollister Street is currently 42 MPH. With the proposed project improvements, narrower lanes and more development, speeds can be expected to decrease.

#### 3. Nearest Controlled Crossing

The proposed location must be further than 250 feet from the nearest controlled crossing location (measured from the nearest edge of the proposed marked crosswalk to the closest edge of the controlled crossing).

Proposed location is approximately 1,000' from the nearest controlled crossing location.

#### 4. Visibility Warrant

The motorist must have an unrestricted view of all pedestrians at the proposed location for the distance required by the following table (stopping sight distance is to be interpolated when 85<sup>th</sup> percentile speed is between 5 mph increments):

| 85 <sup>th</sup> Percentile Speed<br>(MPH) | Stopping Sight Distance<br>(feet) |
|--------------------------------------------|-----------------------------------|
| 25                                         | 150                               |
| 30                                         | 200                               |
| 35                                         | 250                               |
| 40                                         | 300                               |

Source: Caltrans Highway Design Manual, Table 201.1(March 7, 2014)

The unrestricted view to the south is approximately 750' and the unrestricted view to the north is approximately 700'.

The unrestricted view of pedestrians of at least 300' in each direction is due to the relatively straight alignment and level grade of the roadway.

#### 5. Illumination Warrant

The proposed location must have existing lighting.

The project is proposing lighting at the proposed crosswalk location and bus stop.

#### 6. Accessibility Warrant

The proposed location must have existing accessibility to disabled pedestrians or have accessibility improvements programmed.

The design of the crosswalk is ADA compliant.

## 2. CROSSWALK WARRANTS AND TREATMENT GUIDELINES

### Point Warrants

The Point Warrant has a total possible score of 38 points. As stated above, to qualify for installation of a marked crosswalk, a location must meet each of the Basic Warrants and score a minimum of 16 points in the Point Warrants. A summary of each of the Point Warrants and the allocation of points is presented in **Table 2-2**. A discussion of each of the Point Warrant variables follows the table.

Table 2-2: Point Warrants

| 2-2.1a Pedestrian Volume Warrant                                                                                                                         |        |                        |
|----------------------------------------------------------------------------------------------------------------------------------------------------------|--------|------------------------|
| Number of Pedestrians (Peak Hour)                                                                                                                        | Points | Total Available Points |
| 10 – 25                                                                                                                                                  | 4      | 10                     |
| 26 – 50                                                                                                                                                  | 8      |                        |
| 51+                                                                                                                                                      | 10     |                        |
| 2-2.1b Latent Pedestrian Demand Warrant (in lieu of Pedestrian Volume Warrant)                                                                           |        |                        |
| Condition                                                                                                                                                | Points | Total Available Points |
| (a) The proposed crosswalk is in a commercial, mixed land use, or high density residential area.                                                         | 3      | 10                     |
| (b) A pedestrian or shared use path is interrupted by a restricted crossing.                                                                             | 3      |                        |
| (c) A pedestrian attractor/generator is directly adjacent to the proposed crosswalk as defined in the explanatory notes below.                           | 4      |                        |
| 2-2.2 General Condition Warrant                                                                                                                          |        |                        |
| Condition                                                                                                                                                | Points | Total Available Points |
| (a) The nearest controlled crossing is greater than 300 feet from the proposed crosswalk.                                                                | 3      | 18                     |
| b) The proposed crosswalk will position pedestrians to be better seen by motorists.                                                                      | 3      |                        |
| (c) The proposed crosswalk will establish a mid-block crossing between adjacent signalized intersections or it will connect an existing pedestrian path. | 3      |                        |
| (d) The proposed crosswalk is located within $\frac{1}{4}$ mile of pedestrian attractors/generators as defined in the explanatory notes below.           | 3      |                        |
| (e) An existing bus stop is located within 100 feet of the proposed crosswalk.                                                                           | 3      |                        |
| (f) Other factors.                                                                                                                                       | 3      |                        |

proposed  
bus stop

## 2. CROSSWALK WARRANTS AND TREATMENT GUIDELINES

Table 2-2: Point Warrants (continued)

| 2-2.3 Gap Time Warrant                               |        |                        |
|------------------------------------------------------|--------|------------------------|
| Average Number of Vehicular Gaps per 5-Minute Period | Points | Total Available Points |
| 0 – 0.99                                             | 0      | 10                     |
| 1 – 1.99                                             | 1      |                        |
| 2 – 2.99                                             | 8      |                        |
| 3 – 3.99                                             | 10     |                        |
| 4 – 4.99                                             | 8      |                        |
| 5 – 5.99                                             | 1      |                        |
| 6 or over                                            | 0      |                        |
| <b>Total Available Points</b>                        |        | <b>38</b>              |

**See attached field work**

**Site achieves 16 points.**

**Table 2-2 Explanatory Notes:**

**2-2.1a Pedestrian Volume Warrant**  
The Pedestrian Volume Warrant assigns point values based on pedestrian crossing volumes at the proposed crosswalk. Children under 13, elderly over 64 years and/or disabled persons count as 1.5 pedestrians.

**2-2.1b Latent Pedestrian Demand Warrant (in lieu of Pedestrian Volume Warrant)**  
The Latent Pedestrian Demand Warrant may be used in lieu of the Pedestrian Volume Warrant.

**2-2.2 General Condition Warrant**  
The General Condition Warrant presents six (6) unique categories. A location can score either zero (0) or three (3) points for each unique category, making a total 18 possible points available. The general conditions include the following:

- (a) *The nearest controlled crossing is greater than 300 feet from the proposed crosswalk.*  
The distance should be measured from the proposed location of the crosswalk to the nearest controlled intersection, i.e. stop sign, traffic signal, etc.
- (b) *The proposed crosswalk will position pedestrians to be better seen by motorists.*  
This condition should be considered at locations where one leg of the intersection provides better sight distance than the other legs.
- (c) *The proposed crosswalk will establish a mid-block crossing between adjacent signalized intersections.*  
This warrant refers to a condition where there is a high pedestrian attractor/generator nearby, and adequate crossing can be provided that could help channelize a recognized heavy flow of mid-block pedestrians.
- (d) *The proposed crosswalk is located within  $\frac{1}{4}$  mile of the following pedestrian attractors/generators as defined below:*
  - International Border Crossing
  - Major Multi-Modal Transit Centers (>10,000 boardings per day)
  - Transit Stops (>1,000 boardings per day)
  - Elementary/Middle/ High Schools
  - Universities and Colleges
  - Neighborhood Civic Facilities (Libraries, Post Office & Religious Facilities)

## 2. CROSSWALK WARRANTS AND TREATMENT GUIDELINES

- Neighborhood and Community Retail
- Pedestrian Intensive Beaches
- Parks & Recreation (excludes non-useable open space)
- Mixed Land Uses (housing near employment and/or commercial)

(e) *A bus stop is located within 100 feet of the proposed crosswalk.*

This warrant is applicable if there is a bus stop within 100-feet of the proposed crosswalk.

(f) *Other factors.*

Other factors allow for extenuating circumstances not covered in the proposed warrants. This is to be evaluated using engineering judgment.

### 2-2.3 Gap Time Warrant

Gap time is the time needed for a pedestrian to cross the travelled lanes of a roadway at an average walking speed without the need for a driver to yield. The number of usable gaps (or gaps that exceed the minimum time needed to cross) are counted during the peak vehicular hour and averaged per five-minute period.

### Crossing Treatments

If the proposed crossing location meets the criteria set by both the Basic and Point Warrants, the next step is to evaluate the most appropriate crossing treatment(s) to be installed with the marked crosswalk. **Table 2-3** provides thresholds for determining whether additional treatments are required prior to installing a marked crosswalk. The thresholds are based on vehicle volumes, vehicle speeds, and pedestrian crossing distance at the proposed location. Location types are divided into categories A, B, C and D, and are used to determine the appropriate treatment for the proposed location.

Table 2-3: Crossing Treatment Thresholds for Uncontrolled Marked Crosswalks if Warrants are Met

| Crossing Distance <sup>2</sup> | Roadway ADT<br>(vehicles per day) |               |                |                 |                |                |
|--------------------------------|-----------------------------------|---------------|----------------|-----------------|----------------|----------------|
|                                | < 1,500                           | 1,501 – 5,000 | 5,001 – 12,000 | 12,001 – 15,000 | > 15,000       |                |
| < 40'                          | A                                 | B             | B              | C               | C              | D <sup>1</sup> |
| 40' to 52'                     | A                                 | B             | C              | C               | D <sup>1</sup> | D              |
| > 52'                          | A                                 | B             | C <sup>1</sup> | C               | D              | D              |

1. For streets with more than one lane at an approach or posted speed limit 30 mph or greater.  
2. Crossing distance can be measured to a pedestrian refuge island if one is present.

Source: City of San Diego (February, 2015)

### Crossing Treatments

**Table 2-4** presents treatment requirements for the categories shown in **Table 2-3**. As new devices or treatments are proven, they may be considered in lieu of these treatments, with the City Engineer's approval.

## 2. CROSSWALK WARRANTS AND TREATMENT GUIDELINES

Table 2-4: Crossing Treatments for Uncontrolled Marked Crosswalks if Warrants are Met

| Category | Crossing Treatments                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### Continental Crosswalks

The continental crosswalk, which is a high visibility crosswalk, is the City's standard crosswalk design for all marked crosswalk locations. Continental crosswalks have been shown to be more visible to approaching motorists and have been shown to improve yielding behavior. Continental crosswalks, along with the treatments identified in **Table 2-4** will enhance the pedestrian environment at marked crosswalks.

**Table 2-5** provides a toolbox of crossing treatments including a graphic example and definition of the treatments.

February 3, 2020 7:00AM-8:30AM

### Pedestrian Gap Study

- Within 5-minute periods during peak hour morning traffic, measured the number of times there is a gap long enough for a pedestrian to safely cross the street.
- Each test was videoed
- Results:

|                                                               | <b>Test #1</b>  | <b>Test #2</b>    | <b>Test #3</b>    |

Otay River Business Park - TIA

March 22, 2017

## **4.0 Project Description**

The proposed project of approximately 53 gross acres includes a Shopping Center (2.94 acres), an Industrial/Business Park (10.34 acres), an Industrial Park without commercial (17.97 acres), a Park (13.90 acres), new on-site roadways, and other areas that are not traffic generating that account for the remaining acreage. Opening day for the project may be as early as 2017.

### **4.1 Project Traffic Generation**

The project has four unique land uses that include a Shopping Center, an Industrial/Business Park, an Industrial Park, and a Future Park. The project traffic generation was calculated using SANDAG trip rates from the *Brief Guide of Vehicular Traffic Generation Rates for the San Diego Region*, April 2002. SANDAG provides trip generation rates and definitions of the unique land uses as follows:

Shopping Center is typically less than 15 acres and may include a drugstore, cleaners, beauty & barber shops, and fast food services. Since the exact tenants are unknown, the SANDAG acreage trip rate of 1,200 daily trips per acre were applied.

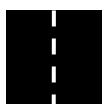

Industrial/Business Park includes a mix of industrial/manufacturing uses and commercial uses, which can include office, service, retail, wholesale, social club, food service, and health club. The SANDAG trip generation rates were averaged from eight Industrial/Business Parks that had an average breakdown of 56% industrial uses and 44% commercial uses. Since the exact tenants are unknown, the SANDAG trip rate of 200 daily trips per acre were applied.

Industrial Park includes a mix of industrial/manufacturing uses and limited commercial, which can include office and service. The SANDAG trip generation rates were averaged from three Industrial/Business Parks that had an average use of 92% industrial and 8% commercial. Since the exact tenants are unknown, the SANDAG trip rate of 90 daily trips per acre were applied.

Future Park is a park developed with sports facilities. The SANDAG trip generation rate is 50 daily trips per acre.

Two trip generation rates were applied: a driveway rate for project access points and a cumulative rate (accounts for primary and diverted trips) that was applied for all other analyzed roadways.

The project driveway volumes were calculated at 7,908 ADT with 658 AM peak hour trips and 857 PM peak hour trips. The cumulative traffic volumes were calculated at 6,414 ADT with 601 AM peak hour trips and 717PM peak hour trips. Please note this traffic analysis was based on an initial site design that was slightly larger than the final site plan due to lot line revisions. Therefore, this traffic analysis is slightly conservative and is based on the following trip generation with project driveway volumes calculated at 8,133 ADT, 679 AM peak hour trips, and 886 PM peak hour trips. The cumulative traffic volumes were calculated at 6,610 ADT with 621 AM peak hour trips and 742 PM peak hour trips. The reduction in the usable site resulted in 225 less daily driveway trips, 21 less AM trips, and 29 less PM trips while the cumulative trips saw a reduction of 196 daily trips, 20

less AM trips, and 25 less PM trips. The original trip generation (as analyzed in this traffic analysis) and the reduced trip generation based on the current site are both shown in **Table 8**.

**TABLE 8: PROJECT TRAFFIC GENERATION**

Original trip generation analyzed within this traffic study (higher than final lot sizes)

| Proposed<br>Land Use                                                            | Rate        | Size & Units | ADT           | % Split       | AM         |                       | PM          |                       |

Source: SANDAG Brief Guide of Vehicular Traffic Generation Rates for the San Diego Region, April 2002. Excel rounding may result in  $\pm 1$  to the above numbers. \*SANDAG did not list AM & daily pass-by; therefore, City of San Diego daily pass-by rate of 40% applied.

## 4.2 Project Streets and Alley Access

Project access will be from Main Street, Broadway, 7<sup>th</sup> Avenue, 4<sup>th</sup> Avenue, and a new on-site roadway (Street A/Faivre St) that will connect Broadway to 4<sup>th</sup> Avenue and from project driveways on Main Street, Broadway/Beyer Blvd, and 4<sup>th</sup> Avenue. A few project trips may use the existing alley between Broadway and 7<sup>th</sup> Avenue that runs parallel to and south of Main Street.

The project frontage along the alley includes Lots 1 and 2 with up to three potential driveways that would connect with the alley. The project applicant proposed to improve the alley with details and limits of improvements included on the civil engineering plans. Only a small percentage (i.e. 5%) of project traffic is anticipated to use the alley because there are better and wider roadways serving the project. Lots 1 and 2 are calculated to generate about 880 daily trips. Five percent of 880 is about 44 daily trips. If the remainder of the project added another 10 daily trips, the anticipated project traffic using the alley would be about 54 ADT. The City of Chula Vista does not have a capacity standard or threshold published for an alley; therefore, other agency documents were

**LOS Engineering, Inc.**

Traffic and Transportation

Otay River Business Park - TIA

reviewed and found that most described the function of an alley, but did not cite a specific ADT range, except for the City of Vista that did provide a range of up to 500 ADT for an alley (excerpt included in **Appendix F**).

### **4.3 Project Distribution and Assignment**

Project traffic was distributed to the study area roadways based on a distinct distributions for the Shopping Center, the Industrial/Business Park, the Industrial Park, and the City Park. The distribution were reviewed and adjusted by City of Chula Vista Engineering staff. The individual distributions are shown in **Figures 5, 7, 9, and 10**, respectively for each project type while the trip assignments are shown individually in **Figures 6, 8, 10, and 12**, respectively. The combined project assignment is shown in **Figure 13**.

### **4.4 Project On-site Parking**

On-site parking details will be included on the architectural site plan(s) once a lot is sold/leased and the exact building size and footprint is known.

### **4.5 Project On-site Truck Access, Loading, and Circulation**

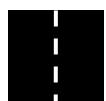

The final design and building configuration of the individual lots will only be available once an individual lot(s) is/are sold and designed for a specific buyer/tenant; therefore, the exact truck access, loading, and circulation cannot be established at this time. However, an example of a potential truck access, loading, and circulation plan is shown in **Figure 14**. The truck circulation template used by Smith Consulting Architects was based on a California Legal 65 foot truck.

### **4.6 Project Construction Traffic**

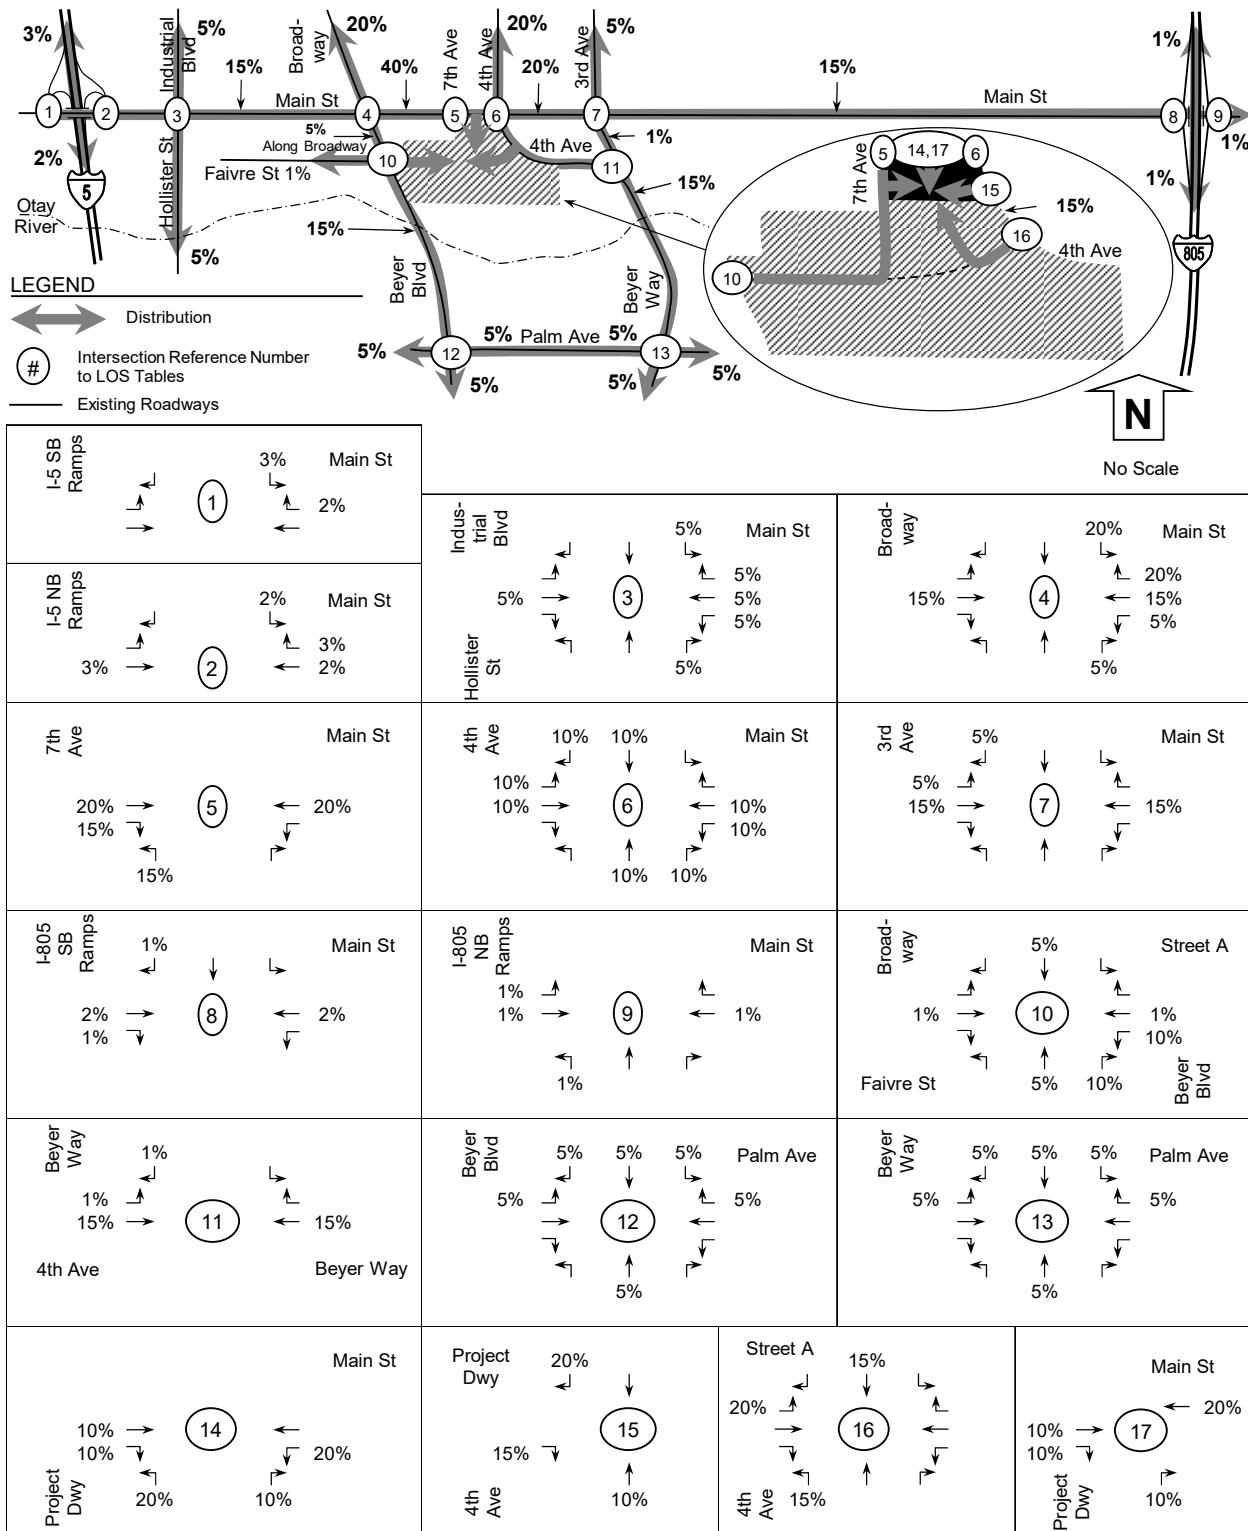

Construction traffic will include truck traffic for soil export, trucks bringing in building materials, and construction crews. A detailed construction phasing plan can only be prepared after the final lot site designs are completed, thus the exact number and frequency of trucks is unknown. However, the applicant does not anticipated more than 20 or 25 trucks per hour, which falls below the 50 peak hour trip SANTEC criteria typically used to determine if a truck haul route analysis is required. The construction crews will create less traffic than the final project; therefore, the analysis of the final project covers the traffic associated with the construction crews.

### **4.7 Transit Access**

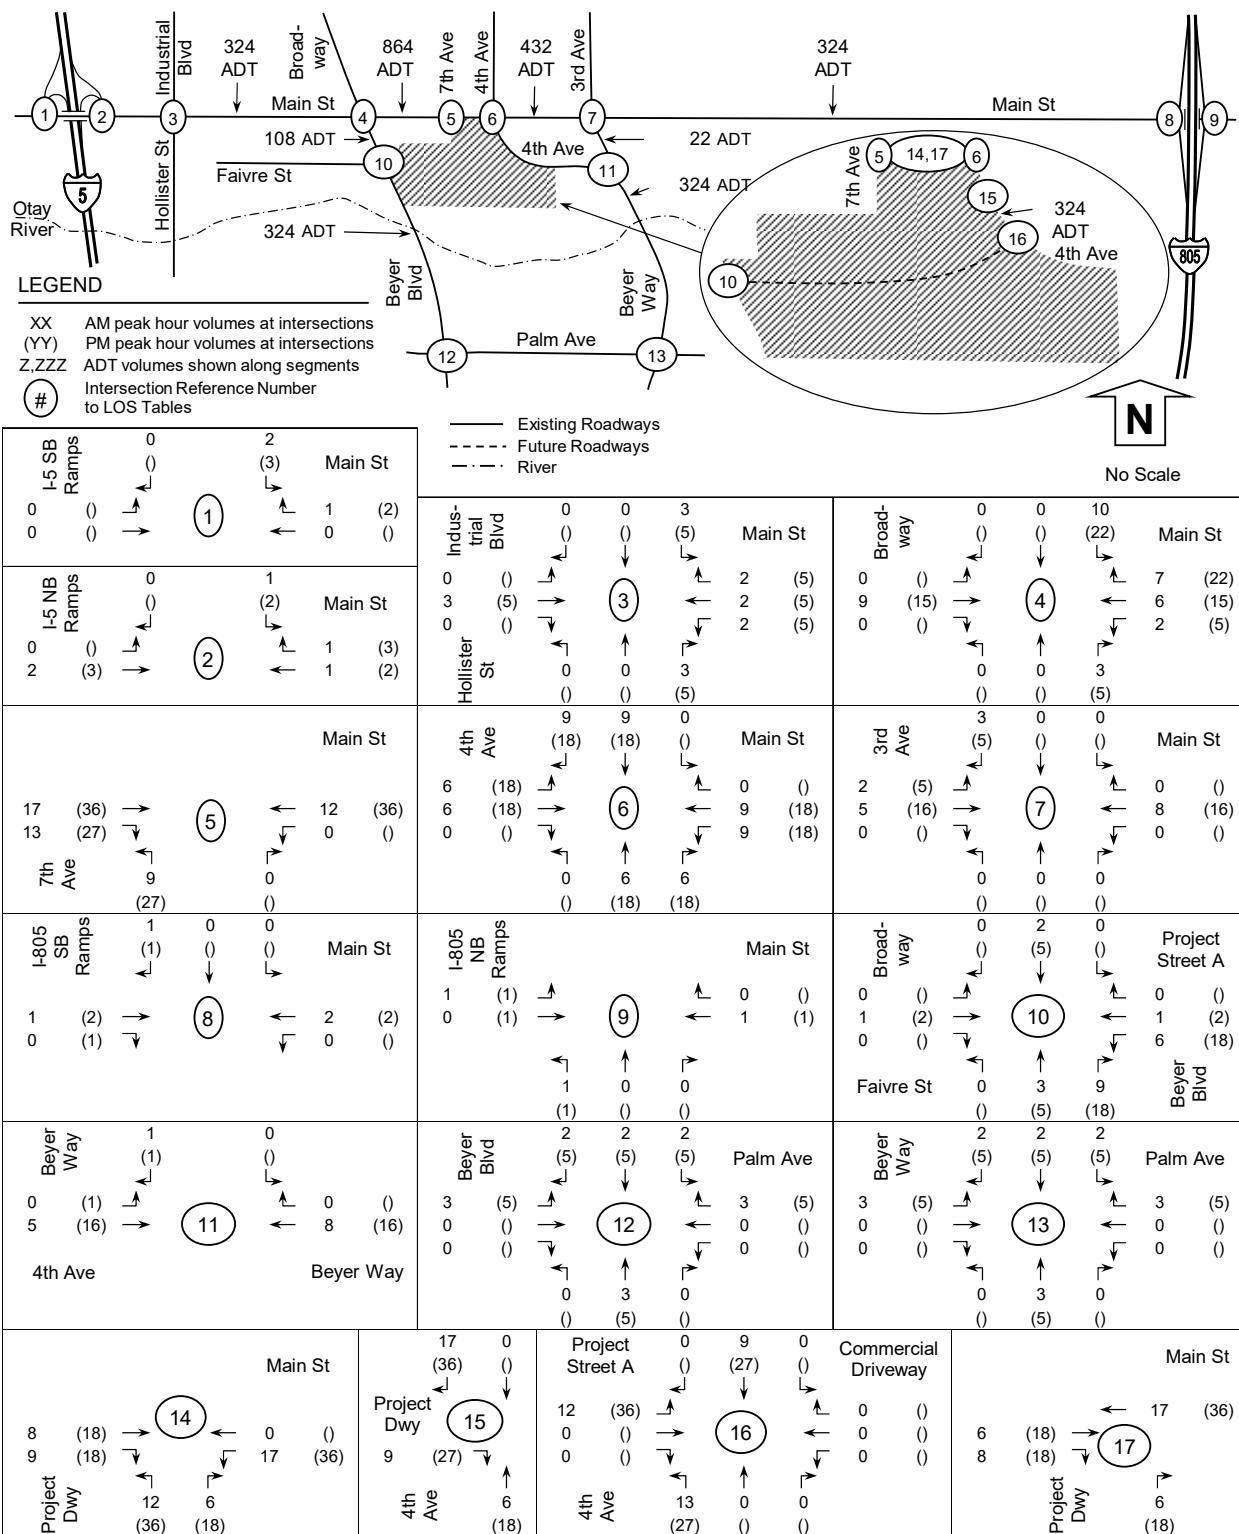

In the project vicinity, there are three bus routes as shown in **Appendix G**. Bus route 701 serves Main St from 4<sup>th</sup> Avenue to Hilltop Drive. Bus route 929 serves Beyer Way while bus route 932 serves Main St from Hollister St to Broadway.

**compass card****S/D/M and Youth Compass Card**

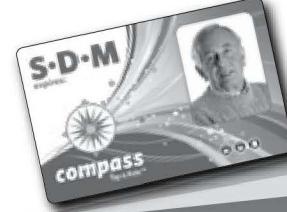

All riders using reduced fares must comply with one of the following options:

**Option 1** (Recommended by MTS)

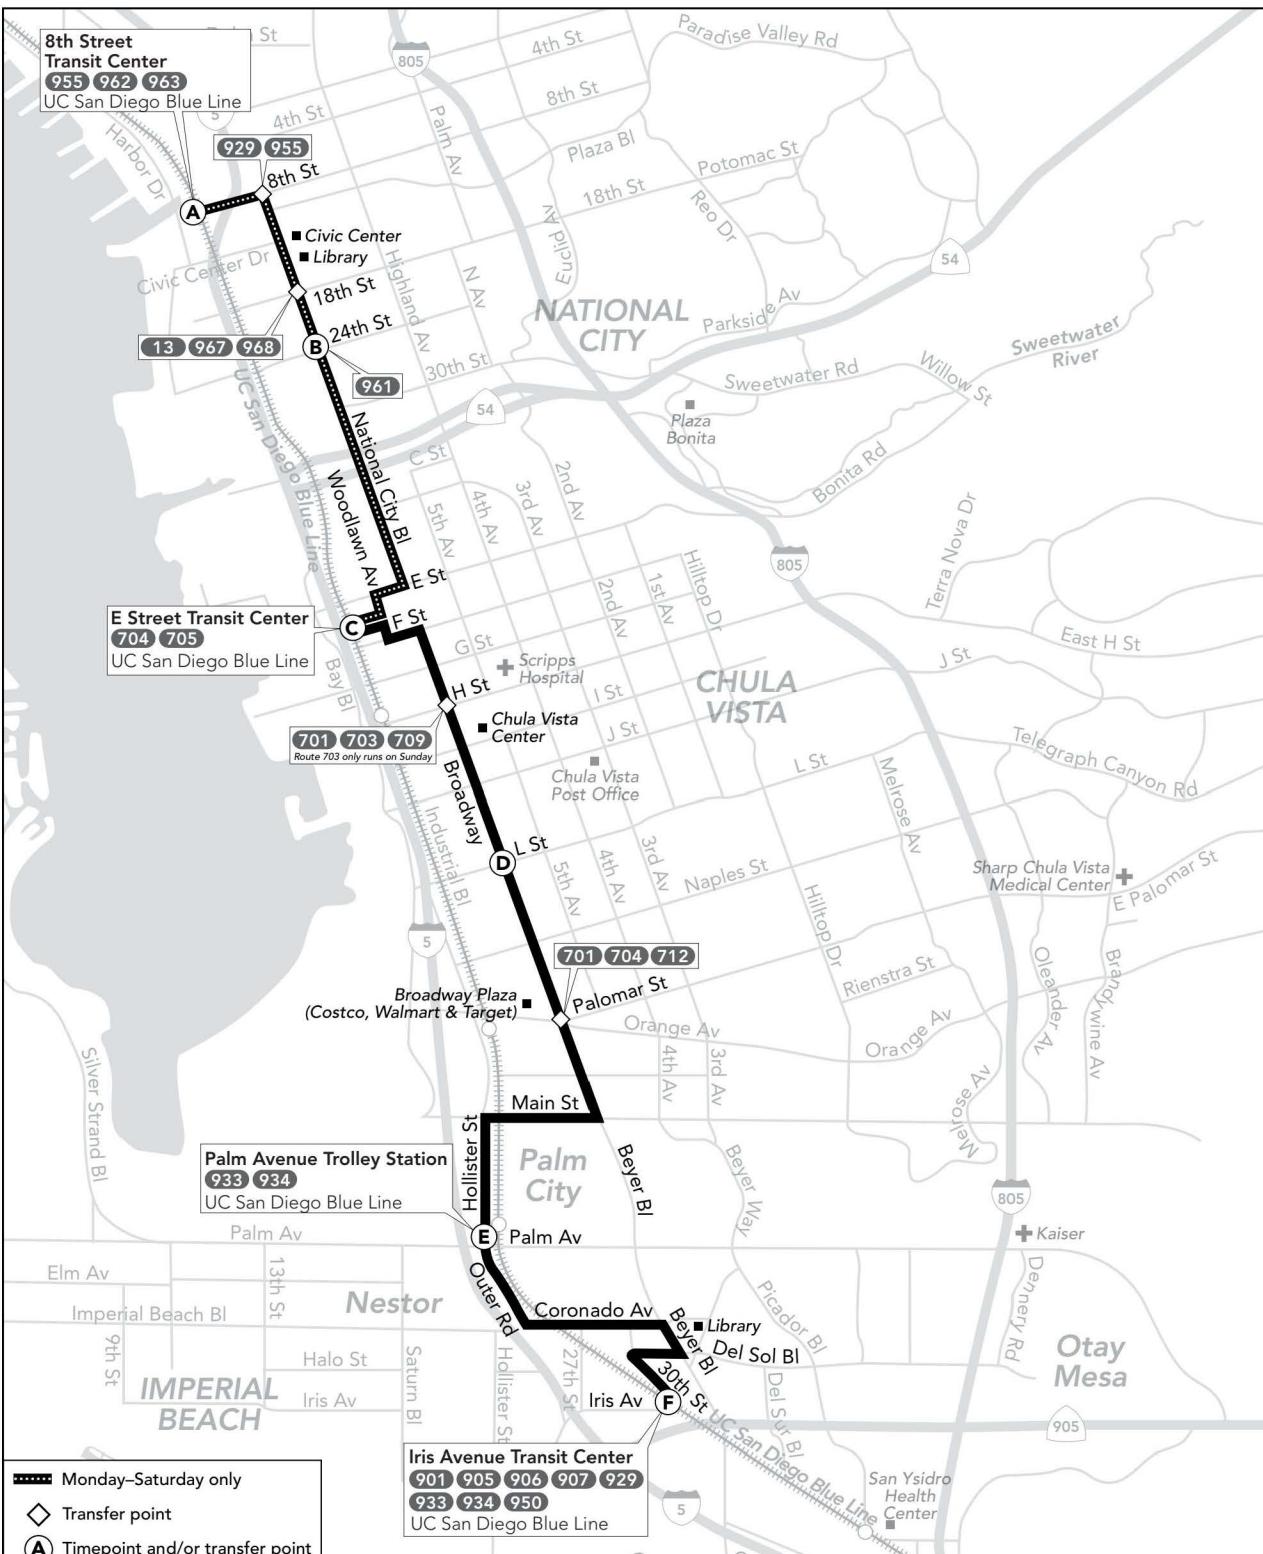

MTS offers a picture ID on a Compass Card to eliminate the need to carry multiple identifications for proof of eligibility.

**Option 2**

Riders using a standard S/D/M or Youth Compass Card or a one-way ticket must carry supporting identification to prove eligibility.

For additional benefits of Option 1 and/or list of valid forms of ID for Option 2 go to: [www.sdmts.com/reduced-fares](http://www.sdmts.com/reduced-fares)

The schedules and other information shown in this timetable are subject to change. MTS does not assume responsibility for errors in timetables nor for any inconvenience caused by delayed buses.  
Los horarios e información que se indican en este itinerario están sujetos a cambios. MTS no asume responsabilidad por errores en los itinerarios, ni por ningún perjuicio que se origine por los autobuses demorados.

| Adult / Adulto                                                                 | \$2.50         |
| Senior (60+)/Disabled/Medicare*<br>Mayores de 60 años/Discapacitados/Medicare* | \$1.25         |
| Child (5 and under)<br>Niño (5 años o menos)                                   | FREE<br>GRATIS |

One-way fares are valid for two hours from the time of purchase and in one direction only. Trolley one-way fares allow transfer between Trolley lines. Trolley one-way fares are not valid on buses.

Pasajes de ida son válidos por dos horas a partir del momento de compra y solo válido en una sola dirección. Boletos de ida del Trolley permiten traslado entre las líneas del Trolley. Boletos de ida del Trolley no son válidos en el autobús.

You may purchase monthly passes at all Albertsons stores in San Diego County, as well as select Vons and community outlet locations. Visit [sdmts.com](#) for store locations and more information.

Puede adquirir pases mensuales en todas las tiendas Albertsons en el condado de San Diego, así como en sedes seleccionadas de Vons y outlets comunitarios. Visite [sdmts.com](#) para consultar las ubicaciones de las tiendas y obtener más información.

**COMPASS CARD / Tarjeta Compass**

Passengers who have a Compass Card can load any day pass or monthly pass at Ticket Vending Machines. If you do not have a Compass Card, you can purchase only Adult fares at Ticket Vending Machines. There is a \$2 fee in addition to the price of your pass. For discounted fares on new Compass Cards, please purchase your pass at the Transit Store or any Compass Card outlet. Proof of eligibility is required to purchase and ride with a discounted fare.

Pasajeros que tienen una tarjeta Compass pueden cargar cualquier pase diario o mensual en las máquinas dispensadoras de boletos. Si no tiene una tarjeta Compass, solo puede comprar pasajes de adultos en las máquinas dispensadoras de boletos. Hay un cargo adicional de \$2 además del precio del pase. Para pasajes descontados en nuevas tarjetas Compass, favor de comprar su pase en los Transit Store o ubicación de las outlets de la tarjeta Compass. Se requiere identificación válida para comprar y viajar con una tarifa descontada.

**ACCESSIBLE SERVICE**  
**Accesibilidad de los servicios**

All Trolleys are equipped with ramps. Seats closest to the doors are reserved for senior and disabled riders.

Todos los Trolleys cuentan con rampas para sillas de ruedas. Los asientos más cercanos a las puertas están reservados por gentileza para pasajeros mayores o discapacitados.

**ANIMALS / Animales**

A trained service animal may accompany a rider with disabilities. Non-service animals must be in enclosed carriers and transported by passengers without the assistance of drivers or operators.

Se permite que un animal de servicio acompañe a un pasajero discapacitado. Los pasajeros deben transportar los animales que no sean de servicio en una jaula cerrada, sin ayuda de los conductores ni de los choferes.

**BIKES / Bicicletas**

- On Trolleys with stairs, board at rear doors of each car. Board low-floor cars at any door.
- Stay with bike to keep it secure.
- One bike is allowed per car during weekday rush hours, two bikes per car at all other times.
- MTS is not responsible for loss or damage to bicycles.
- En los Trolleys con escaleras, aborde en las puertas traseras. Aborde los Trolleys de piso bajo en cualquiera puerta.
- Por seguridad, manténgase junto a la bicicleta.
- En las horas pico durante la semana, sólo se admite una bicicleta por unidad. En otros tiempos, se admiten dos bicicletas.
- MTS no es responsable por el extravío o daño de bicicletas.

Amy,

Reponses to your questions below:

1. Yes, we will remove the SB stop at Conifer and can plan to install a new SB bus stop in front of the development. It would be our preference to also have a NB bus stop if there was a crosswalk and small patch of sidewalk. We like to install bus stops in pairs, because wherever people are taking the bus, they also have to come back and have a place to get off (and vice versa). I imagine residents will be quick to complain if there was only a bus stop in one direction.
2. Yes, MTS can install the MTS sign and street furniture. As discussed, the bus stop must have an 8' deep landing pad for ADA. A bench can be placed on sidewalks as narrow as 5-6'; a shelter would require a 10-11' sidewalk. We would select the furniture type primarily based on ridership. MTS would install and maintain the furniture.
3. Yes, thank you. It is very important to MTS that the development provide a safe, ADA compliant path to the trolley station. Also, the typical section shown below looks wide enough for a car to easily pass by the bus.

Thanks,  
Beverly

Beverly,

Thanks again for taking the time to meet with us in the field yesterday morning to discuss our options for the typical section on Hollister Street for the Bella Mar development at 408 Hollister Street.

We have a meeting with the City next Wednesday to discuss their comments on the TIA. The City has asked us to provide documentation from MTS on the following:

1. We can relocate the southbound bus stop to be in front of the project site on Hollister Street from the existing location at the northwest corner of Conifer Avenue.

2. MTS will provide the necessary amenities for the bus stops depending on the ridership (in accordance with Table 4.1 of the Designing for Transit Manual) if the project provides the appropriate landing pad space.
3. The proposed typical section for Hollister Street
  - a. As you saw, we are working with Monica on the feasibility of providing an ADA accessible path from the project site to the Palm Avenue Trolley Station including a crosswalk at Conifer Avenue and an accessible path to the station platform.
  - b. In the meantime, we are wondering if the following alternative typical section conflicts with MTS guidelines or if there are any concerns from your end

Thank you!

Amy

Transportation VMT CEQA Analysis

---

### Executive Summary

Senate Bill (SB) 743 was approved by the California legislature in September 2013, requiring changes to the California Environmental Quality Act (CEQA) methodology, specifically directing the Governor's Office of Planning and Research (OPR) to develop alternative metrics to the use of vehicular "level of service" (LOS) for evaluating transportation projects. OPR published the Technical Advisory on Evaluating Transportation Impacts in CEQA (Technical Advisory) in December 2018 providing recommendations for the preparation of transportation impact analysis under SB 743, suggesting Vehicle Miles Traveled (VMT) to replace LOS as the primary measure of transportation impacts. The Technical Advisory requires updated transportation procedures by July 1, 2020.

The City of San Diego's (City's) Transportation Study Manual (TSM) provides guidance on preparing transportation studies for projects within the City, pursuant to SB 743. The manual addresses the shift from LOS analysis to VMT analysis for CEQA, and updates the LOS methodology that will still be required as part of the Local Mobility Analysis (LMA) for the City.

This memorandum summarizes the VMT CEQA analysis and results for the proposed Bella Mar development located at 408 Hollister Street in the City of San Diego, California, in accordance with the City's TSM. The LMA for this development is provided in a separate document.

### Project Information

The proposed project is located at 408 Hollister Street in the Otay Mesa-Nestor Community in the City of San Diego, east of Imperial Beach and south of the City of Chula Vista. The approximately 14-acre site is bounded by Interstate 5 (I-5) to the west and Hollister Street to the east, between Palm Avenue to the south and Main Street to the north, as shown in **Figure 1**. The project site is currently vacant. The site is directly south of the Otay River Valley and north of two vacant adjacent sites. The east side of Hollister Street has an elevated railroad track for the MTS Trolley Blue Line, and a major transit station, the Palm Avenue Trolley Station is located less than  $\frac{1}{4}$  mile south of the Project site on Hollister Street.

The Bella Mar project is proposing to construct 380 multi-family residential units, including 100 affordable units. **Figure 2** shows the proposed project site plan. Access to the site will be established through construction of two unsignalized full-access driveways on Hollister Street.

## Methodology

The City's TSM establishes VMT as the performance metric for measuring transportation environmental impacts according to CEQA. The manual provides VMT screening criteria, significance thresholds, analysis methodologies, and mitigation measures for land development and transportation projects under CEQA. This memorandum focuses on the land development project requirements of the TSM.

### Initial Screening

Projects are compared against initial screening criteria to determine if the project can be considered less than significant for VMT impact based on project features regarding location, size, and use. The City's screening criteria for determining land development projects as less than significant for VMT include the following:

- **VMT Efficient Location** – Projects located in a VMT Efficient Location per the SANDAG Screening Map
  - Residential or commercial employment – 15% or more below the base year average resident VMT/capita or employee VMT/employee
  - Industrial employment – average or below average base year employee VMT/employee
- **Small Project (Trip-based)** – less than 300 daily unadjusted driveway trips
- **Locally Serving Retail** – 100,000 square feet gross floor area or less and serves a population of roughly 25,000 people or less based on a market area study
- **Locally Serving Public Facilities** – serves the surrounding community such as transit centers, public schools, libraries, post offices, park-and-ride lots, police and fire facilities, and government offices, or a public facility that is a passive use such as utility buildings, water sanitation, and waste management
- **Affordable Housing Project** – provides access to transit and meets one of the following criteria: affordable to persons with a household income equal to or less than 50% of the area median, housing for senior citizens, or housing for transitional foster youth, disabled veterans, or homeless persons
- **Mixed Use Project** – can use screening criteria above for each land use
- **Redevelopment Project** - results in a net decrease in total project VMT

If the project does not meet the screening criteria listed above, a detailed VMT analysis is required.

### VMT Analysis and Significance Thresholds

If a project is determined to require further VMT analysis after the initial screening, the appropriate VMT analysis methodology is applied per land use type as summarized in **Table 1**. The results of the VMT analysis are compared to the significance thresholds identified for each type of land use also provided in Table 1. If the project is found to have potential significant impacts, mitigation is required.

### Mitigation

If the project has a potential significant transportation impact as a result of exceeding the thresholds shown in Table 1, the impacts must be mitigated by reducing the project's resident VMT/capita or employee VMT/employee. Mitigation strategies are intended to reduce the number of automobile trips generated by the project or reduce the average vehicle trip length.

The California Air Pollution Control Officers Association (CAPCOA) *Quantifying Greenhouse Gas Mitigation Measures* document or the San Diego Association of Governments (SANDAG) *Mobility Management VMT Reduction Calculator Tool* may be used to quantify percent VMT reductions associated with proposed mitigation strategies.

### Bella Mar Project VMT Analysis

The initial screening evaluation for potential VMT impact for the Bella Mar project is summarized in **Table 1**.

**Table 1. Bella Mar VMT Analysis: Initial Screening**

| Screening Criterion                      | Project Analysis                                                                                                                                                                                                                                                                                                                                                                         | Pass? |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| <b>VMT Efficient Location</b>            | A screenshot of the screening map at the Project site is provided in <b>Figure 3</b> . Based on the screening map, the census tract that contains the Project site (Census Tract 10107) is a VMT efficient area, with 50 to 85 percent of the regional mean VMT per capita. Specifically, the resident VMT per capita for the census tract is 13.7, which is 77.9% of the regional mean. | YES   |
| <b>Small Project</b>                     | The project generates greater than 300 daily unadjusted driveway trips                                                                                                                                                                                                                                                                                                                   | No    |
| <b>Locally Serving Retail</b>            | Not Applicable                                                                                                                                                                                                                                                                                                                                                                           | No    |
| <b>Locally Serving Public Facilities</b> | Not Applicable                                                                                                                                                                                                                                                                                                                                                                           | No    |
| <b>Affordable Housing Project</b>        | Provides 100 affordable housing units and provides access to transit via sidewalk connection and new bus stops. The 100 affordable units may be excluded from VMT analysis.                                                                                                                                                                                                              | YES   |
| <b>Mixed Use Project</b>                 | Not Applicable                                                                                                                                                                                                                                                                                                                                                                           | No    |
| <b>Redevelopment Project</b>             | Not Applicable                                                                                                                                                                                                                                                                                                                                                                           | No    |

As described in the screening evaluation, the project is located within a VMT Efficient Location per the SANDAG screening map provided in **Figure 3**. The project also provides affordable housing near transit, which would exclude the affordable housing portion of the project from further VMT analysis. As a result, the project is not considered to have significant transportation impacts, and therefore does not require further transportation VMT CEQA analysis.

## Conclusion

The City of San Diego's Transportation Study Manual provides a list of screening criteria for land use and transportation projects to determine whether detailed VMT analysis is required. A project would have less than significant transportation impacts per CEQA if the project meets any of the screening criteria.

One of the characteristics in the screening criteria is a residential or commercial project located in a VMT Efficient Location, meaning the area is 15% or more below the base year average household VMT/capita or VMT/employee. Per the manual, the SANDAG screening map was used to determine the VMT/capita for the census tract where the project is located. Based on the SANDAG VMT Screening Tool, the census tract resident VMT per capita is 13.71 which is 77.9% of the regional mean. **As a result, the project is screened out from further VMT analysis, and is presumed to have less than significant transportation impacts per CEQA.**
