**APPLICATIONS:**

- Where sufficient surface area is not available for biofiltration swales, suspended pavement provides street tree installations adequate root-zone soil volume for the proposed street trees and stormwater/capture treatment.

**BENEFITS:**

- Provides a high level of treatment for a wide variety of pollutants
- Reduction in runoff volume through retention in the soil in the suspended pavement and uptake by the tree, along with limited infiltration where allowable.
- Can be combined with permeable sidewalk pavement for additional interception of stormwater.
