VIII. Appendices

- A. Terms and Abbreviations used in this Report
- B. Methods of Analysis
- C. Frequency of Analysis and Type of Sample
- D. Laboratories contributing Results used in this report
- E. QA Summary Report
- F. Staff Contributing to this Report
- G. System wide calculation definition
- H. Annual Flow Calibration Report

A. Terms and Abbreviations used in this Report

Along with standard abbreviations the following is a list of local/uncommon abbreviations and terms for the readers' reference.

PLANT TERMS	
U.S.EPA	- United States Environmental Protection Agency.
NPDES	- National Pollutant Discharge Elimination System.
WWTP	- Wastewater Treatment Plant.
WRP	- Water Reclamation Plant.
PLWWTP	- Pt. Loma Wastewater Treatment Plant
PLR	- Point Loma Raw (influent to the plant).
PLE	- Point Loma Effluent (effluent from the plant).
N-1-P	- North Digester Number 1, Primary, Pt. Loma
N-2-P	- North Digester Number 2, Primary, Pt. Loma
C-1-P	- Central Digester Number 1, Primary, Pt. Loma
C-2-P	- Central Digester Number 2, Primary, Pt. Loma
S-1-P	- South Digester Number 1, Primary, Pt. Loma
S-2-P	- South Digester Number 2, Primary, Pt. Loma
Dig 7	- Digester Number 7, Primary, Pt. Loma
Dig 8	- Digester Number 8, Primary, Pt. Loma
DIG COMP	- Digested Biosolids Composite; a composite of grabs taken from each of the in-service digesters.
RAW COMP	- A Composite of Raw Sludge taken over the preceding 24 hrs.
NCWRP	- North City Water Reclamation Plant
N01-PS_INF	- The plant primary Influent from Pump Station 64
N01-PEN	- The plant primary Influent from the Penasquitos pump station.
N30-DFE	- Disinfected Final Effluent
N34-REC WATI	ER - Reclaimed Water.
N10-PSP COMB	- raw sludge
N15-WAS LCP	- Waste Activated Sludge – low capacity pumps
MBC	- Metro Biosolids Center
MBCDEWCN	- Metro Biosolids Center Dewatering Centrifuges; typically the dewatered biosolids from these.
MBC_COMBCN	V - MBC Combined Centrate; the centrate from all the dewatering centrifuges.
	(The return stream from MBC to the sewer system.)
MBC_NC_DSL	- North City to Metropolitan Biosolids Center (MBC) Digested Sludge Line.
Dig 1	- MBC Digester number 1.
Dig 2	- MBC Digester number 2.
Dig 3	- MBC Digester number 3.
Biosolids	- In most cases Biosolids and digested (a processed) Sludge is synonymous.
Field Replicate	- Separate samples collected at approximately the same time from the same sample site.

<u>UNITS</u>

mg/L	milligrams per liter
ug/Lmicrogram	ms per liter = 0.001 mg/L
ng/L nanogra	ms per liter = 0.001 ug/L
mg/Kg	milligrams per kilogram
ug/Kg	
ng/Kg	nanograms per kilogram
pg/L	picograms per liter
pg/Kg	
pc/L or pCi/L	
TU	toxicity units
ntu nep	helometric turbidity units
^o C degrees Cel	sius = degrees centigrade
^o C degrees Cel MGD	sius = degrees centigrade million gallons per day
^o C degrees Cel MGD umhos/cm	sius = degrees centigrade million gallons per day nicromhos per centimeter
^o C degrees Cel MGD	sius = degrees centigrade million gallons per day nicromhos per centimeter microsiemens = umhos
^o C degrees Cel MGD umhos/cm n uS mils/100 mL m	sius = degrees centigrade million gallons per day nicromhos per centimeter microsiemens = umhos iillions per 100 milliliters
^o C degrees Cel MGD umhos/cm n uS	sius = degrees centigrade million gallons per day nicromhos per centimeter microsiemens = umhos iillions per 100 milliliters not detected
^o C degrees Cel MGD umhos/cm n uS mils/100 mL m nd NA not analyzed	sius = degrees centigrade million gallons per day nicromhos per centimeter microsiemens = umhos nillions per 100 milliliters not detected (when in a data column)
^o C degrees Cel MGD umhos/cm n uS mils/100 mL m nd	sius = degrees centigrade million gallons per day nicromhos per centimeter microsiemens = umhos nillions per 100 milliliters not detected (when in a data column) not required

CHEMICAL TERMS & ABBREVIATIONS:

AA	Atomic Absorption Spectroscopy
BOD	.Biochemical Oxygen Demand
CN ⁻	.Cyanide
	.Chemical Oxygen Demand
Cr ⁶⁺	.Hexavalent Chromium
D.O	.Dissolved Oxygen
DDD	.Dichlorodiphenyldichloroethane
	.(a.k.a. TDE-
	tetrachlorodiphenylethane)
DDE	.Dichlorodiphenyldichloroethylene
	.Dichlorodiphenyltrichloroethane
FeCl ₃	.Ferric Chloride
G&O	.Grease and Oil
GC	.Gas chromatography.
GC-ECD	.Electron Capture Detector
GC-FID	.Flame Ionization Detector
GC-FPD	.Flame Photometric Detector
GC-MS	.Mass Spectroscopy
H ₂ S	.Hydrogen Sulfide
Hg	.Mercury
	.Ion Chromatography
ICP-AES	.Inductively Coupled Plasma-
	Atomic Emission Spectroscopy
FeCl ₃	.Ferric Chloride .Grease and Oil .Gas chromatography. .Electron Capture Detector .Flame Ionization Detector .Flame Photometric Detector .Mass Spectroscopy .Hydrogen Sulfide .Mercury .Ion Chromatography .Inductively Coupled Plasma-

MDL	Method Detection Limit
MSDl	Mass Spectroscopy Detector
NH3	Ammonia
	Ammonia Nitrogen
NH4 ⁺	Ammonium ion
NO ₃ ⁻ l	
	Pulsed Amperometric Detector
	Polychlorinated Biphenyls
PO ₄ ³⁻ l	Phosphate
SO4 ²⁻	Sulfate
SS	Suspended Solids
TBT	Tributyl tin
	Total Chlorinated Hydrocarbons
((i.e. chlorinated pesticides &
]	PCB's)
TCLP	Toxicity Characteristic Leaching
	Procedure
TDS	Total Dissolved Solids
TS	Total Solids
	Total Volatile Solids
	Volatile Suspended Solids
	1

B. Methods of Analysis

WASTEWATER INFLUENT and EFFLUENT (General)

Analyte	Description	Instrumentation	Reference ¹
Alkalinity	Selected Endpoint Titration	Mettler DL-21 & 25 Titrator Orion 950	(i) 2320 B
Ammonia Nitrogen	Distillation and Titration	Buchi Distillation Unit K-314, B-324, K-350 Orion 950 pH Meter Mettler DL25 titrator	(i) 4500-NH3 B & C
Biochemical Oxygen Demand (BOD-5 Day)	Dissolved Oxygen Meter with Dissolved Oxygen Probe	YSI-5000 DO Meter YSI-5100 DO Meter YSI 59 DO Meter (5905 Probe)	(i) 5210 B
Biochemical Oxygen Demand (BOD-Soluble)	Dissolved Oxygen Probe	YSI-5000 DO Meter YSI-5100 DO Meter YSI 59 DO Meter (5905 Probe)	(i) 5210 B
Chemical Oxygen Demand (COD)	Closed Reflux / Colorimetric	Hach DR-2010 UV/Vis spectrophotometer	HACH 8000
Conductivity	Conductivity Meter with Wheatstone Bridge probe	YSI-3100, YSI-3200, Orion 115A,Orion 250, Accumet Model 150	(g) 2510 B
Cyanide	Acid Digest/Distil./Colorimetric	Hach DR-4000/Vis	(i) 4500-CN E
Floating Particulates	Flotation Funnel	Mettler AX-105 Mettler AG 204 Balance	(g) 2530 B
Flow	Continuous Meter	Gould (pressure sensor), ADS (sonic sensor), or Venturi (velocity sensor)	
Hardness; Ca, Mg, Total	ICP-AES / Calculation	TJA IRIS	(a) 200.7 (h) 2340 B
Kjeldahl Nitrogen (TKN)	Macro-Digestion / Titration	Labconco digestion block Buchi B-324 distiller & Mettler DL25 titrator	(i)Digestion= 4500-Norg B
Oil and Grease	Hexane Extraction / Gravimetric	Mettler AX-105 Balance	(a) 1664A
Organic Carbon (TOC)	Catalytic Oxidation / IR Water Production Laboratory)	Shimadzu ASI-5000	(f) 5310 B
pН	Hydrogen+Reference Electrode	Various models of pH meters.	(i) 4500-H+ B
Radiation (alpha & beta)	Alpha Spectroscopy Gamma Spectroscopy	Canberra 7401 (alpha) Canberra GC25185 (beta)	(h) 7110 B
Solids, Dissolved-Total	Gravimetric @ 180°C using analytical balance	Mettler AG204,AX105,AB204	(i) 2540 C
Solids, Settleable	Volumetric	Imhoff Cone	(i) 2540 F
Solids, Suspended-Total	Gravimetric @ 103-105°C	Mettler AG204,AX105,AB204	(i) 2540 D
Solids, Suspended-Volatile	Gravimetric @ 500°C	Mettler AG204,AX105,AB204	(i) 2540 E
Solids, Total	Gravimetric @ 103-105°C	Mettler AG204,AX105,AB204	
Solids, Total-Volatile	Gravimetric @ 500°C	Mettler AG204,AX105,AB204	(a) 160.4
Temperature	Direct Reading	Fisher Digital Thermometer	(g) 2550 B
Turbidity	Nephelometer Turbidimeter	Hach 2100-N Meter Hach 2100-AN Meter	(g) 2130 B
Bromide, Chloride, Fluoride, Nitrate, Phosphate, Sulfate	Ion Chromatography	Dionex ICS-3000	(d) 300.0

¹ Reference listing is found following this listing of analytical methods.

WASTEWATER INFLUENT and EFFLUENT (Metals)

Analyte	Description	Instrumentation	Reference ¹
Aluminum	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Antimony	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Arsenic	Hydride Generation / AA	TJA Solaar M6	(h) 3114 C
Barium	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Beryllium	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Boron	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Cadmium	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Calcium	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Chromium	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Cobalt	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Copper	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Iron	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Lead	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Lithium	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Magnesium	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Manganese	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Mercury	Thermal / AA	Milestone DMA80	(g) 3112 B
Mercury	Cold Vapor Generation / AF	Leeman Hydra Gold	(w) 1613E
			and 245.7
Molybdenum	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Nickel	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Potassium	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Selenium	Hydride Generation / AA	TJA Solaar M6	(h) 3114 C
Silver	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Sodium	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Thallium	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Vanadium	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7
Zinc	Acid Digestion / ICP-AES	TJA IRIS	(e) 200.7

E. QA Report Summary

(excerpt from our <u>Quality Assurance/Quality Control Report for Calendar Year 2010</u>, March 30, 2011)

Summary and Overview:

The Wastewater Chemistry Services Section, Metropolitan Wastewater Department, City of San Diego performs most of the NPDES and other permit and process control chemical and physical testing for the City of San Diego E.W. Blom, Pt. Loma Wastewater Treatment Plant (PLWWTP), North City Water Reclamation Plant (NCWRP), South Bay Water Reclamation Plant (SBWRP), and the Metro Biosolids Center (MBC). We also perform the chemical/physical testing of ocean sediment and fish tissue samples for the Ocean monitoring program for the City of San Diego (PLWWTP Ocean Outfall and SBWRP Ocean Outfall) and the International Boundary and Water Commission, International Treatment Plant outfall. We also perform environmental testing for various customers, both internal to the City of San Diego and for other agencies.

The QA/QC activities of the Laboratory are comprehensive and extensive. Of the 37,282 samples received in the Laboratory in 2011, approximately 33% were Quality Control (QC) samples, such as blanks, check samples, standard reference materials, etc. 118 different analyses were performed throughout the year resulting in 262,329 analytical determinations. Of the determinations, 113,016 (~43%) were QC determinations (e.g. blanks, lab. replicates, matrix spikes, surrogates, etc.) used to determine the accuracy, precision, and performance of each analysis and batch.

We have 5 separate laboratory facility locations, each with its own California ELAP (Environmental Laboratory Accreditation Program) certification for the fields of testing required under California regulations. This is a rigorous program involving continuing independent blind performance testing, biannual comprehensive audits, and extensive documentation requirements. Each of the 5 laboratory facilities in the Metropolitan Wastewater (Metro) Department are independently certified and copies of those certifications are included at Attachment 1. California ELAP certifies fields of testing (methods/analytes) only for Water, Wastewater, and Hazardous materials for which methods are published in the Federal Register or specifically approved in regulation by U.S.EPA. Additionally, the Laboratory performs analyses using methods for which certification does not exist, such as ocean sediment and sea water determinations. Those methods have been developed in-house, derived from or in collaboration with other scientific laboratories (e.g. Scripps Institute of Oceanography, Southern California Coastal Water Research Project, et. al.) and have been used extensively in multi-agency EPA and State sponsored studies over the past several years. Many methods of analysis developed for matrices and applications not within ELAP jurisdiction have been adapted from ELAP listed methods. In all cases, we apply generally accepted standards of performance and quality control to methods.

Additionally, the operating division and all Metro Department Laboratories maintained International Standards Organization (ISO) 14001 Environmental Management Systems certification.

Contract laboratories are also required to use only approved methods for which they hold certification for, and/or are approved by the appropriate regulatory agency (e.g. SDRWQCB). Copies of their certifications are included as Attachment 2.

The following report summarizes the QA/QC activities during 2011 and documents the laboratory information and certifications for those laboratories which provided data used in NPDES and other permit monitoring or environmental testing during the year.

Laboratories Contributing Results used in this report.

Facilities & Scope:

The Wastewater Chemistry Services Section (WCS) comprises five geographically separated laboratories. The Section's main laboratory facilities and headquarters located at the Alvarado Joint Laboratory building in La Mesa and the four satellite wastewater chemistry laboratories located at MWWD treatment plants maintain individual California Department of Health Service, Environmental Laboratory Accreditation Program (ELAP) certification in their respective Fields of Testing (FoT). Each laboratory has its own U.S.EPA Lab Code as shown in the following table.

Laboratory Facility	Laboratory	Address	Phone	EPA Lab.	ELAP
				Code	Cert. No.
Alvarado Laboratory	Wastewater Chemistry	5530 Kiowa Drive, La	619.668.3215	CA00380	1609
	Laboratory	Mesa CA 91942			
Point Loma Satellite Lab	Pt. Loma Wastewater	1902 Gatchell Rd.,	619.221.8765	CA01435	2474
	Chemistry Laboratory	San Diego, CA 92106			
North City Water Reclamation	North City Wastewater	4949 Eastgate Mall,	858.824.6009	CA01436	2477
Plant Satellite Lab	Chemistry Laboratory	San Diego, CA 92121			
Metro Biosolids Center Satellite	Metro Biosolids Center	5240 Convoy Street,	858.614.5834	CA01437	2478
Lab	Wastewater Chemistry Lab	San Diego, CA 92111			
South Bay Water Reclamation	South Bay Wastewater	2411Dairy Mart Rd.,	619.428.7349	CA01460	2539
Plant Satellite Lab	Chemistry Laboratory	San Diego CA 92154			

The information presented in this report applies to the Wastewater Chemistry Services Section, including all of the laboratories listed above, unless specified otherwise. The main laboratory at Alvarado is the main office for the WCS and contains the most extensive laboratory facilities of the several laboratories. Along with a variety of process control and wet chemistry analyses, this facility also handles all of the trace metals, pesticides/organics determinations, and other analyses. The satellite laboratories are primarily dedicated to process control, wet chemistry, and other analyses directly related to the support of the operations of the co-located wastewater treatment plant.

The Wastewater Chemistry Services Section performs most of the NPDES and other permit and process control chemical and physical testing for the:

- <u>E.W. Blom, Pt. Loma Wastewater Treatment Plant (PLWWTP)</u>, NPDES Permit No. CA0107409/ Order No. R9-2009-0001, including the ocean monitoring program.
- North City Water Reclamation Plant (NCWRP), Order No. 97-03.
- <u>Metro Biosolids Center (MBC)</u>, no permit, but monitoring requirements contained in Permit No. R9-2009-0001.
- South Bay Water Reclamation Plant (SBWRP), NPDES Permit No.CA0109045/ Order No. 2006-067.
- <u>Ocean monitoring program for the International Boundary and Water Commission</u>, International Treatment Plant.
- <u>Other environmental testing for various custo</u>mers, both internal to the City of San Diego and other public agencies.

A small portion of the required monitoring testing sub-contracted out to laboratories certified by ELAP for those analyses, specifically;

- Gross alpha- and Beta radiations are analyzed by Test America Laboratories, Inc., Richland Division
- Herbicides are analyzed by Test America Laboratories, Inc, Nashville Division
- Total organic carbon (TOC) in water are analyzed by the Water Quality Laboratory, City of San Diego, Water Department.
- Dioxin and Furans in solids and wastewater are analyzed by Frontier Analytical Laboratory.

Copies of these laboratories' ELAP certifications are included as Attachment 2. The City of San Diego pays for additional QC samples (replicates, blanks, and spikes) as a routine quality check on contracted laboratory work. This is beyond the usual and customary practices with contract laboratory work.

Ocean monitoring:

While there are no recognized State certifications for laboratory analyses of marine environmental samples (e.g. seawater, sediments, various tissues, etc.), the City of San Diego has been a leader in the development and standardization of analytical methods for determinations in these areas.

Many of the methods are novel approaches developed after extensive research and development from other published work (e.g. organo-tin analyses, sediment grain size, etc.) or adaptations of exiting EPA methods (e.g. SW 846 Method 8082 for PCB congeners in sediments, etc.). In all of these cases we participate in extensive inter-laboratory calibration studies. Some of the most extensive studies have involved the participation of several public, academic/research, and private laboratories under the umbrella of the Southern California Coastal Water Research Project (SCCWRP). These programs are repeated periodically as part of the Southern California Bight Regional Monitoring/Survey Project. This is a massive sampling and monitoring program participated in by all of the major Publicly Owned Treatment Works (POTWs), California Water Resource Control Boards, and research organizations.

Our laboratory is a reference (referee) laboratory for the NRCC (National Research Council of Canada) CARP-2 Certified Reference Material (CRM) for fish tissue. This was adopted as the standard reference material for QC QA for the Southern California Bight Regional Project. This sample is also used world-wide as a standard reference material. We have worked with NIST to develop a West Coast marine sediment and fish tissue standard reference material (SRM).

QA/QC Activities Summary:

Report for January 1, 2011 - December 31, 2011.¹⁷

The sample distribution for 2011 is not significantly changed from 2010. 262,329 analytical determinations were made on 37,282 samples received by the Laboratory in 2011(see table A.). Of these 12,176 or 33% were Quality Control (QC) samples. 12.6% were blanks and 20.0% check or reference samples.

	2011	2011
	Number of	Percent of total
Table A. Samples	Samples	samples
Customer/Environmental	25,106	67.34%
samples		
Quality Control (QC) samples	12,176	32.66%
Total Samples	37,282	100.00%
QC Samples:		
Blanks:	_	
FIELD_BLANK	194	0.52%
REAGENT_BLANK	16	0.04%
TRIP BLANK	2	0.01%
METHOD_BLANK	4,501	12.07%
Total Blanks:	4,713	12.64%
Check samples:	_	
External Check samples	4,450	11.94%
Internal Check samples	2,967	7.96%
Spike Check samples	34	0.09%
SRMs (Standard Reference Material)	12	0.03%
Total Check Samples:	7,463	20.02%
Total QC Samples:	12,176	32.66%

High levels of QC are used for laboratory determinations. 43% of the 262,329 determinations were QC (e.g. blanks, lab replicates, matrix spikes, surrogates, etc.). If calculated for the 256,348 customer determinations only, the percentage increases to 44%.

2.3% of total analytical determinations or 0.5% of analytical batches did not meet internal QA review due to a variety of criteria, e.g. unsuccessful calibration, unacceptable QC performance, etc. Samples having analytical determinations that were rejected are reanalyzed, or, if that is not possible, the data is either not reported or reported but flagged as having not met data quality objectives and may not be suitable for compliance

¹⁷ Data counts (metrics) were obtained on March 28, 2012 and do not include analyses that were underway, but incomplete as of that time. All table data is based on samples collected between January 1, 2011 and December 31, 2011. This data summary is comprehensive; includes all laboratory analyses work for all customers, projects, and programs unless otherwise indicated.

 $Y: EMTS \ 41. Sections \ WCS \ EPORTS \ EVWTP \ Annual \ 2011 \ Final Sections \ 2011 \ Annual \ docx$

determination.

	Number	Percent of total
Total number of analytes/results determined:	262,329	NA
Total results not complete ² :	351	0.1%
No. of results for Customer/ Environmental Samples ^{1,3} :	256,348	97.7%
Total number of rejected results:	5,981	2.31%
No. of results for blanks ³ :	24,808	9.5%
No. of results for matrix spikes ³ :	15,902	6.1%
No. of results for Check samples ³ :	32,416	12.4%
No. of results for Replicates ³ :	28,846	11.0%
No. of results for surrogates ³ :	11,044	4.2%
Total QC analyses run ³ :	113,016	43.1%

1 – matrix spike, replicates, surrogates are also part of the total for Customer/Environmental samples.

2 – as of March 28, 2012.

3 – percent of QC samples calculated from grand total of 262,329.

NOTE: Analysis, for the purposes of the metrics used in this report generally refer to each analyte determined in each sample in a batch. For example, an analysis (determination) of several metals in a sample (e.g. iron, nickel, lead) would total as 3 analyses in the expression of totals such as those in the Analyses table on the preceding page. This method of calculation has been used for many years and, with batch and method, is useful comparative measure of laboratory performance and is one of the fundamental constants in applying quality control measures.

	No. of	
	Batches	Percent of total
Total number of analytical batches:	14,309	
Total number of rejected analytical batches:	66	0.46%
Incomplete batches (as of March 28, 2011):	0	0.00%

Outside laboratories

A small number of permit required analyses are contracted out, including gross alpha- & Beta- radiation, and Total Organic Carbon in wastewater as summarized below. Herbicides analysis contracted to Test America Laboratory.

I	Results from sub-contracted laborate	ory
Laboratory	Analytes	% of Total in-house Analytes
Test America	338	0.13%
Frontier Labs	3079	1.19%
Water Quality, City of San Diego	74	0.03%
Total sub-contracted laboratory result	s: 3,491	1.35%

QA Plan:

A copy of our Laboratory's current Quality Assurance Plan is included as Attachment 3. The Quality Assurance Plan was updated in September 2011.

Performance Testing (PT) Studies for 2011:

The Wastewater Chemistry Laboratories participates in required ELAP and U.S.EPA PT studies throughout the year. We participated in 9 PT studies in 2011. Each of our geographically separated laboratory facilities participated individually (as required by ELAP). All PT studies were purchased from ERA and were successfully completed. When results submitted were determined to be outside of study acceptance limits the laboratory reviewed internal protocols, modified procedures were necessary and participated in a subsequent study for the analytes in question. A PT study was completed with satisfactory results for all analytes by inhouse chemistry laboratories.

The results of the Laboratory PT studies for 2011 are summarized in the following tables.

DMRQA (Discharge Monitoring Report – Quality Assurance)

The State of California did not conduct a regular DMR-QA study this year; 2011

Excerpt from state letter:

-----Original message----- **From:** Bill Ray <bray@waterboards.ca.gov> **To:** "Meyer, Steve" <SMeyer@sandiego.gov> **Sent:** Fri, Mar 4, 2011 23:09:36 GMT +00:00 **Subject:** Re: Out of Office: DMR-QA Waiver information and participation.

Thank you for the information.

The State is not conducting a regular DMR-QA study this year. Please perform those PT samples your in-house lab needs for Certification purposes an instruct all of your contract labs to do the same. Both in-house and contract labs need to tell their respective PT providers to submit the information to the State Board. The preferred method is electronically in the form of the standard EPA data file transfer format and a scanned PDF of the report to this e-mail.

G. System-wide calculation definition

System-wide removals are a practical extension of the "Adjusted Removals" previously reported. Adjusted removals were used to determine removal efficiency of TSS and BOD, during the period when biosolids dewatering occurred at Fiesta Island. The wastewater removed by dewatering (e.g. belt filter press or drying bed decant) was returned to the Point Loma WWTP headworks and contained a certain amount of solids. In order to account for the removal and return of TSS and BOD, on a complete mass-balance basis, the Adjusted Removals were determined. That calculation was relatively straight forward and included removing the contribution to the Pt. Loma WWTP influent of the returned stream. The calculation was done on a mass balance basis to fully account for the solids and BOD contributions returned back to the system.

With the replacement of Fiesta Island biosolids processing by the Metro Biosolids Center (MBC) and the addition of the NCWRP (North City Water Reclamation Plant) in the Metro System, the removal and return of solids to Pt. Loma WWTP was complicated by the addition of multiple inputs and outputs to the system. To calculate the system-wide removals, the net total inputs and outputs were determined and included in the updated calculation18. The determination of System-wide removals is represented by Equation 1 on the next page. This simplified diagram graphically shows the relationships of the input and output streams. The Tijuana interceptor (emergency connection) has not contributed flows since September 2003. The South Bay Water Reclamation Plant (SBWRP) is not shown since it currently has no net contribution or solids removal.

 $Y: EMTS \ 41. Sections \ WCS \ REPORTS \ PLWWTP \ Annual \ 2011 \ Final Sections \ 2011 \ Annual \ docx \ Neutrino \ Ne$

¹⁸ Calculations are performed by a computer database application working with Metro System flow and concentration data.

Equation 1. System-wide %Removal= <u>(Σ</u> 100%	<u>System</u>	Influents)-(ΣReturn Streams) – (ΣOutfall Discharge) x
100%	Σ	System Influents – ΣReturn Streams
Where,		
System Influents	=	Point Loma Wastewater Treatment Plant Influents, NCWRP Influent Pump Station (i.e. Pump station 64), NCWRP Influent from Penasquitos Pump Station
Return Streams	=	NCWRP Filter Backwash, NCWRP Plant Drain, NCWRP Secondary Effluent, NCWRP Un-disinfected Filtered Effluent Bypass, NCWRP Final Effluent Metro Biosolids Center Centrate

The TSS and BOD₅ concentrations, together with the flow rate, of each stream are measured daily and mass emissions (pounds a day) for each stream determined. The above formula is applied on the resultant mass balances and the system-wide removals calculated for each day. In the event that a data value (e.g. flow rate measurement, TSS concentration or BOD₅ concentration) is not available for a stream, the median value for the previous calendar year for that stream is used as a surrogate number to allow completion of the calculation. The annual averages and summaries in the system-wide data tables are derived (arithmetic mean) from the monthly averages of the daily calculated mass emissions values and removal rates.

H. Annual Flow Calibration Report

The firm of MWH completed the annual Gould Flow Metering System Certification in March 2011.

POINT LOMA WASTEWATER TREATMENT PLANT 2011 Gould Flow Metering System Certification

Appendix D. Field Notes

1 INTRODUCTION

1.1 Background

The Point Loma Wastewater Treatment Plant (Pt. Loma WWTP) is located in San Diego, California, on the Point Loma peninsula, near the Cabrillo National Monument. The design capacity of this plant is approximately 240 million gallons of wastewater per day (mgd). The average daily flow (ADF) for calendar year 2011 was approximately 154 mgd. There are currently three independent flow measurement systems in place:

- 1. Gould Flow Metering System at Pt. Loma WWTP
- 2. Controlotron Ultrasonic Flow Meters at Pump Station 2 (PS-2)
- 3. ADS Ultrasonic Flow Metering System at Pt. Loma WWTP

The influent flow at the Pt. Loma WWTP is measured by four Parshall flumes at the Headworks of the Pt. Loma WWTP. There are two 6-foot flumes designated as C-1 and C-2, and two 8-foot flumes designated as N-1 and N-2. Water depth in each flume is measured by two independent meters.

Gould flow meters measure flow depth directly via hydrostatic pressure measurement. The Gould flow metering system consists of pressure transducers housed in stilling wells located adjacent to each of the Parshall flumes. The Gould flow meters measure depth of flow in the flumes, which are then converted to flow values by computer software.

At PS-2, Controlotron ultrasonic flow meters are located on each of the eight pump discharge pipes. The flows from each pump are totaled to calculate the average daily flow to the Pt. Loma WWTP.

Meters provided by ADS measure flow depth indirectly via ultrasonic measurement of the distance to the flow surface below the meter sensor (transducer) subtracted from the measured and known distance from the sensor face to the flume channel invert. The ADS flow metering system uses ultrasonic depth sensors located over each of the Parshall flumes to measure the distance from the sensors to the liquid surface being measured. The ADS software then calculates depth of flow, and ultimately daily flow, from the depth versus discharge rating curves for each flume.

Although there are three independent sources that record flow data, only flow data recorded by the Gould flow metering system is officially reported to the Regional Water Quality Control Board (RWQCB).

1.2 Purpose of Study

Every year, the City of San Diego (City) is required to provide a report of total plant flow to the RWQCB and to the United States Environmental Protection Agency (USEPA). As part of this review for calendar year 2011, V&A was retained by Brown and Caldwell to evaluate the measurement of ADF influent to the Pt. Loma WWTP and evaluate any discrepancies that may exist among the Gould, ADS and PS-2 flow metering systems.

2 SCOPE OF WORK

2.1 Scope of Work by V&A

V&A was retained by Brown and Caldwell for certification of four Gould Flow Metering devices located at the Pt. Loma WWTP. This certification includes verifying that the Gould devices are accurately recording flow, within acceptable tolerances (±5% from theoretical values), through the Parshall flumes by performing the following tasks:

- 1. Data Review and Analysis Examine existing flow data for the Gould, ADS and PS-2 metering systems. Update and analyze the flow data for the Gould, ADS and PS-2 metering systems for reporting discrepancies between the systems and report on the findings.
- 2. Field Review and Witness Inspection Perform a field review of the Gould metering system with regards to the appropriateness of the instrumentation configuration, data collection and reporting systems. Provide witness inspection and assist City personnel in performing static confirmation testing of the calibration of each Gould transducer and electronic data recording system over the full depth range of the flume using the City's test cylinder. Collect simulated flow data reported through the flow recording system located in the Engineering Building with assistance from City staff. Compare the simulated data to the theoretically calculated data of flow depth through the Parshall flume.
- 3. Draft Report(s) Prepare a Preliminary Draft Report for Brown and Caldwell's review regarding the results of the inspections together with conclusions and recommendations. The Preliminary Draft will be provided in electronic format only (i.e., no hardcopies). Brown and Caldwell will provide V&A with comments to the Preliminary Draft Report. V&A will address Brown and Caldwell's comments in developing the Draft Report that will be delivered to the City. V&A will provide three hardcopies of the Draft Report to Brown and Caldwell, two for the City and one for Brown and Caldwell's files, along with one electronic copy in PDF format.

2.2 Scope of Work by City of San Diego

The City provided the following items to assist in the completion of this work:

- 1. Daily flow data from the Gould, ADS and PS-2 flow measurement systems from January 1, 2011 through December 31, 2011.
- 2. All equipment and labor necessary to remove, test and reinstall each of the Gould transducers and suspension brackets for each of the four flumes examined.

3 REVIEW OF EXISTING DATA

3.1 Data Sources

Flow data from the City's Gould, ADS, and PS-2 flow metering systems for the 2011 calendar year is attached in Appendix A. Each monthly summary table includes the average daily flow rate (ADF), along with the maximum daily flow rate, minimum daily flow rate and standard deviation of all the daily flow rates. The yearly data that is included in Appendix B is summarized in Table 3-1. Note that the minimum value for one sensor did not necessarily occur on the same day as the minimum values for the other sensors. Likewise, the minimum percent difference may not have occurred on the same day as the minimum ADF. The same is true for the maximum values. Table 3-2 presents the percent difference for each of the metering systems for the dates on which the minimum and maximum Gould ADF values occurred.

	Averaç	ge Daily Flow (mgd)	y Flow (ADF) Percent Differ gd) (%)		
Item	Gould	PS-2	ADS	PS-2 vs. Gould	ADS vs. Gould
Days Available	359	363	321	359	317
Average	155.88	154.68	152.83	-0.77%	-1.98%
Minimum	135.46	134.83	138.47	-11.73%	-11.21%
Maximum	220.17	215.02	214.37	8.46%	18.77%
Standard Deviation	11.29	11.04	11.89	2.19%	2.35%

 Table 3-1

 Yearly Average Daily Flow Percent Difference

Table 3-2
Gould Maximum and Minimum ADF Percent Difference

Date		Average Daily Flow (ADF) (mgd)			Percent Difference (%)	
	Date	Gould	PS-2	ADS	PS-2 vs. Gould	ADS vs. Gould
Minimum	7/27/2011	135.46	141.31	140.87	4.32%	3.99%
Maximum	3/21/2011	220.17	203.93	210.55	-7.38%	-4.37%

There were a total of 44 days when the data reported by the ADS meters were known to be nonrepresentative of the actual flow values. The City was aware that there were issues with the ADS meters and communication lines for the N1, N2, and C2 flumes on those days. In order to get a clear picture of the performance of the Gould meters, the ADS data in question was omitted from this analysis. Note also that Gould data was not available six days thoughout the year due to problems with the Distributed Control System (DCS). In addition, all data from September 8th was ommitted because it was the day of a power outage throughout San Diego County and parts of Orange County, Baja California, and Arizona.

Table 3-3 compares the yearly average daily flow data for the Gould system in 2010 and 2011. It shows that the Gould system average daily flow was the same in 2010 and 2011.

Gould System Average Daily Flow (mgd)						
	2010 2011 % Change					
Average	155.88	155.88	0.00%			
Minimum	140.06	135.46	-3.28%			
Maximum	318.34	220.17	-30.84%			

Table 3-3
2010 - 2011 Gould System Average Daily Flow Comparison

3.2 Data Analysis

Using the information in Appendix A, V&A performed a graphical analysis of the daily flow data and generated Figures 3-1 through 3-5 below. Data analysis was conducted using visual and statistical procedures. The Gould flow data was used as the prime measurement for the statistical comparisons.

Comparison of flow rates reported by the flow monitoring systems occurred only at average daily flow levels. Verification of the flume rating tables was not performed as part of the test and calibration process. Due to backwater effects and flume submergence problems at flume depths below 3.0 inches, the Gould system was programmed to report zero at that minimum depth.

The percent difference of any data type between systems was calculated as follows:

PS-2 system: (PS-2 – Gould)/Gould x 100 ADS system: (ADS – Gould)/Gould x 100

3.2.1 2011 Flow Hydrograph

Plotting the ADF for each of the three measuring systems on one graph allows for a visual comparison of the three meters for the 2011 calendar year. The average daily flow recorded by the Gould flow meter varied from a minimum of 135 mgd in July to a maximum of 220 mgd in March. Figure 3-1 shows that the variance between the Gould, PS-2 and ADS flow meters was relatively constant throughout the year.

Figure 3-1. 2011 Flow Hydrograph

3.2.2 Percent Difference in Recorded Flow vs. Time (PS-2/Gould Flow Meters)

A graph of the percent difference versus time for the PS-2 and Gould measuring system for the 2011 calendar year is shown in Figure 3-2. The difference between the average daily flow recorded by the PS-2 and Gould flow meters varied from -11.73% in March to 8.46% in October.

Figure 3-2. Percent Difference in Recorded Flow (PS-2/Gould Flow Meters) vs. Time

3.2.3 Scatter Plot of Percent Difference Between PS-2 and Gould Influent Flow Meters

A scatter plot of the percent difference between the ADF reported by the PS-2 and Gould meters is shown in Figure 3-3. This figure shows that the percent difference between the two meters is relatively consistent at approximately $\pm 5\%$ for flows between 126 mgd and 220 mgd.

Figure 3-3. Scatter Plot of Percent Difference Between PS-2 and Gould Influent Flow Meters

3.2.4 Percent Difference in Recorded Flow vs. Time (ADS/Gould Flow Meters)

A plot of the percent difference in recorded flow of the ADS and Gould measuring systems versus time for the 2011 calendar year is shown in Figure 3-4. The difference between the average daily flow recorded by the ADS and Gould flow meters varied from -30.96% in March to 18.77% in January. As noted in Section 3.1, there were 44 days when the ADS meters were known to report non-representative data.

Figure 3-4. Percent Difference in Recorded Flow (ADS/Gould Flow Meters) vs. Time

3.2.5 Scatter Plot of Percent Difference Between ADS and Gould Influent Flow Meters

A scatter plot of the percent difference between the ADF reported by the ADS and Gould is shown in Figure 3-5. This figure shows that the percent difference between the two meters was relatively consistent between 0% and -5% for flows between 142 mgd and 220 mgd.

Figure 3-5. Scatter Plot of Percent Difference Between ADS and Gould Influent Flow Meters

4 FIELD TEST AND FLOW ANALYSIS

4.1 Test Set up

A static test and calibration of the four Parshall flumes and data transmitting systems was performed by Pt. Loma WWTP personnel and witnessed by V&A representatives on February 1, 2012. The following instruments, test equipment, and reports were used during the test:

- Static water well
- Gould Transducers (4 units)
- Hewlett Packard Multimeter (Model 34401A)
- Operator Station (Computer)
- Gould Transducer Calibration Reports
- Hewlett Packard Multimeter Calibration Reports

The following photos show procedure was used to test each of the four flumes (Note that Photo 4-1 and Photo 4-2 were also used in the 2010 report):

- 1. The Gould transducer was removed, cleaned and inserted into the static water well.
- 2. The transducer was connected to the multimeter, which measured the depth in converted milliamperes (mA).
- 3. The transducer was connected to the operating station for actual flow data.

Photo 4-1: Gould Transducer in Operational Configuration

Photo 4-2: Flume Access After Transducer Has Been Removed

Photo 4-3: Transducer Being Moved to Testing Well

Photo 4-4: Transducer is Inserted Into Static Water Well for Testing

Photo 4-5: Calibration Test Equipment Configuration

Photo 4-6: Hewlett Packard Multimeter

Photo 4-7: Operator Station Displays Plant Influent Readings

4.2 Test and Calibration

The Gould transducers were tested and calibrated using the Hewlett Packard multimeter shown above. The multimeter was calibrated so that a reading of 5.33 mA would correspond to 0 inches of water depth and a reading of 20 mA would correspond to 36 inches of water depth.

The transducers were linked to the Operator Station computers, located in the Pt. Loma WWTP Engineering Building. The computers calculated flow values from the mA current measurements. At the beginning of each of the four tests, the water well depth was 0 inches. The water depth was increased in 9-inch increments until it reached a full depth of 36 inches. At each 9-inch interval, a measurement of both the flow value and the multimeter reading was recorded. After reaching full depth, the water level was then reduced by 9-inch increments until the water depth was returned to 0 inches.

Table C-1, in Appendix C, compares the data collected in the field to the calculated theoretical values. The flow readings from flume C-1 at 9-inches of depth were 8% below the theoretical value. All other percent differences were less than 2% for all of the flumes. The City immediately removed the transducer from service and replaced it with one that reads correctly.

Appendix D contains a copy of the handwritten record of the flow values and the multimeter readings at each 9-inch increment.

4.3 Flow Analysis

The discharge relationship for the Parshall flumes is given by the following equation:

$$Q = Kb(H)^{n}$$
(1)
Where $n = 1.522(b)^{0.026}$
 $b = width, feet (ft)$
 $K = 4 \text{ for } b > 4$
 $H = \text{height of water flume floor, feet (ft)}$
 $Q = Flow, cubic feet per second (cfs)$
(1 cfs = 0.646 mgd)

The computer program receiving the Gould transducer readings uses the above equation to produce the output flow values. To compare the computer-generated values with the theoretical values, the dimensional widths of the Parshall flumes were obtained from design drawings provided by City personnel. The design values of 6 feet and 8 feet were used in the equation to obtain the theoretical flow values.

For C-1 and C-2, the following calculation was used to calculate the flow in mgd:

 $Q = (4)(6)(0.646)(H)^{1.594}$ = 15.504(H)^{1.594}

For N-1 and N-2, the following calculation was used to calculate the flow in mgd:

 $Q = (4)(8)(0.646)(H)^{1.607}$ $= 20.672(H)^{1.607}$

5 CONCLUSIONS AND RECOMMENDATIONS

5.1 Conclusions

- 1) No major discrepancies were found between the Gould and PS-2 metering devices for the 2011 calendar year. Comparison data for the Gould and ADS meters was not available for a total of 44 days during the year, but the non-representative data does not impact the results of this analysis.
- 2) Instrumentation test set-up, data collection and reporting systems meet the requirement directed by Brown & Caldwell.
- Based on the existing data, it is certified that the Gould meters are recording flow accurately and within ±5% of the calculated theoretical values.
- 4) The percentage differences between the theoretical and practical flow for each of the flows are within ±5% of one another and show no distinctive variance above or below the average daily flow.
- 5) The three flow metering systems generally provide comparable results, considering the limits of the technologies used.

5.2 Recommendations

1) V&A recommends that the City continue to use Gould transducers as their primary flow measuring devices.
