SECTION 1 PURPOSE AND BACKGROUND

1.1 Purpose of 2010 Recycled Water Master Plan Update

Per San Diego Municipal Code (Chapter 6, Article 4, Division 8), the City shall prepare and adopt a Recycled Water Master Plan (RWMP) to define, encourage, and develop the use of reclaimed water within its boundaries. The RWMP shall be updated every five years. The last update was completed in 2005 (Recycled Water Master Plan Update 2005). This 2010 RWMP Update is completed in conjunction with the ongoing City of San Diego (City) Recycled Water Study.

The Recycled Water Study (scheduled to be complete by Fall 2011) will provide recommendations for future water reuse projects that offload PLWTP and maximize recycling. The Recycled Water Study recommendations will likely include a blend of non-potable reuse and indirect potable reuse (IPR) projects. However, the ability and intent to implement indirect potable reuse projects will not be fully determined until the City's Water Purification Demonstration Project (Demonstration Project) is complete in 2012. Therefore, the Demonstration Project is an important project in relation to the region's future approaches to reuse.

The purpose of this 2010 RWMP Update is to evaluate opportunities to maximize non-potable reuse if IPR projects are not pursued. This 2010 RWMP Update describes the existing non-potable system and near-term expansions (through 2015), and identifies potential long-term non-potable reuse expansion concepts. Implementation of future non-potable reuse concepts beyond already planned expansions through 2015 is pending the findings of the Demonstration Project as summarized on Figure 1-1 (see Section 6 for further discussion).

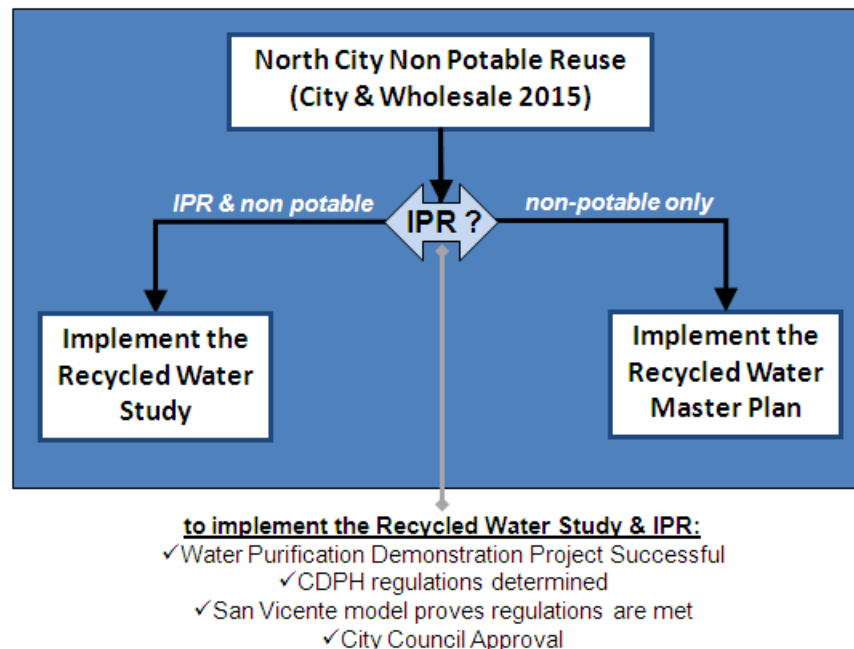

Figure 1-1. Non-potable Reuse Decision Tree.

The Demonstration Project, San Vicente reservoir modeling, State regulations and Council approval are key steps in determining the approach taken to develop recycled water projects in the future

The 2010 RWMP Update is organized into the following sections:

- Section 1 – Purpose and Background
- Section 2 – Baseline Recycled Water System
- Section 3 – Recycled Water Supply
- Section 4 – Initial Market Assessment
- Section 5 – Distribution Expansion Opportunities and Refined Market Assessment
- Section 6 – Implementation Plan
- Section 7 – References

This section presents background information on the history of the water reuse program (including the need for a local supply resource and wastewater management), and the Recycled Water Study currently in development.

1.2 History of Water Reuse Program

The City has been a pioneer in the field of water recycling. In 1981, the 25,000-gallon per day Aqua I pilot aquaculture plant began operation in Mission Valley with the water produced used to irrigate a sod farm adjacent to Jack Murphy Stadium (now Qualcomm Stadium). In 1984, the Aqua II Water Reclamation Facility, a second, larger pilot research installation, began treating 180,000 gallons per day of wastewater. This water was sold to the California Department of Transportation (CalTrans) for use in irrigating freeway landscaping beginning in 1987. In 1991, the Aqua III Water Reclamation Facility and Aqua 2000 Research Center were located in the San Pasqual Valley, north of the community of Rancho Bernardo, where the Aqua III plant continued to use aquaculture treatment to reclaim wastewater. This facility had the capacity to treat 1 million gallons per day (mgd) for agricultural use and irrigation. The Research Center continued to study the concept of advanced water treatment and potable reuse using a variety of treatment methods until 2001 when the project was discontinued.

In 1997, the North City Water Reclamation Plant (NCWRP) was completed, and the City has been delivering recycled water to customers for irrigation and industrial use on a larger scale. In 2002, the South Bay Water Reclamation Plant (SBWRP) was completed, and in July 2006 began delivery of recycled water to the International Boundary and Water Commission (IBWC), followed by Otay Water District and CalTrans at later dates. The amount of water reused has reached the current total of approximately 10.9 mgd (annual average for 2009 and 2010) to retail customers within the City's service area, as well as outside agencies (or wholesale customers).

The City has made significant progress in expanding recycled water use based on the framework outlined in previous planning efforts. Key planning studies that have guided recycled water system expansions include the *2000 Updated Water Reclamation Master Plan (Northern and Central Service Areas)*, *2005 Recycled Water Master Plan Update*, *2005 South Bay Recycled Water Feasibility Study* and *2006 Water Reuse Study*. An overview of the key findings from these studies are provided in Section 1.3.2 and Appendix A.

Since these reports were developed, the City completed Phase I of the Northern Service Area recycled water system expansion in 2005, and the Phase II expansion is in various stages of completion with plans to complete all projects by 2015. In addition, City staff has actively pursued connecting the potable water use sites identified as Tier 1 customers (demands greater than 20 acre-feet per year (AFY)). Eight of the nineteen sites, located adjacent to the existing recycled water distribution system, are now being served by recycled water. Several more are in the plan review stage.

In South Bay, staff has worked on project planning to serve potential customers identified in the 2005 South Bay Recycled Water Feasibility Study and potential pipeline extension projects to serve facilities in the Southern Service Area region.

The following discussion briefly recounts some of the key historical events that initiated the recycled water program.

1.2.1 Recycled Water as a Local Water Supply Resource

Most of the City's existing water supply is imported water from the Colorado River and the California State Water Project. Because of this, the City has long recognized the need to develop local water supplies to balance and reduce the dependence on imported water. A diversified water "portfolio" would provide the City needed reliability and local control of its water supply. In 1997, the City prepared the Strategic Plan for Water Supply, a significant initial effort at documenting the diversification needed to address water supply needs through 2015. This report was updated with the more detailed Long-Range Water Resources Plan (Long-Range Plan), completed in 2002, outlining a phased approach to satisfy water supply needs through 2030. The Long-Range Plan recommended that the City develop and use recycled water to meet future demands and outlined specific goals for recycled water supply through 2030.

The need for local water supply development has been echoed by the San Diego County Water Authority (SDCWA), and their 2009 Annual Water Supply Report shows plans to increase local supplies (including recycled water) for 40 percent of regional demands by 2020. In order to support this goal, the SDCWA offers grant funding to its member agencies to study the development of local resources.

In 2009, the California State Water Resources Control Board (SWRCB) adopted a recycled water policy aimed at increasing recycled water usage, minimizing carbon footprint, and promoting sustainable management of surface and groundwater resources. The policy lists the following primary goals:

- Increasing recycled water usage over 2002 levels by one million AFY by 2020 and by at least two million AFY by 2030;
- Increasing stormwater usage by at least half a million AFY by 2020 and at least one million AFY by 2030;
- Increasing water conservation in industrial and urban uses by 20 percent by 2020; and,
- Substitution of as much recycled water for potable water as possible by 2030.

Although increased conservation and use of stormwater is planned, the thrust of the policy is to increase the use of recycled water from municipal sources in a manner that complies with California Title 22, and all other applicable state and federal water quality laws and regulations. The policy describes criteria intended to streamline and generate consistency in the permitting of recycled water projects. Topics addressed by the policy include the following:

- Salt and nutrient management plans for groundwater basins and watersheds;
- Streamlined permitting for landscape irrigation projects that use recycled water;
- Recycled water groundwater recharge projects;
- Antidegradation of water quality;
- Contaminants of emerging concern; and,
- Incentives for the use of recycled water.

In 2009, the SWRCB also adopted the General Waste Discharge Requirements for Landscape Irrigation Uses of Municipal Recycled Water. This general permit streamlines the permitting process for use of disinfected tertiary recycled water from municipal sources for landscape irrigation projects. Such irrigation projects

include parks, greenbelts, school yards, athletic fields, golf courses, and several other public access areas. The general permit requires that the recycled water meet certain treatment and use standards for protecting public health and the environment.

1.2.2 Recycled Water and Wastewater Management

In addition to a critical water supply need, wastewater management also drives the need to maximize local water recycling. Since 1963 the City has treated its wastewater at the Point Loma Wastewater Treatment Plant (PLWTP), which provides advanced primary treatment before disposal via an ocean outfall. In 1972, the federal Clean Water Act (CWA) was adopted which requires that wastewater plants provide a minimum of secondary treatment. Section 301(h) of the CWA allowed facilities that discharge to certain marine waters to apply for a modified National Pollutant Discharge Elimination System (NPDES) permit, waiving secondary treatment requirements. The City originally applied for the modified permit, but then withdrew it. In 1987, the U.S. Environmental Protection Agency (USEPA) and environmental groups sued the City for not meeting the provisions of the CWA. The Ocean Pollution Reduction Act (OPRA) was passed in 1994 to allow San Diego to reapply for the modified permit. The lawsuit was resolved later that year when the modified permit was granted, saving the City an estimated \$3 billion in avoided capital costs for additional secondary treatment facilities.

As part of the application for a modified NPDES permit, the City committed to implementing a water reclamation program that would create a system capacity to treat 45 mgd by 2010. The City has fulfilled the treatment capacity requirement with the completion of the 30 mgd NCWRP in 1997 and the 15 mgd SBWRP in 2002. A 1995 federal court order further required the City to construct an “optimized recycled water distribution system” in conjunction with building the NCWRP. The majority of the distribution facilities that comprise the optimized system were installed between 1995 and 1998 to enable delivery of recycled water upon completion of the reclamation plant.

The USEPA provided a grant that helped fund the construction of the NCWRP. Conditions of the grant award are quoted as follows:

Upon certification of the NCWRP, flows into the plant will constitute a minimum of 75 percent of the plant's design capacity (i.e. at least 22.5 mgd). Of these flows the City will beneficially reuse at least 10 percent upon certification and shall attempt to meet the following goals:

- a. Beneficial reuse of 25 percent of the flows treated at the NCWRP by December 31, 2003.*
- b. Beneficial reuse of 50 percent of the flows treated at the NCWRP by December 31, 2010.*

Based on anticipated flows, the City established reuse goals of 6 mgd by the end of 2003 and 12 mgd by the end of 2010 to fulfill the USEPA grant goals.

Presently, NCWRP treats 22.5 mgd (75 percent of capacity) of wastewater to secondary standards. The requirement to reuse 10 percent of the treated flows was achieved in 1998, when about 2.4 mgd of recycled water was distributed. Currently, approximately 7.2 mgd of recycled water is beneficially reused, which is planned to increase to 10.4 mgd by 2015. Through the distribution system expansion (Phase I completed, Phase II planned or under construction), parkland/open space retrofits, and by requiring developers in the NCWRP service area to construct recycled water conveyance systems to new developments, the City has diligently pursued the fulfillment of the water reuse goals.

Regarding the City's application for a new modified NPDES permit in 2000, disagreements arose as to the interpretation of OPRA, primarily over the quantity of suspended solids that could be discharged from the PLWTP into the Pacific Ocean. These disagreements were the subject of two administrative appeals to the Environmental Appeals Board and a lawsuit. The City appealed the USEPA's application of OPRA to the

new modified permit, which would require the City to continue to reduce the quantity of suspended solids each permit period and continue to attain at least 58 percent removal of the biochemical oxygen demand (BOD). Three environmental groups also appealed the new modified permit on a number of issues, including that the quantity of suspended solids should be reduced further. In addition, an environmental group filed an action in Superior Court of San Diego County challenging the State Board's reinstatement of the 15,000 metric tons per year limit of total suspended solids (TSS). The Superior Court challenge was dismissed and all appeals were stayed as the parties agreed to discuss possible alternative solutions to the OPRA issues. The parties met regularly from January 2003 to March 2004 and agreed on a Settlement Agreement and Joint Stipulation for Withdrawal of Appeals. The Settlement Agreement commits the City to (a) evaluate improved ocean monitoring, (b) pilot test biological aerated filters as a form of technology to increase solids removal, and (c) study increased water reuse.

In 2008, the USEPA made a decision to grant the City San Diego a modification to its NPDES permit. The permit modification allows the City to continue to operate the PLWTP as a chemically-enhanced primary treatment facility for five years rather than requiring an upgrade to secondary treatment. The permit modification must be renewed every five years. Members of the environmental community (San Diego Coastkeeper and the San Diego Chapter of the Surfrider Foundation) have traditionally opposed past permit modification issuance, advocating the conversion of the PLWTP to full secondary treatment and thereby reducing solids loading into the ocean. However, during the 2008-2010 permit modification process and in lieu of such opposition, San Diego Coastkeeper and the San Diego Chapter of Surfrider Foundation entered into a Cooperative Agreement (Agreement) with the City to conduct the Recycled Water Study. In accordance with the Agreement, both of these organizations provided their support to the USEPA's decision to grant the permit modification. The City's responsibility per the Agreement is to execute the Recycled Water Study.

1.3 Overview of Recycled Water Study

The purpose of the Study is to evaluate non-potable and indirect potable reuse opportunities to meet the City and project stakeholder goals through a 2035 planning horizon. These goals vary, and are not always consistent amongst stakeholders. The study process aims to address these shared and differing goals by developing various project alternatives, developing associated costs and benefits, and facilitating informed decision making through work sessions and status update meetings. Developing the projects and the overall plan is based on two fundamental principals summarized below.

1. Projects (especially the early phase projects) must have enough technical information to determine that they appear feasible, safe, and provide a valuable local water resource. Projects must be defined to the point that comparative costs and benefits can be developed.
2. The plan must address the PLWTP benefits associated with the environmental community's goal of reducing flows treated at the PLWTP by maximizing the use of recycled water, reducing solids loading into the ocean, and meeting the City and Participating Agency's (PAs) goal of managing Metropolitan Sewerage System capital and operations and maintenance (O&M) costs.

The City has one recycled water system that consists of the Northern and Southern service areas. Expansion of the recycled water system has the potential to offload the PLWTP. The Study will consider recycling options throughout the region.

1.3.1 Recycled Water Study Project Components

The Study includes a number of technical evaluations and coordination steps to identify and evaluate reuse alternatives within the City as well as areas served by the Participating Agencies. Throughout the study, regular stakeholder briefing sessions are held to present progress and to receive input and feedback on the

activities. A series of technical memoranda are being developed (as described below) to document information and project progress. The Study also includes work sessions. The Framework Planning Session was held in February 2010 and is summarized in TM 3, and the Coarse Screening Session was held in August 2010 and is summarized in TM 6. The Fine Screening Session, which was held October 19, 2010, is summarized in TM 7. These efforts will be encapsulated into a final recycled water study report.

1.3.1.1 Technical Memorandum Overview

The Recycled Water Study will consist of eight Technical Memoranda and one comprehensive report. The eight TMs and the Study Report are being forwarded to project stakeholders for review and comment as they are completed. The title of each TM and a brief description are provided below.

- **TM No. 1: Non-potable Reuse Market Assessment.** Non-residential market assessment within the City of San Diego limits are examined, including irrigation customers as well as cooling towers, car washes, and laundromats. Furthermore, discussions on potential demands offered by individual PAs are included. (Final Submittal: September 2011)
- **TM No. 2: Regional Non-potable Reuse Recycled Water Demand.** Non-residential market demands within the PAs of the Metropolitan Sewerage System are assessed but limited to information received from PAs on questionnaires distributed by the Study Team. (Final Submittal: September 2011)
- **TM No. 3: Framework Planning.** A summary of the Framework Planning Session held to align the City and consultant team on key project issues, processes, and future steps. (Final Submittal: April 28, 2010)
- **TM No. 4: Wastewater Supply and Treatment.** Discussion of projected recycled water supplies within the Metropolitan service area and examination of various treatment technologies. (Final Submittal: October 8, 2010)
- **TM No.: 5 Recycled Water Demand and Delivery.** Evaluation of the projected recycled water demand and the various methods of delivery. (First Submittal: June 8, 2011)
- **TM No. 6: Coarse Screening.** A summary of the Coarse Screening Session where project components will be narrowed down. (Final Submittal: December 22, 2010)
- **TM No. 7: Fine Screening.** A summary of the Fine Screening Session where final solutions and steps needed to move ahead will be discussed. (Final Submittal: February 15, 2011)
- **TM No. 8: Revenue and Financials.** An evaluation of the proposed project components based on cost. (First Submittal: August 2011)

1.3.1.2 Study Stakeholders

The stakeholders for this project are comprised of the San Diego Coastkeeper, the San Diego Chapter of the Surfrider Foundation, and the PAs of the Metro Wastewater Joint Power Authority (Metro JPA), who have capacity rights in the Metropolitan Sewerage System pursuant to the provisions of the 1998 *Regional Wastewater Disposal Agreement Between the City of San Diego and the Participating Agencies in the Metropolitan Sewerage System*. San Diego County Water Authority (SDCWA), the agency that has primary responsibility for water supply planning efforts, and Independent Rates Oversight Committee (IROC) are also stakeholders in the Study. SDCWA representative provides regular updates on SDCWA activities related to the Study. These updates include data from neighboring agencies, issues and guidelines related to brine management, and policies related to Constituents of Emerging Concern (CEC).

1.3.1.3 Communication with Stakeholders

In order for the Study successfully achieve its goals and objectives, effective communication between all stakeholders is critical. Therefore, the Technical Memoranda will be submitted to the stakeholders for review

and comment. In addition, the City is conducting a series of Status Update Meetings (held every two months) and workshops with the stakeholders to facilitate further discussion of the TMs and receive further input for consideration.

1.3.2 Related Studies

The City has conducted numerous studies that provide information relevant to the development of the Recycled Water Study. The following is a listing of some of the key studies that have been reviewed.

- **Updated Water Reclamation Master Plan (Northern and Central Service Areas), December 2000 –** Market assessment and identification of distribution system expansion alternatives. Phase I and Phase II included expansion of the North City recycled system to the north on Black Mountain road and then west into Carmel Valley. Phase III included recycled water service to the Rancho Bernardo area.
- **City of San Diego Recycled Water Master Plan Update, September 2005 –** This was the City's five year update of their Recycled Water Master Plan to fulfill the requirements of the San Diego Municipal Code. The study included a market assessment that focused on capturing infill customers near the existing North City Water Reclamation Plant (NCWRP) distribution system infrastructure. Potential customers in this area were separated into tiers based on their water demand and proximity to the existing recycled water pipelines. Approximately 22 potable water customers were included in the Tier 1 group because their individual water demand was over 20 acre-feet per year (AFY) (0.018 million gallons per day (mgd)) and they were located adjacent to an existing or planned recycled water pipeline. The market assessment also identified potential customers in the existing Southern area and potential new areas such as Central and the San Pasqual areas. Expansion of the Northern Service Area (Phases I & II), previously approved by City Council continued. However, Phase III of the Master Plan was not pursued due to the fact that in 2007 elected officials choose to pursue NC-3 of the Water Reuse Study.
- **South Bay Recycled Water Feasibility Study 2005.** This study provides an analysis with recommendations for supplying recycled water to the South Bay area, including the Southern Service Area, IBWC, Otay Water District, Sweetwater Authority, CalTrans irrigation, and the Bajagua Recycled Water Project. The report analyzes the existing system supply for the SBWRP, capacities, and hydraulics. It presents alternative alignments and scenarios for serving potential users, and includes project phasing and cost estimates. The study concludes that additional recycled water capacity will be needed as the Otay Water District system expands and the demand increases. Another option is to sell recycled water to the Bajagua Recycled Water Project in Mexico.
- **Water Reuse Study Final Report 2006.** This study was completed in conjunction with the 2005 Recycled Water Master Plan Update. Several strategies for increased use of recycled water within the region were explored. The study involved input from various sources including an assembly of key stakeholders comprised of community leaders, policy makers, water consumers, business leaders and other professionals. An independent advisory panel of renowned experts in related fields was contracted through the National Water Research Institute. Public viewpoints were solicited through community meetings, focus groups and telephone/online surveys. The study includes an evaluation of six strategies integrating non-potable reuse and indirect potable reuse opportunities for the North, Central and South Service Areas. Option NC-3 was preferred by the stakeholders, which included infilling non-potable demands in the existing non-potable North City system, followed by an indirect potable reuse project utilizing San Vicente Reservoir. For the South Bay, SB-1 (a limited non-potable approach serving a majority of non-potable water to the Otay Water District and Sweetwater Authority) and SB-3 (an indirect potable reuse project utilizing Lower Otay Reservoir) were supported. SB-1 support was predicated on proceeding with NC-3. In December 2007, elected officials directed City staff to develop a plan for implementation of the NC-3 strategy which included, but was not limited to, a indirect potable reuse demonstration project (R-303095).

- **2015 Projections.** Non-potable Reuse Demand Forecast through year 2015.
- **Indirect Potable Reuse (IPR) Water Purification Demonstration Project.** The Water Purification Demonstration Project is the second phase of a process evaluating ways for the City to increase its use of recycled water. The first phase was the City's 2006 Water Reuse Study that identified reservoir augmentation as the preferred option for developing recycled water sources. The Water Purification Demonstration Project will determine if reservoir augmentation is a feasible option for San Diego. Reservoir augmentation is a multi-step process that includes:
 - Using advanced water purification technology on highly treated wastewater
 - Sending the purified water to a reservoir to blend with existing water supplies
 - Treating the blended water again to be distributed as drinking water
- **Water Facilities Master Plan.** Prioritized Water Facility Needs, 20-year CIP. The facility needs are determined based on operational and condition deficiencies.
- **Metropolitan Wastewater Plan.** Wastewater Facility Needs. Provides guidance for establishing a CIP program that is tied to San Diego Regional Planning Agency (SANDAG) flow projections and current Mass Emission Rate permit conditions. This Plan also includes a list of projects that are driven by a condition assessment program that is currently conducted by the Public Utilities Department.
- **San Pasqual Conjunctive Study.** This study evaluates the basin ability to store water and withdraw at a later time.
- **Tijuana Basin Aquifer.** Examines the feasibility of using the Tijuana Valley Alluvial Aquifer as a potential aquifer storage and recovery system to seasonally store recycled water.
- **Pilot Wells.** The pilot production well investigation evaluates the potential of ground water basins within the City's jurisdiction for water supply production potential for each basin for a new local water supply source.
- **Urban Water Management Plan (UWMP).** In accordance with the California Urban Water Management Planning Act, all California agencies providing water to more than 3,000 customers or more than 3,000 acre-feet of water per year are required to update their UWMP every five years and submit them to the Department of Water Resources. The UWMP looks at the City's historic and current water use projections and compares water supplies with demands over the next 20 years. The plan identifies the imported and local water supplies that will meet future demands including groundwater recovery and water recycling, as well as City's current and planned conservation measures. This helps to ensure that the City can provide a reliable supply of high-quality water to meet current and future demand.
- **Recycled Water Pricing Study.** The City commissioned Raftelis Financial Consultants (RFC) to conduct the Recycled Water Pricing Study. The purpose of the study is to review all financial aspects of the recycled water operations and capital program to:
 - Calculate the true cost of producing and distributing recycled water
 - Recommend a pricing structure that recovers all costs associated with producing and distributing recycled water
 - Review alternative rate structures to encourage recycled water demand
 - Determine appropriateness and amount of revenue and expenses that should be shared among potable water, wastewater and recycled water programs and the resultant impacts on customers
 - Develop a user-friendly computer Pricing Model that could be used to model rates in future years and train City staff to use it

The Pricing Study includes extensive review of the current and projected recycled water demands, operating and capital expenses, and policy issues related to allocation of costs among recycled water, water and wastewater enterprises.

- **Recycled Water Study Participating Agency Options (July 2010 Draft).** This document was prepared by the Metro JPA Technical Advisory Committee (Metro JPA TAC) to present additional options to be considered as part of the Recycled Water Study. Options and ideas are presented to expand recycled water in the northern, eastern, and southern areas of the region. The City provided a response letter to the Metro JPA TAC on August 17, 2010 to discuss how these options have been addressed or will be addressed in the Recycled Water Study. The Metro JPA TAC will be providing an updated, final version of these options in the near future, which will be retitled as *Regional Opportunities to Reduce Flows at Point Loma Wastewater Treatment Plant*, as noted in the Metro JPA TAC response letter dated September 9, 2010.

This page intentionally left blank.

SECTION 2 BASELINE RECYCLED WATER SYSTEM

This section describes the City's baseline recycled water system within the context of this analysis, and is based on technical memorandums (TMs) 1 and 2 prepared as part of the Recycled Water Study. The baseline recycled water system is defined as existing (2010) facilities and demands, as well as any planned expansions of the distribution system through 2015. Given the long-term focus of the Recycled Water Study to optimize water reuse, the already planned near-term expansions of pipelines and additional customers are considered part of the baseline system.

The City's recycled water system serves two main areas, with each area supplied by a reclamation facility. The Northern Service Area (NSA) is supplied with recycled water from the NCWRP, and the Southern Service Area (SSA) is supplied with recycled water from the SBWRP. The recycled water system was originally planned to consist of four independent recycled water service areas: the North City Service Area, the San Pasqual Service Area, the Central Service Area, and the South Bay Service Area. Currently, only the NSA and the SSA have been built. In this 2010 RWMP Update, discussion of NSA includes the Northern Service Area, the Central Service Area and the San Pasqual Service Area, while the SSA consists solely of the South Bay Service Area. Figure 2-1 shows the boundaries of the recycled water service areas.

The following subsections describe the two recycled water service areas within the City, which includes existing as well as near-term, planned expansions to the service areas that will be developed by 2015.

2.1 Northern Service Area

The NSA is supplied with recycled water from the NCWRP. As of 2009, the NSA consists of 83 miles of pipeline within San Diego that distributes recycled water to retail customers in the City and two wholesale customers: the City of Poway (Poway) and Olivenhain Municipal Water District. Discussion of the NCWRP is covered in Section 3.1.1.

2.1.1 Existing Northern Service Area Recycled Water Customers

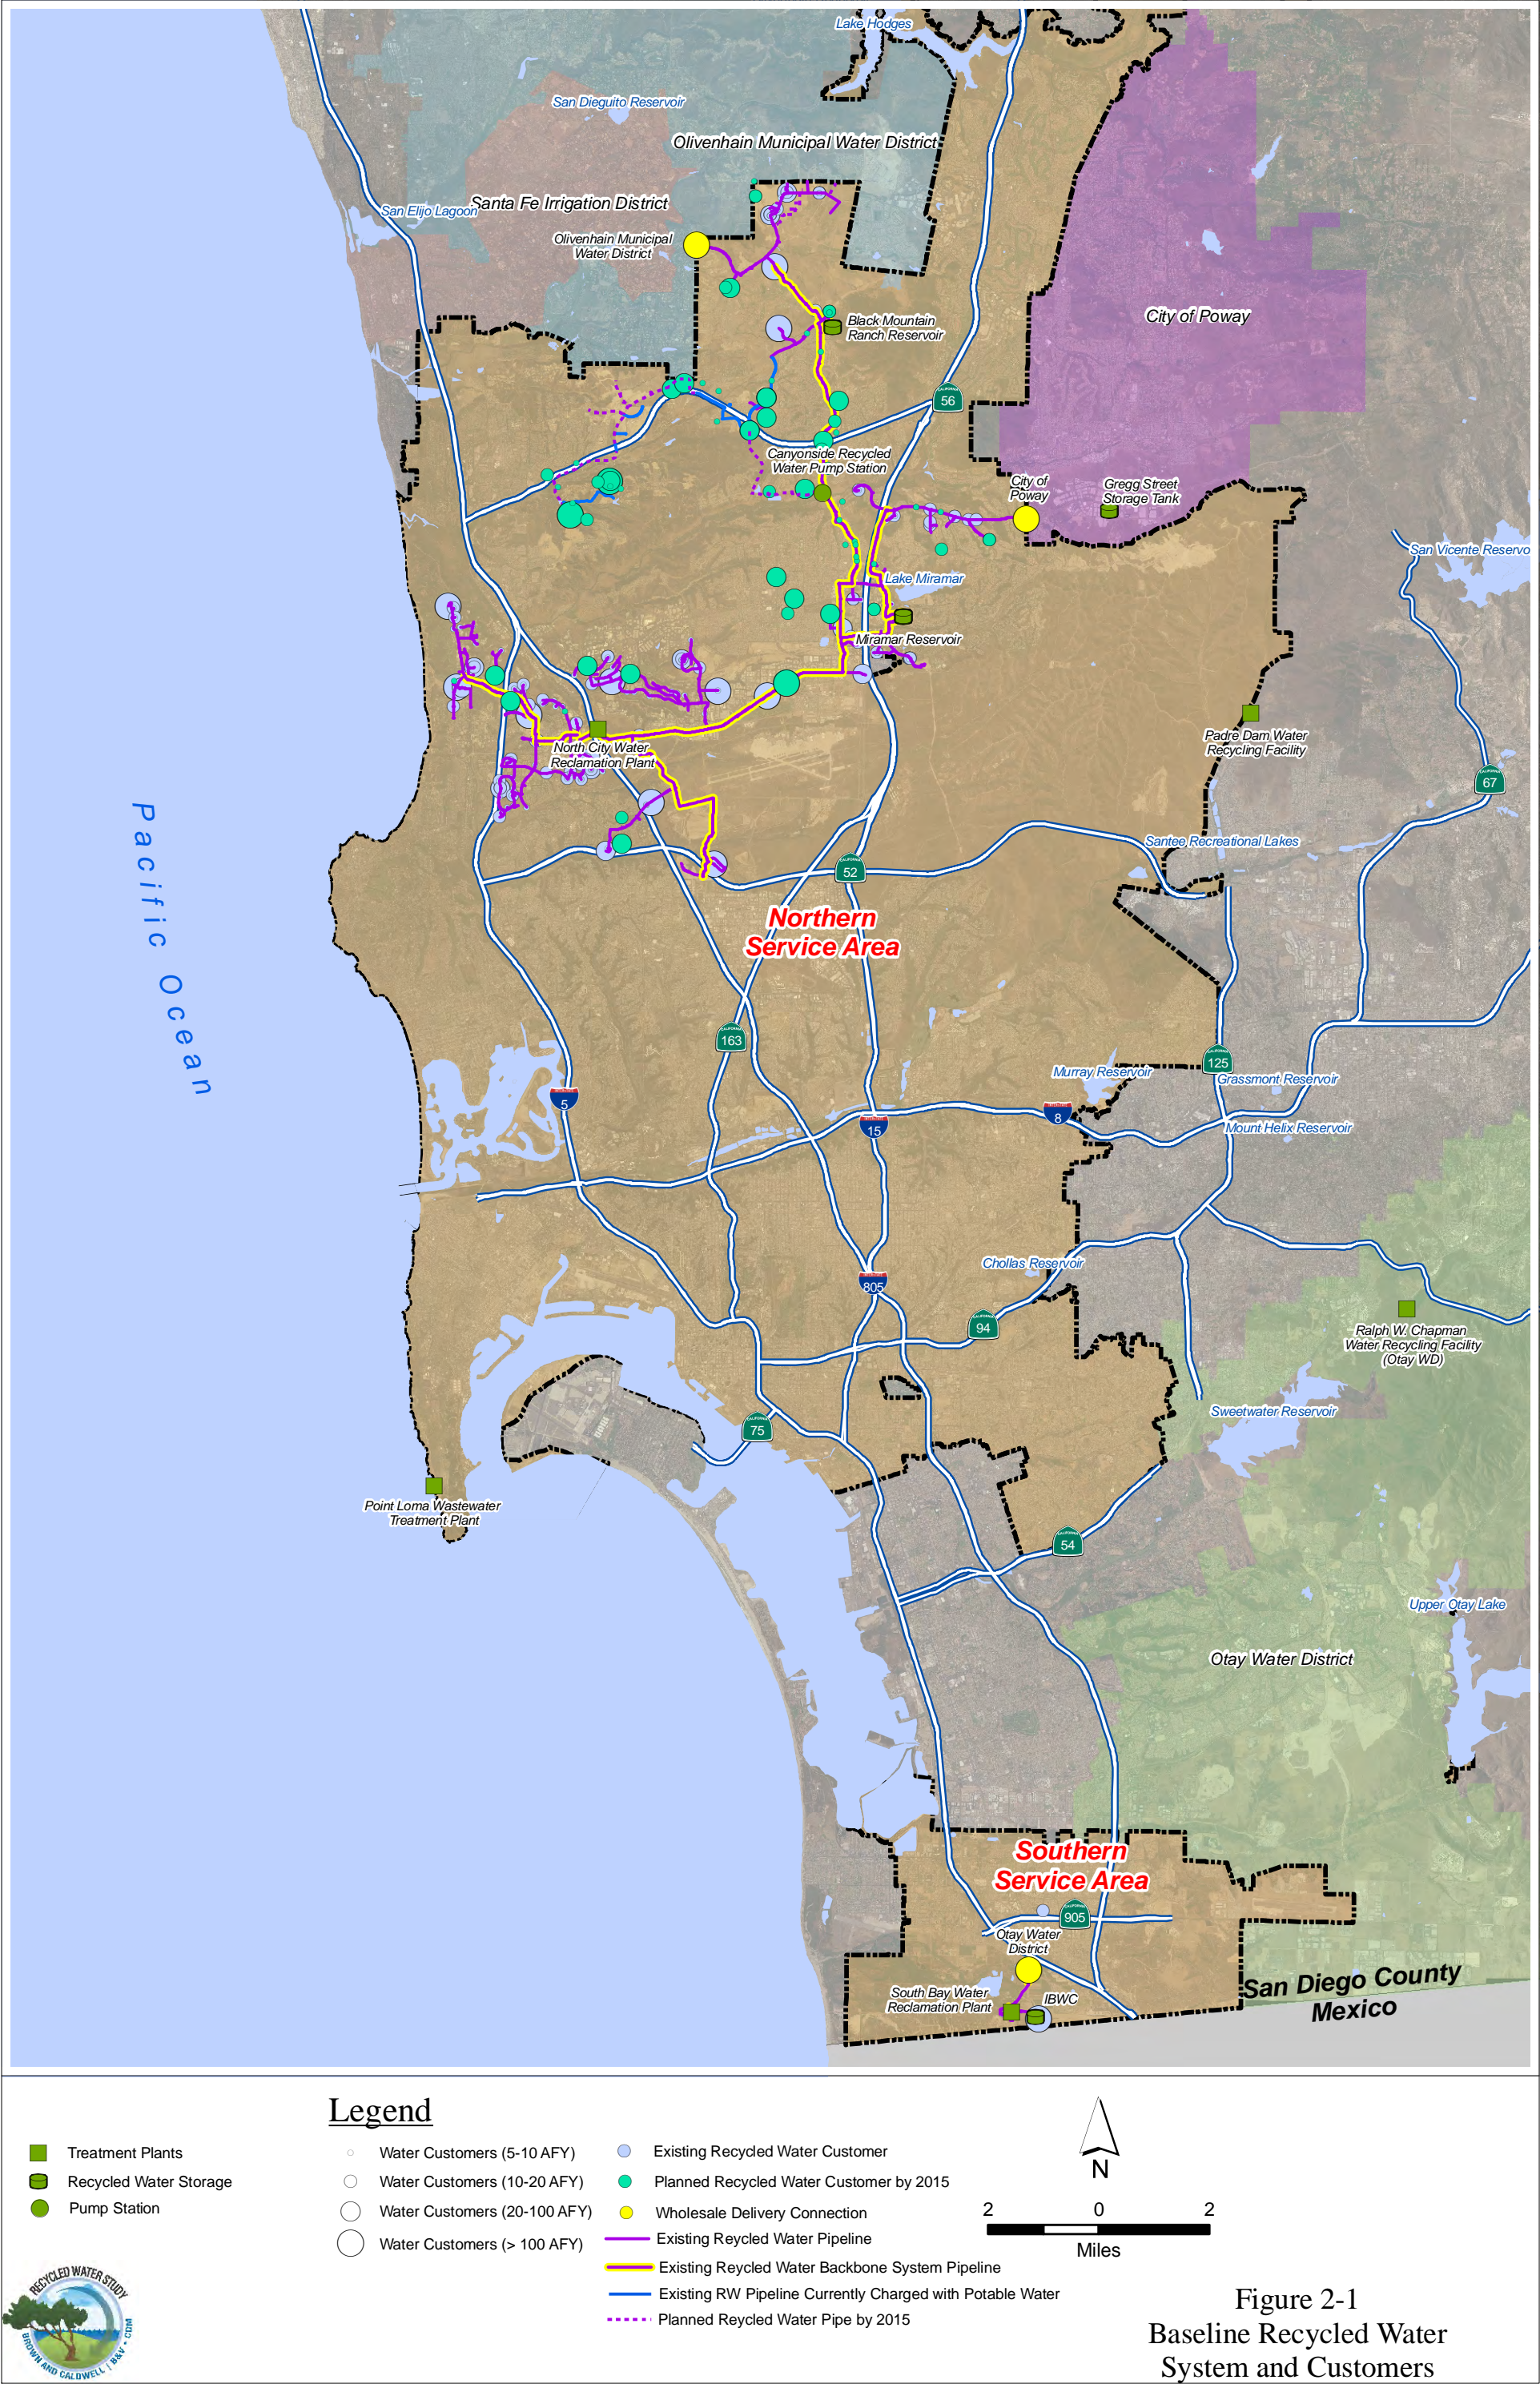

Figure 2-2 presents the historical recycled water usage served by NCWRP. As shown, recycled water use has typically increased since 2005 with the addition of several meters. There was a decline in 2010 usage, however, primarily due to weather impacts and potentially some conservation. Weather can significantly change outdoor irrigation demands where demands are typically higher in dry, hot conditions and lower in cool, wet conditions. In 2010, the San Diego area experienced cooler summertime temperatures (approximately five degrees cooler than normal between the months of June and August) and annual precipitation that was slightly higher than normal. Another factor that may have influenced demand is increased water conservation and drought restriction messaging. Although recycled water use is exempt from drought restrictions, it is possible that some customers reduced water use through more efficient irrigation. Given the fluctuations in demands, an average of calendar year (CY) 2009 and 2010 demands are presented as existing demands when discussing overall NSA demands.

Since 2005, the number of retail recycled water meters for the NSA has increased from 358 to 505 customers as of CY 2010. Approximately 40 of the meters added from December 2007 to December 2010 were City meters on public property. The total existing retail demands for the NSA are 4,386 AFY, and a summary of the top 10 retail recycled customers as of CY 2010 is shown in Table 2-1.

This page intentionally left blank.

9	University of California, San Diego (UCSD)	87	0.1
10	City of San Diego - Environmental Services	76	0.1
Total Beneficial Reuse for Top 10 Retail Customers		2,635	2.4

Source: City of San Diego Public Utilities Department Recycled Water Program Staff

Note: Demands for top 10 customers are based on approximately 80 meter connections.

AFY: acre-feet per year

mgd: million gallons per day

HOA: Homeowner association

Approximately 99 percent of the retail and wholesale customers use the water for irrigation, while the remaining customers use the water for cooling towers. Table 2-2 lists the City's existing customers that currently use recycled water in their cooling towers and the four additional facilities are listed that have a recycled water connection for cooling towers, but are currently using potable water.

Table 2-2. Existing Cooling Towers with Recycled Water Connection

Wholesale Customers

Olivenhain Municipal Water District (OMWD) and the City of Poway (Poway) are the City's two existing wholesale customers served by the Northern Service Area. In addition to these two existing wholesale customers, the Santa Fe Irrigation District has expressed interest in purchasing up to 850 AFY of recycled water from the City. However, the Santa Fe Irrigation District demands are not included in the baseline estimates since, if implemented, water purchases would not take place before the 2015 timeframe. Baseline demands were obtained from surveys and coordination with participating agencies (PAs). Refer to Section 4.3.4, Participating Agency Surveys for the basis of the numbers.

Olivenhain Municipal Water District. OMWD has two connections to the City's Northern Service Area. In CY 2009/2010, OMWD used 642 AF of recycled water and the City is anticipating that they will use a total of 1,100 AFY by 2015 (additional amount of 458 AFY). OMWD's agreement with the City for the original connection (on San Dieguito Road) is 400 AFY through 2019 and then reduces to 300 AFY up to 2024. The second connection is not covered by the agreement.

Poway. Poway is currently served by an existing connection to the southern portion of Poway and used 428 AF in CY 2009/2010. Poway's existing agreement with the City allows for the purchase of up to 750 AFY; the City has assumed that they will increase their usage by 323 AFY by 2015 to achieve the agreement amount. In their survey response (refer to Section 4.3.4), Poway indicated that their current usage rate (428 AFY) would not increase. This is because their recycled water demands are in North Poway (developed as part of the Rancho Bernardo non-potable reuse option) and not served by the existing connection to South Poway. However, the City is including the contract amount as the baseline for planning purposes.

2.1.2 Northern Service Area Expansions (Planned by 2015)

As part of the Phase II expansion evaluated in previous Recycled Water Master Plan Updates (2000 and 2005), the City plans to expand the NSA through the installation of three distribution mains: the Carmel Valley pipeline, the Camino del Sur pipeline, and the Los Penasquitos pipeline. The pipelines will convey recycled water from the NCWRP to supply non-potable demands near Highway 56 (Ted Williams Freeway), between I-5 and I-15. The three additional pipelines have a combined length of eight miles. The majority of

demand will be serviced by the Carmel Valley pipeline, with the additional two pipes to be constructed to connect the Carmel Valley pipeline to the existing system. Construction on a portion of the Carmel Valley pipeline commenced in September 2010 and is expected to be complete by November 2011. As part of this segment, construction of the Pacific Highlands pipeline is currently underway and is being completed through a participation agreement with the developer. The Los Peñasquitos pipeline had been delayed due to environmental issues but was recently approved to move forward and has an estimated completion date of January 2013. The Camino del Sur pipeline has been delayed due to environmental issues associated with vernal pools and slowed development in the area as the project had included a participation agreement with a local developer. Demands along the Carmel Valley pipeline can be served temporarily through the alternative northerly conveyance route. However, this is costly due to the pumping needs and is not preferred for long-term operations.

Along with the three recycled water mains, four pipeline extensions are expected to be constructed by 2012: Westview Parkway Extension, Black Mountain Road Pipeline Extension, Park Village Extension, and Pacific Highlands. A summary table of the planned recycled water pipelines is shown in Table 2-3. Refer to Figure 2-1 for the existing and planned recycled water distribution system and existing and planned recycled water customers with demands 5 AFY or greater.

Table 2-3. Additional Recycled Water Pipelines by 2015		
	Project Name	Approximate Schedule
Phase II Pipelines	Carmel Valley Recycled Water Pipeline	Construction September 2010- November 2011
	Camino del Sur Recycled Water Pipeline	Delayed construction
	Los Peñasquitos Recycled Water Pipeline	Construction March 2012 – January 2013
	Pacific Highlands (along Phase II alignment)	Construction December 2011 – May 2015
Pipeline Extensions	Westview Parkway Extension	End of construction December 2011
	Black Mountain Road Pipeline Extension	End of construction December 2012
	Park Village Extension	End of construction June 2012

Source: City of San Diego Public Utilities Department Recycled Water Program Staff

There are an additional 19 planned customer connection projects that will increase recycled water use by 2015, including City property retrofit projects, customers identified in the *2005 Recycled Water Master Plan Update* (Phase II and Tier 1), conditioned sites and private retrofits along planned pipeline extensions, new development projects, and pending customer connections currently in plan review. A list of these planned recycled water customers and anticipated recycled water demands is shown in Table 2-4.

Note that there are two offset projects for new developments (University Towne Center project and the Alvarado Apartments) where the anticipated demand from the projects is offset by converting public properties to recycled water. The public properties that will be receiving recycled water are listed below the development project names.

Once completed, the planned customer connection projects are expected to increase the average recycled water demand by approximately 2,167 AFY (1.9 mgd) by 2015. It should be noted that actual demands will be determined during implementation and the City will continue to monitor and update demands as projects come online. Historically, the number of customer connections has been lower than planning estimates. Therefore, the estimate of 2,167 AFY includes an adjustment factor based on the highest observed historical connection rate (refer to Section 5.2.1 for more information).

Table 2-4. Planned NSA Recycled Water Customers by 2015

Project Type	Project No.	Project Name	Projected Usage (AFY) ¹

Sources: Provided by City of San Diego Public Utilities Department Recycled Water Program Staff at February 11, 2011 and March 3, 2011.

Notes: MAD – Maintenance Assessment District

¹ Actual quantity of recycled water to be determined on each project's completion. The City will continue to monitor and update non-potable demands as projects are implemented. Adjustment factor is based on the highest observed historical connection rate (refer to Section 5.2.1).

² Phase II demands based on 2005 Recycled Water Master Plan Update, suite of recycled water pipeline projects that extend from west from Black Mountain Rd to Carmel Valley along the Highway 56 corridor. Identified customers include Tier 1 through Tier 4 customers in Sub-areas 6 and 7.

³ Tier 1 customers identified in 2005 Recycled Water Master Plan Update with non-potable demand > 20 AFY.

⁴ Site demand accounted for in the Phase II project's total of 1000 AFY.

⁵ Recycled Water commitments, as of February 2011, as a result of Water Supply Assessments and Developer Agreements.

⁶ Potable offset projects as a condition of development.

⁷ Estimated total demand based on usage of currently installed meters (50% of overall total).

⁸ Includes both irrigation and cooling tower estimated usage.

⁹ Customers have completed plan review or are currently in plan review.

¹⁰ San Diego Gas and Electric (SDG&E) construction project is only for two years; total planned usage is 670 AF.

Any projects that are conversions of existing potable users to recycled water were removed from the Potable Water Customer database for the analysis to identify potential new recycled water retrofit customers (refer to Section 4.3.1 for more information on the Potable Water Customer database).

2.2 Southern Service Area

The SSA is supplied recycled water by the SBWRP, a tertiary treatment plant. It consists of 3.12 miles of City-maintained pipeline that conveys recycled water to the City's retail customers and Otay Water District, a wholesale customer. Title 22 recycled water is produced to meet daily demand and remaining wastewater is treated to secondary and discharged through the South Bay Ocean Outfall (SBOO). Discussion of the SBWRP will be covered in a Section 3.

2.2.1 Existing Southern Service Area Recycled Water Customers

Similar to the NSA, an average of CY 2009 and CY 2010 demands are described for the SSA existing demands. The majority of recycled water from the SBWRP is currently being used by Otay Water District, which had a demand of 3,209 AFY (2.9 mgd) for CY 2009/2010. In addition to the SBWRP in-plant demands, there are currently four retail recycled water meters owned by 3 customers within the SSA, with a total demand of 626 AFY (0.6 mgd) for CY 2009/2010. Two of the customers are Caltrans and IBWC Wastewater Treatment Plant. The third customer is RMA Land Construction, a construction meter installed November 2010 for a State of California project.

2.2.2 Southern Service Area Expansions (Planned by 2015/2026)

Although City staff continue to work with potential Southern Service Area customers, there are no confirmed additional customers to be connected to recycled water (other than temporary connections) within the SSA by 2015. The IBWC will be phasing out purchasing recycled water from SBWRP by September 2011, and CalTrans is expected to increase demand by 2015, resulting in a net decrease of 526 AFY (0.5 mgd) by 2015.

There is one planned temporary retail meter for San Diego Gas and Electric (SDG&E) construction of a filling station. This meter is projected to use a total of 670 AF over a two year period starting in late 2011.

Wholesale Customer – Otay Water District

Otay Water District is the single wholesale customer for the SBWRP and has an agreement with a City through 2026. The agreement calls for an annual average flow rate in AFY that increases year by year to 5,847 AFY in 2026. The agreement also includes maximum recycled water flow rate of 6.0 mgd. Because the City's contract with Otay Water District extends through 2026, this contractual flow rate is assumed in the baseline flows. Refer to Section 4.3.4, Participating Agency Surveys for the basis of the numbers.

In addition, Otay Water District has provided flow projections through 2040, which is a total of 10,110 AFY (9.0 mgd) or 4,263 AFY (3.8 mgd) in addition to the 2026 demand of 5,847 AFY. Assuming 900 AFY will be supplied by Otay Water District's Ralph W. Chapman Water Recycling Facility, Otay Water District would want an additional 3,363 AFY (3.0 mgd) from the SBWRP. Concepts for routing additional wastewater to SBWRP to meet these demands are discussed in Section 3.

2.3 Summary of Baseline Recycled Water System

A summary of each service area's baseline recycled water customers (or number of meters) and pipelines is shown on Table 2-5 and a summary of each service area's baseline demands is shown of Table 2-6. Note that information for customers, pipelines, and demands are constantly changing as the City progresses with its recycled water program. Values are based on latest information available at the time of this study.

Section 3 provides information on recycled water supplies (existing and potential) to serve the baseline system and potential non-potable reuse concepts identified later in this report.

Table 2-5. Summary of Baseline Recycled Water Customers and Pipelines

Source: City of San Diego Public Utilities Department Recycled Water Program Staff

All numbers represent average annual demands.

Notes: ¹ Existing demands based on Recycled Water Demand Projections spreadsheet (March 8, 2011) provided by City of San Diego Public Utilities Department Recycled Water Program Staff. Estimates represent average use between CY09 and CY10.

² Planned 2015 non-potable reuse totals provided by City of San Diego Public Utilities Department Recycled Water Program Staff based on Planned Recycled Water Projects table (February 11, 2011) and revision email dated March 3, 2011.

³ Does not include SDG&E filling station construction project which is projected to use 335 AFY for a two year period starting in January 2011.

⁴ Otay Water District contract demand is 5,847 AFY in 2026 based on City SD/Otay Water District agreement through 2026, which is assumed for the planned flow.

This page intentionally left blank.

SECTION 3

RECYCLED WATER SUPPLY

The following section discusses the City's recycled water supply from existing facilities, potential expansions to the recycled water supply, and tributary protection measures undertaken by the City. This section is based on information from TM 4 prepared as part of the Recycled Water Study.

Source water for the recycled water system is supplied through the City's wastewater collection system. The City owns and operates the Metropolitan Wastewater System (Metro System) that serves a 450-square-mile area that includes incorporated areas of the City and the Participating Agencies (PAs):

- City of Chula Vista
- City of Coronado
- City of Del Mar
- City of El Cajon
- City of Imperial Beach
- City of La Mesa
- Lemon Grove Sanitation District
- City of National City
- Otay Water District
- Padre Dam Municipal District
- Poway
- San Diego County Sanitation District

The majority of the collection system relies on gravity to transport wastewater to treatment facilities, but pump stations are required to lift the wastewater at certain locations throughout the collection system. There are currently 83 pump stations throughout the City's collection system. The two largest pump stations are Pump Station No. 1 (PS1) and Pump Station No. 2 (PS2). PS1 collects wastewater from the southern portion of the Metro System service area and pumps it northward to PS2 via the South Metro Interceptor (SMI). PS2 pumps wastewater collected from the Metro System to the PLWTP via two 87-inch force mains. The PLWTP is the City's largest treatment facility, treating the majority of the wastewater generated within the service area. Two other treatment facilities, the NCWRP and the SBWRP, provide an additional 30 mgd and 15 mgd of treatment, respectively. Figure 3-1 (located at the end of this section for continuity) presents a schematic of the Metro System's interceptors and trunk sewers.

The NCWRP and SBWRP are the two water reclamation plants that produce recycled water that can be supplied to beneficial reuse. This section describes the NCWRP and the SBWRP current process and flows, projected flows, and water quality. This section also evaluates contributing wastewater sources and potential additional supply from recycled supply facility improvements, including (1) increased flow diversions to the existing SBWRP, and (2) potential supply from new satellite plants.

3.1 Existing Supply Facilities

Existing recycled water supply facilities include the NCWRP and the SBWRP. Section 3.1 describes existing facilities, current process and projected flows with no additional infrastructure improvements, and historical water quality. Note that data is presented based on CY 2009, which was the most recent data available at the time of analysis of wastewater flow projections. Although CY 2010 data is now available, it is not expected to change the findings of the analysis.

3.1.1 North City Water Reclamation Plant

The NCWRP, commissioned in 1997, is a reclamation facility that treats wastewater generated in the northern San Diego region, including the City of Del Mar, City of Poway, and northern San Diego communities such as Mira Mesa, Rancho Penasquitos, and Scripps Ranch. After undergoing tertiary treatment and disinfection, the recycled water is distributed to surrounding communities for irrigation and industrial uses. Refer to Figure 3-2 for the NCWRP treatment process schematic. A portion of the flow is demineralized at the NCWRP to maintain recycled water total dissolved solids (TDS) concentration at or below 1,000 mg/L. Raw and waste activated sludge from the NCWRP are pumped approximately 5 miles to the Metropolitan Biosolids Center (MBC) for treatment. Excess secondary or tertiary effluent from the NCWRP is discharged back to the Metro System in the New Rose Canyon Trunk Sewer (RCTS) where it combines with the raw wastewater and flows to the PLWTP and is discharged to the ocean through a 4.5-mile outfall.

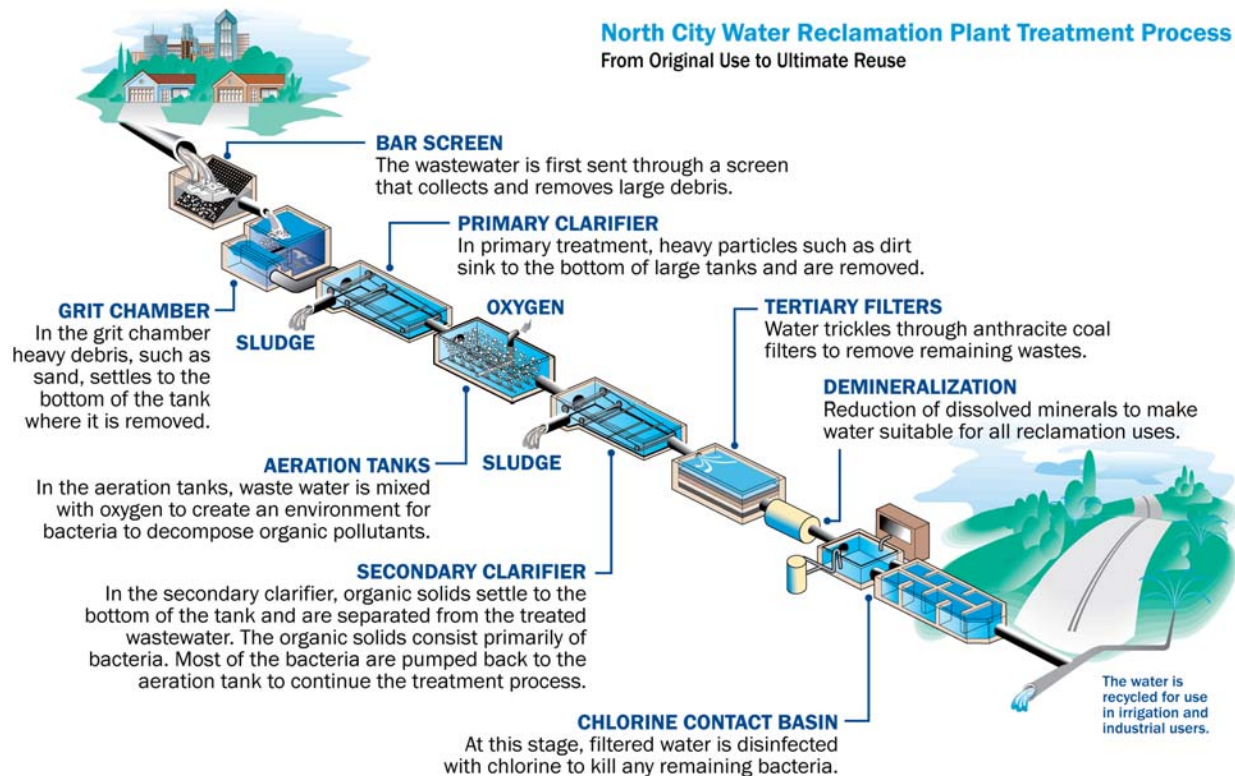

Figure 3-2. NCWRP Process Schematic

3.1.1.1 NCWRP Current Supply

The current NCWRP capacity is 30 mgd average annual daily flow (AADF) and was designed for expansion to 45 mgd AADF. The NCWRP receives influent directly from the Penasquitos Pump Station (PQPS) and a portion of the flow in the New RCTS which conveys the Pump Station No. 64 (PS64) force main discharge (refer to Figure 3-1 located at the end of this section). Currently, 7 mgd is received from the PQPS and approximately 16 mgd is diverted from the New RCTS. Table 3-1 provides a summary of the NCWRP's design capacity and recent flow activity in 2009.

Table 3-1. NCWRP Capacity and Recent Flow Summary			
Design Capacity ¹	Actual Intake ²	Recycled Water Distributed ²	Flow Returned to PLWTP ^{2,3}
30.0	20.3	4.6	15.7

Note: All flows are in mgd

¹ Average Annual Daily Flow (AADF)

² Daily average from CY 2009

³ Not all flows treated to tertiary.

Source: City of San Diego

The influent flow at the NCWRP has remained fairly constant at approximately 23 mgd from 2003 to 2009, although there are very brief periods of minimum or maximum flows. Figure 3-3 presents the daily average influent flow trend from 2003 to 2009, and Table 3-2 summarizes the range of data during this period.

3.1.1.2 NCWRP Projected Supply

Unit generation rates (UGRs) used to project new values were established using the updated wastewater information and last year's flow and strength monitoring data and modeling results. The City applied separate UGRs to residential population and commercial/industrial population. The projected values do not account for solids returned to the system from upstream water reclamation facilities (NCWRP, SBWRP) and MBC. The City analyzes these internal system return flows separately through Metro System mass balance evaluations. In addition, non-population based sources of wastewater such as major industrial discharges, trucked liquid waste, and inflow and infiltration (I/I) were determined independently of population growth. These non-population based sources were then added to the products of the UGRs and the population values. Reductions in I/I due to the City's maintenance work on the collection system are accounted for in the flow projections by evaluating recent metered data and calibrating it against numerous flow monitoring data.

The City provided projected Annual Average Daily Dry Weather Flow (AADDWF) for major trunk sewers throughout the Metro System for the years 2010, 2015, 2020, 2025, 2030, and 2035. These projections were calculated using SANDAG Series 12 population data and are based on the assumption that the UGRs remain constant during this study's planning period. This creates an upper limit for dry weather flows. Projections assuming the UGRs will continue to decline in the future were then calculated. This created a lower limit for projected dry weather flows. Because of the uncertainty in predicting future UGRs, the midpoint between the upper and lower dry weather flow projections will be used when planning for new facilities. Figure 3-4 gives a graphical representation of this methodology.

Projected 2035 NCWRP production from existing facilities is summarized in Table 3-3. Projections shown are for the existing PQPS and PS64 tributary areas only.

The projected flows are sufficient to meet baseline demands, although the potential maximum day demands (MDD) for some non-potable distribution system concepts presented later in Section 5 are greater than projected flows. Potential non-potable reuse demands along existing distribution facilities are expected to be comparable to projected supply flows, and could be pursued up to capacity of existing supply facilities.

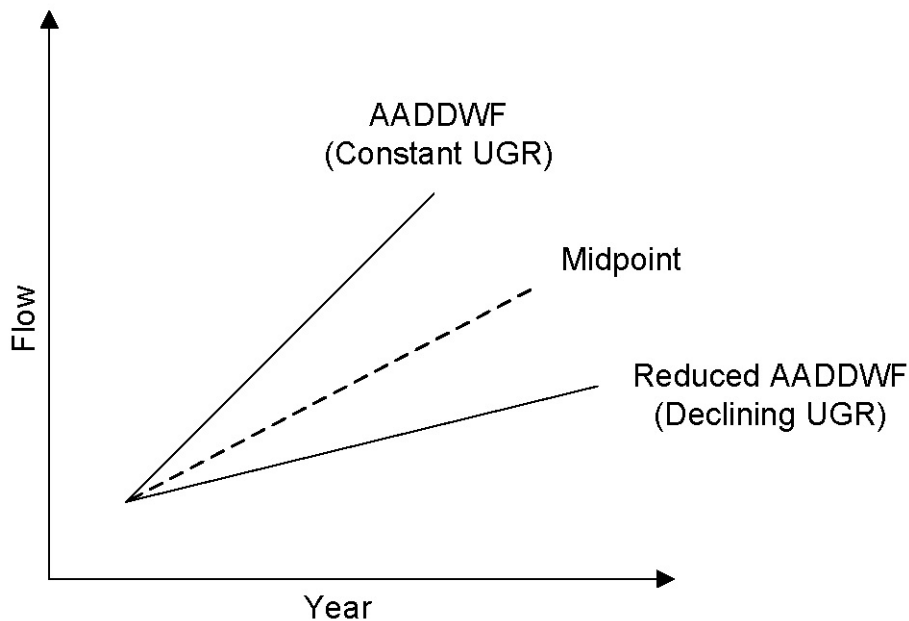

Figure 3-4. Midpoint Between AADDWF and Reduced AADDWF
AADDWF: Annual Average Daily Dry Weather Flow

Table 3-3. Projected 2035 NCWRP Recycled Water Production					
Average Annual Daily Dry Weather Flow (mgd)					
Wastewater Influent			Projected Tertiary Effluent		
Reduced	Midpoint	Original	Reduced	Midpoint	Original
27.3	28.8	30.3	23.3	24.8	26.3

Note: Projected tertiary effluent flow was calculated using a Metro System mass balance model which accounts for variations in water quality and treatment processes.

3.1.1.3 NCWRP Water Quality

The NCWRP average daily effluent concentrations for TDS from 2004 to 2009 are presented below on Figure 3-5. The average TDS for effluent is 939 mg/L, which is just below the maximum allowable concentration for recycled water (1,000 mg/L).

High TDS concentrations may be attributed to wastewater contributions from low-lying communities that are more susceptible to infiltration of brackish, high TDS groundwater, or changes in the potable water source and quality, since a large portion of indoor water used becomes wastewater influent. To reduce TDS, the plant's tertiary effluent water is demineralized through an electrodialysis reversal (EDR) process and then blended back with the remaining tertiary effluent. NCWRP's EDR capacity is currently being increased from 5 mgd to 6 mgd. This increase will help lower the effluent TDS concentration by allowing a larger quantity portion of the lower TDS water to be blended with the tertiary effluent.

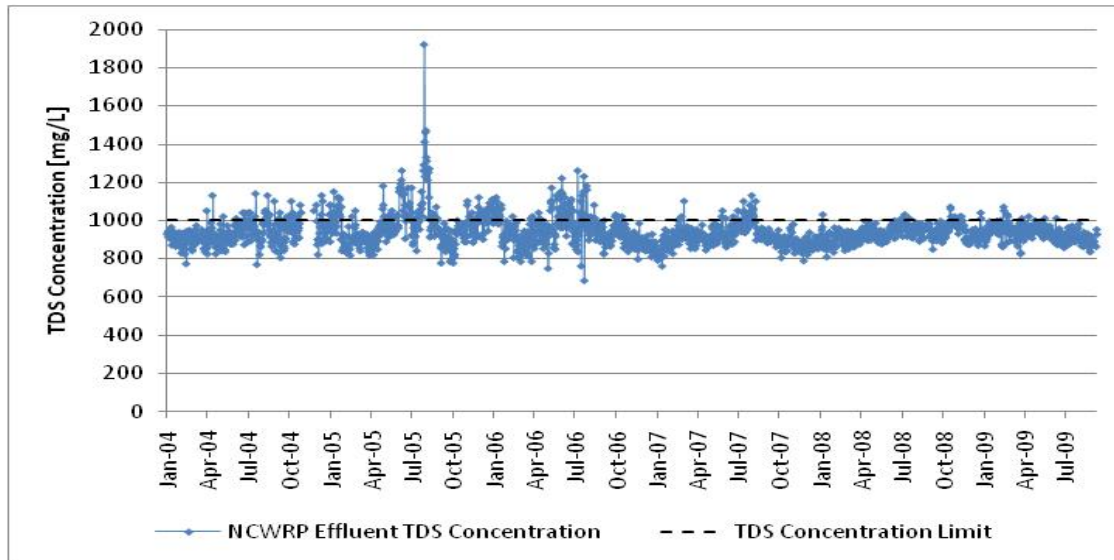

Figure 3-5. NCWRP Effluent TDS Concentration 2004-2009

3.1.2 South Bay Water Reclamation Plant

The SBWRP was commissioned in 2002 and has the capacity to treat up to 15 mgd AADF. The plant is located in the Tijuana River Valley near the international border and services the southern region of the Metro System service area. Tertiary treated water is distributed to surrounding areas for reclamation purposes while the remainder of the flow is discharged to the ocean via the 3.5-mile long SBOO. Raw and waste activated sludge removed at the SBWRP are returned to the collection system for transport to the PLWTP for treatment. Refer to Figure 3-6 for the SBWRP treatment system schematic.

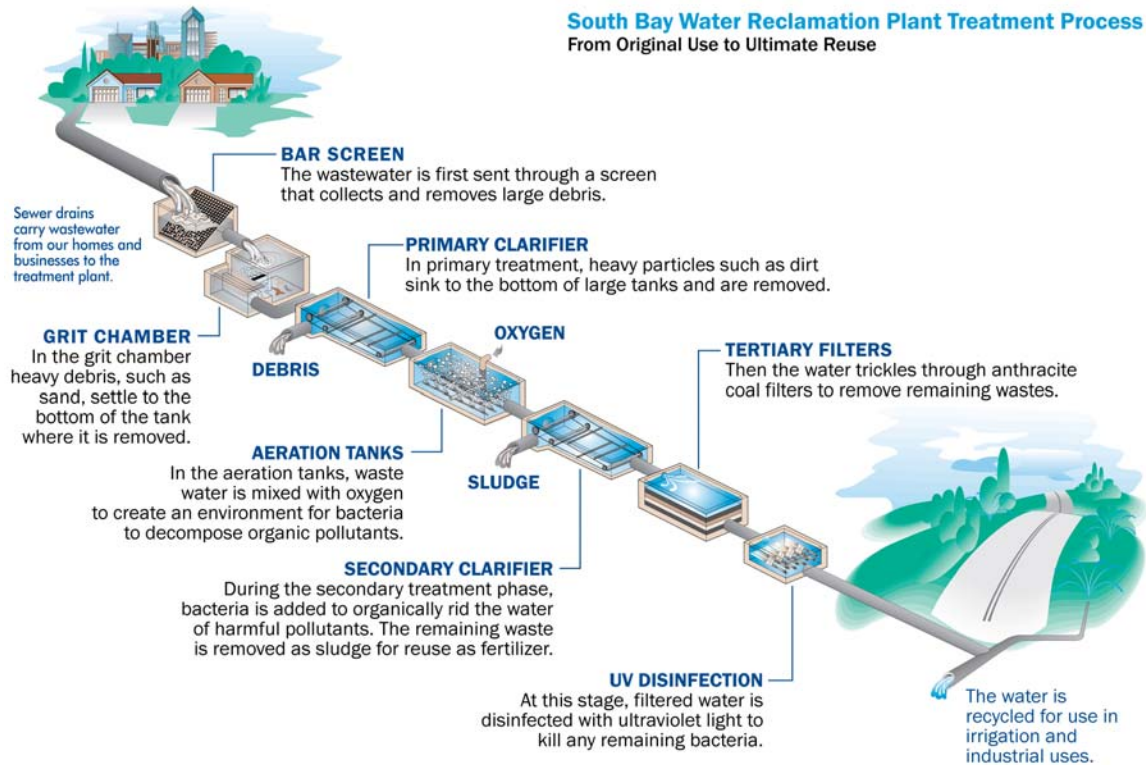

Figure 3-6. SBWRP Process Schematic

3.1.2.1 SBWRP Current Supply

The SBWRP began treating approximately 4.6 mgd of wastewater in 2002 from the South Bay area, conveyed to the plant via the Grove Avenue Pump Station (GAPS); refer to Figure 3-1 located at the end of this section. In the summer of 2006, the plant began increasing the amount of wastewater treated by approximately 4 mgd to a total of 8.6 mgd. The increase was done in order to meet the increased recycled water demand from the Otay Water District, which had just completed an extension of their recycled water distribution system. This increase in the summer of 2006 is presented on Figure 3-7. Table 3-4 provides a summary of the SBWRP's design capacity and recent flow activity.

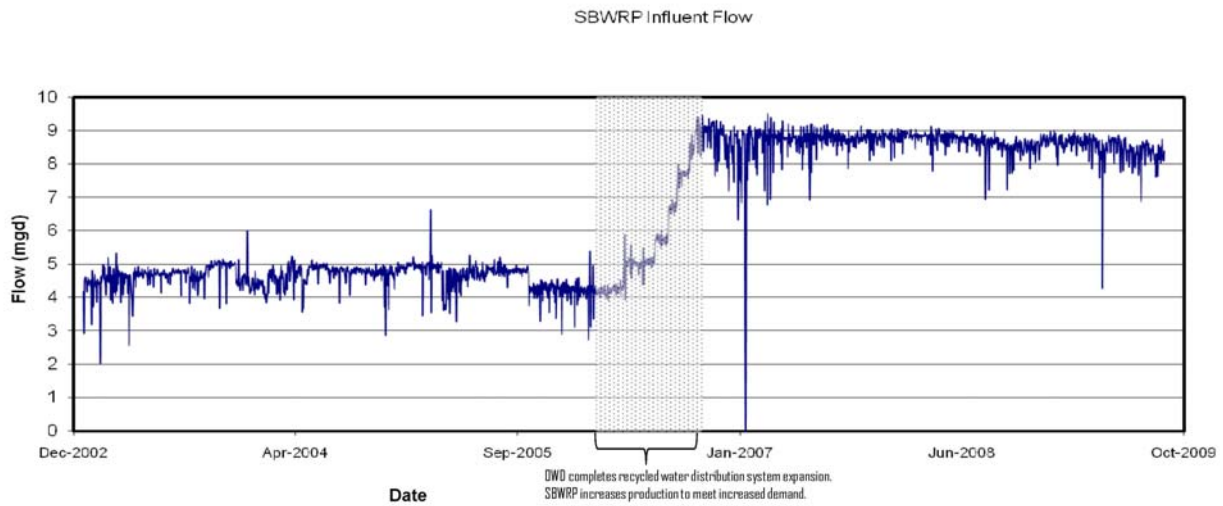

Figure 3-7. SBWRP Average Daily Influent Flow 2003-2009

Note: All flows are in mgd. Solids are sent to the PLWTP.

a. Average Annual Daily Flow (AADF)

b. Daily average from 1/1/2009 through 6/30/2009

Source: City of San Diego

An evaluation of influent flow data from 2003 to 2009 provides the range of flows the plant experienced during that period. Table 3-5 indicates the range is from 2.0 mgd to 9.5 mgd with an average of 6.4 mgd. A plant shutdown for construction may have occurred in January 2007, but since this is not a common occurrence, it was not presented as the minimum flow in Table 3-8. The average flow to the SBWRP from January 2003 to April 2006 was 4.6 mgd. After the increase in the summer of 2006, the average flow was 8.6 mgd from October 2006 to August 2009.

3.1.2.2 SBWRP Projected Supply

Projected 2035 SBWRP production from existing facilities is summarized in Table 3-3. Projections shown are for the existing GAPS tributary areas. Refer to Section 3.1.1.2 for the methodology used to develop these projections.

Table 3-6. Projected 2035 SBWRP Recycled Water Production					
Average Annual Daily Dry Weather Flow (mgd)					
Wastewater Influent			Projected Tertiary Effluent		
Reduced	Midpoint	Original	Reduced	Midpoint	Original
12.2	12.9	13.6	10.5	11.0	11.5

Note: Projected tertiary effluent flow was calculated using a Metro System mass balance model which accounts for variations in water quality and treatment processes.

The projected flows are sufficient to meet baseline demands in the long-term. Additional wastewater flow diversions would be required to meet potential identified demands for Otay Water District in the future. Section 3.2 discusses the possibility of expanding wastewater flow diversions to SBWRP.

3.1.2.3 SBWRP Water Quality

Figure 3-8 shows the average daily effluent TDS concentrations from the SBWRP from 2007 to 2009. The average TDS concentration is 940 mg/L, just below the 1,000 mg/L maximum recycled water allowance.

Due to variable TDS levels in imported water and the added TDS caused by the treatment process, the SBWRP may not be able to meet the 1,000 mg/L limit in the future without having a demineralization facility.

Figure 3-8. SBWRP Effluent TDS Concentration 2007-2009

3.2 Potential New or Expanded Supply

Although the existing treatment plants have sufficient supply to meet baseline demands in the long-term, the following expanded supply alternatives were evaluated in conjunction with expanded distribution system concepts:

- New Satellite Plants – three new satellite plants were evaluated to supply expanded non-potable demands
- Expanded Supply from SBWRP – Expanded wastewater flow diversions for potential additional Otay Water District non-potable demands beyond the baseline.

3.2.1 New Satellite Plants

New satellite plants could be considered to serve new non-potable demands in areas not currently served by the NCWRP and the SBWRP. A satellite plant could be a packaged wastewater treatment system capable of producing recycled water for non-potable reuse. Satellite plants are considered decentralized systems where wastewater is diverted from a nearby sanitary sewer line and treated for use in nearby localized areas. Advantages to decentralized systems include less major infrastructure needed and more opportunities for local reuse. However, satellite plants will require additional operation and maintenance, have a higher unit cost per water produced, and requires a means for solids disposal or treatment.

The following three locations were selected as potential new satellite plants based on nearby available demands identified in Section 4:

- Rancho Bernardo
- Balboa Park
- Qualcomm Stadium /Mission Valley

Sizing of the satellite plants is based on projected demands of the plants calculated in Section 5, and preliminary plant capacity requirements are summarized in Table 3-7. It is expected that wastewater flows in the area will provide sufficient source water to meet anticipated demands.

Table 3-7 Proposed Satellite Treatment Plant Projected Capacities	
Satellite Plant	Projected Capacity Required ¹ (mgd)
Rancho Bernardo	5
Balboa Park	2
Qualcomm Stadium/Mission Valley	3

¹ Assumes a peak day demand factor of 2.0.

For this study, conventional treatment is proposed at the Rancho Bernardo satellite plant. Due to site constraints, membrane bioreactor (MBR) plants are proposed for the satellite plants at Balboa Park and Qualcomm Stadium as they meet Title 22 standards with a smaller footprint than conventional treatment.

MBRs integrate biological degradation of waste with membrane filtration by combining the activated sludge process with a micro- or ultra-filtration membrane system. The membrane system replaces the traditional gravity sedimentation unit (clarifier) in the activated sludge process. Turbidity and suspended solids concentration of the effluent is far lower than in conventional treatment. MBRs require less space and are

more automated than conventional treatment facilities. Membrane bioreactors are more expensive than conventional treatment, however.

Some potential customers that could be served by satellite plants may require advanced treatment with reverse osmosis (RO) to address TDS concerns. In these specific cases, an on-site RO plant at the point of use should be considered.

3.2.2 SBWRP Potential Expanded Flows

It may be possible to divert flow upstream of the PLWTP and pump it to the SBWRP for treatment and eventual reuse. Additional flow may be used for recycling purposes or to discharge through the SBOO to offload flow from PLWTP. A schematic of the south area trunk sewers and potential diversion locations are provided on Figure 3-9.

Projected 2035 dry weather flows tributary to the SBWRP are approximately 13 mgd with no additional infrastructure. If flow is diverted just downstream of the Spring Valley (SV 8) Trunk Sewer connection to the South Metro Interceptor (SMI), approximately 44.8 mgd can be conveyed to the SBWRP in 2035, as shown in Table 3-8.

The SV 8 diversion, previously proposed to occur before 2025, would prevent exceeding the TSS mass emission rate limit imposed on the PLWTP effluent. The SV 8 diversion is recommended in the Metropolitan Wastewater Department's Master Plan, and would provide significantly more flow to the SBWRP than potential non-potable demands served by the SBWRP.

Expansion of secondary treatment capacity at the SBWRP would be necessary to accommodate the additional wastewater flow diversions. However, existing tertiary treatment capacity is likely comparable to potential future non-potable demands (see Section 5.4).

Table 3-8. Projected 2035 SBWRP Recycled Water Production with Additional Wastewater Flow Diversions						
Diversion Strategy	Average Annual Daily Dry Weather Flow (mgd)					
	Wastewater Influent			Projected Tertiary Effluent		
	Reduced	Midpoint	Original	Reduced	Midpoint	Original
GAPS + Spring Valley Metro Connection No. 8	42.4	44.0	47.1	35.0	37.6	40.1

Note: Wastewater influent totals include the Grove Avenue Pump Station (GAPS) and South Metro Interceptor flows from the Spring Valley No. 8 connection southward.

Interim Diversion

In the near-term, existing wastewater diversions are not adequate in meeting peak summer demands. As a result, an interim diversion should be reviewed to temporarily meet peak demands before a more permanent diversion system is installed. Further analysis not covered in this study should be performed to determine an adequate interim diversion system, which may be constructed by other agencies.

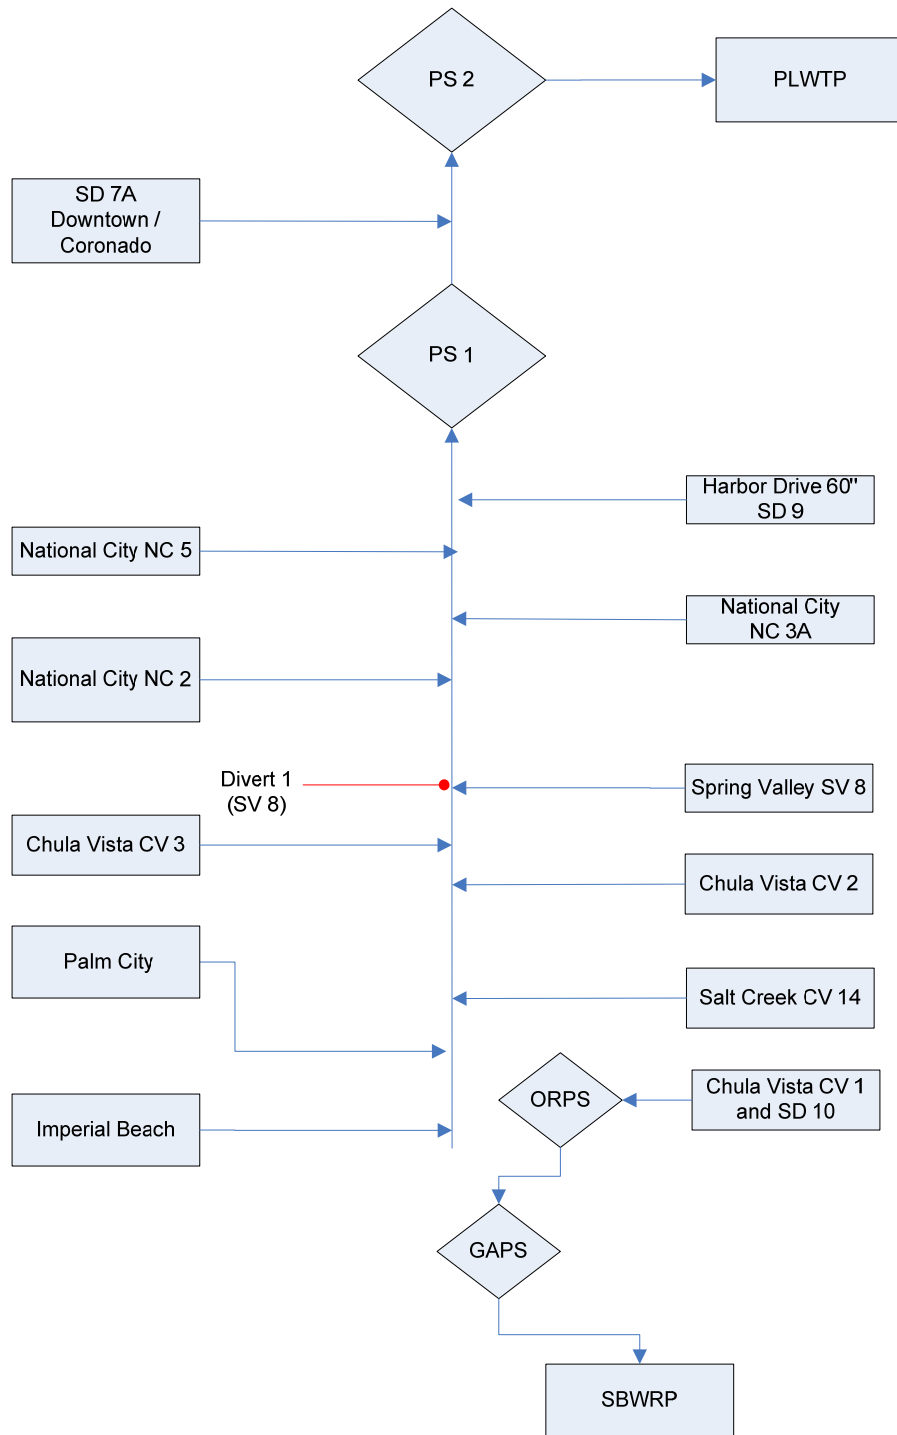

Figure 3-9. Schematic of the Metropolitan Sewerage System's South Area Trunk Sewers

3.3 Tributary Protection Measures

The City recognizes that to maintain adequate wastewater quality for water reclamation treatment processes, and to protect public and private property, restrictions may be required on certain industrial, commercial and residential waste discharges to the sewerage systems that are located within a designated tributary area of an existing or planned reclamation facility.

To apply and enforce discharge limits that protect the collection system, the treatment plant, and the ocean, the Metropolitan Wastewater Department operates the Industrial Wastewater Control Program (IWCP). The program is a joint effort between the City, other agencies served by the Metropolitan Sewerage System, and local industry to control contaminants before they enter the sewer system. The IWCP issues discharge permits, performs inspections, conducts wastewater monitoring, and enforces sewer discharge standards at businesses and industries throughout the entire Metro service area.

Waste discharges to the sewage system from any industrial, commercial or residential source may be restricted or prohibited upon a finding, following a noticed public hearing, that the type or class of discharge involved is capable of causing or may cause substantial damage or harm to any sewage treatment or reclamation facility or to any significant user or users or potential user or users of reclaimed water within an area which has been planned for reclaimed water service (Municipal Code section 64.0514).

SECTION 4

INITIAL MARKET ASSESSMENT

The market assessment summarizes the potential non-residential, non-potable reuse demands that exist within the City and surrounding water agencies. This evaluation focuses on existing system retrofits to use recycled water in lieu of potable water and does not address new recycled water uses that might be created through new developments. This market assessment is intended for long-range planning purposes through the 2035 planning year.

The primary uses of recycled water that are considered are irrigation and cooling towers. Irrigation has historically been the most common application for recycled water use in the San Diego area, and there is a high potential for additional recycled water irrigation use. Because cooling tower water is the largest potential use of recycled water for the majority of industries in the San Diego region, this application was another focus of this Study. Use of recycled water for other industrial processes was not considered as the suitability of the water must be evaluated on a case-by-case basis, and typically is not as cost-effective due to treatment needs. Car washes and commercial laundries were evaluated to determine if they would be suitable for recycled water use, and a sampling of the City's highest commercial and industrial potable water customers were contacted to discuss other potential uses of recycled water.

This section describes the following:

- Market Assessment Approach
- Previous Market Analysis
- Sources of Information to Identify New Customers
- Initial Market Assessment
- Non-Potable Reuse Demand Focus Areas

4.1 Market Assessment Approach

The non-potable reuse market assessment is an iterative process, and is conducted in two main steps (refer to the market assessment work flow shown on Figure 4-1).

Step 1 – Initial Market Assessment to Identify All Potential Customers

This section presents the methodology and results of Step 1 of the market assessment, which is the maximum amount of recycled water that could be reused without consideration of how the demands would be accommodated with a distribution system. Potential demands identified include irrigation and cooling tower applications within the City's service area, as well as potential wholesale demands from nearby agencies. Once all potential demands are identified, subareas are delineated around areas with high concentrations of demand to determine focus areas for non-potable reuse expansion concepts.

Step 2 – Refine Initial Assessment Based on Supply/Distribution System Alternatives and Probability of Connection Factors

While Step 1 identifies all potential non-potable demands for the City, it is not cost effective to serve all of the non-potable recycled water demands due to the distribution system infrastructure that would be required. Therefore, the purpose of Step 2 of the non-potable reuse market assessment is to refine the analysis to reflect:

- (1) which demands could be served with the proposed distribution system concepts (in Section 5), and
- (2) the estimated probability of connection to the system.

A key issue when dealing with the retrofit market is that customer connections to the recycled water system are voluntary and the customer is responsible for paying for service and any necessary on-site improvements. In order to estimate realistic non-potable reuse demands, historic connection and usage data from the City's existing recycled water system was evaluated to develop a probability of connection factor (see Section 5.2.1) that is applied to new distribution system alternatives.

Note that the refined market assessment is presented in Section 5, after distribution system concepts have been identified.

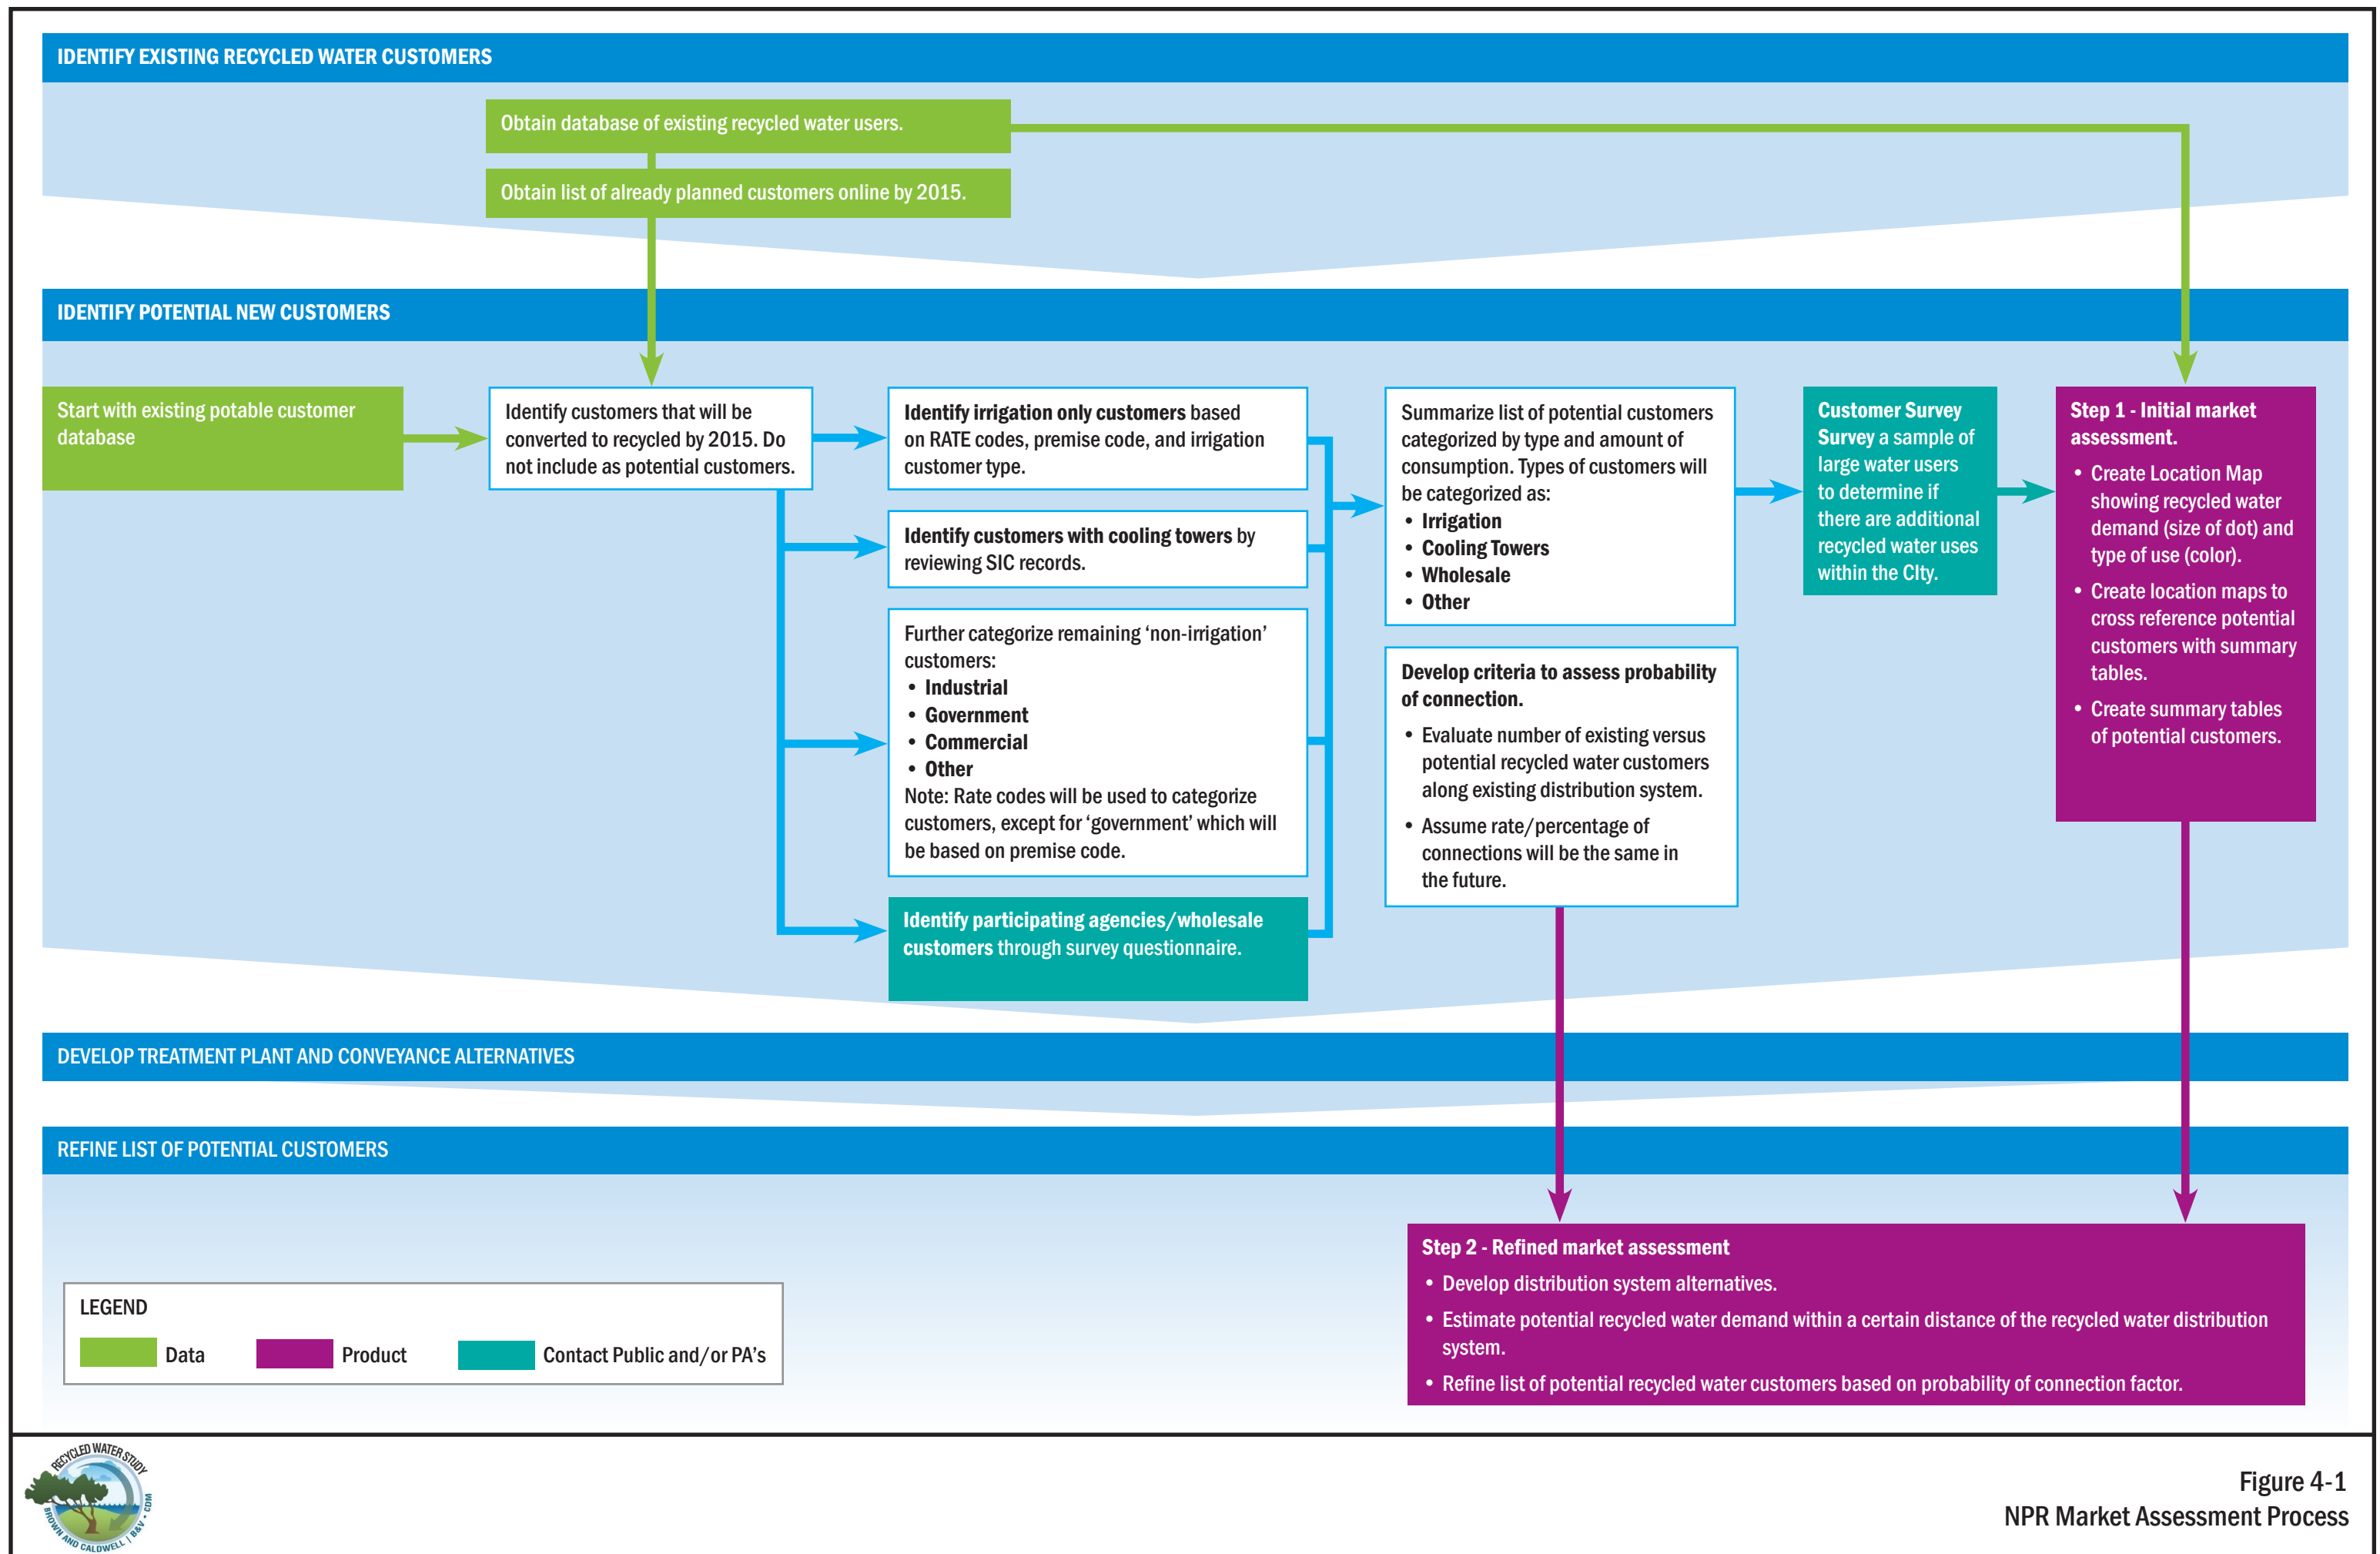

Figure 4-1
NPR Market Assessment Process

This page intentionally left blank.

4.2 Previous Market Analysis

The City has conducted several market assessments and master plans for the recycled water system, which are summarized in Table 4-1. Refer to Appendix A for additional information. The most recent market assessment update was completed as part of the 2005 Recycled Water Master Plan, which focused on non-potable reuse within specific areas of the City's overall service area. The City also completed a Water Reuse Study in 2006 which evaluated other strategies for recycled water beyond non-potable reuse.

4.3 Sources of Information to Identify New Customers

The initial market assessment was developed as part of TM 1 of the Recycled Water Study. Several different sources of information were used to identify potential customers for recycled water, including:

- the City's potable water customer database to identify irrigation customers,
- the City's industrial waste dischargers database to identify potential cooling tower customers,
- phone surveys conducted with commercial and industrial customers who use large quantities of potable water, and
- surveys conducted with nearby agencies to determine potential regional wholesale demands.

4.3.1 Potable Water Customer Database

The Potable Water Customer (PWC) Database is a geodatabase provided by the City to assist in identifying potential recycled water customers. The information was extracted from the Water Department's Customer Information System (CIS) database and contains 22,033 records, with each record representing a non-residential, non-recycled water meter and the associated fiscal year (FY) water use between July 1, 2008 and June 30, 2009 (FY 2009). All records are spatially referenced, which allows the data to be used with various geographic information system (GIS) programs to geographically locate the meters. The data fields in the database provide the following information:

- Meter account number
- Meter identification number
- Street address
- Premise code
- Rate schedule code
- Customer type
- Water usage from the beginning of July 2008 to the end of June 2009 (FY 2009)
- Other data related to demand and billing customer information

Three fields were identified to provide information on the customer classification and water used: premise code, rate schedule code, and customer type. The premise code describes the type of dwelling or government agency the water service is providing for, while the rate code identifies the rate schedule used for computing the customer's bill. A listing of premise codes and rate codes with definitions was provided by the City and is shown in Appendix B. The customer code classifies each customer in the following categories: commercial, industrial, institutional, irrigation, zoo, and California American Water.

Note that the most recent data at the time of analysis was through FY 2009. Figure 4-2 shows historical potable water sales from FY 1998 through FY 2010. In June 2009, the City responded to drought conditions with enforcement of Level 2 mandatory water restrictions, including limits on landscape irrigation, vehicle washing, and water feature operations. These water use restrictions explain the further reduction in water use in FY 2010. As a result, FY 2009 data is closer to average water use (94 percent of average in FY 2009 versus 84 percent of average in FY 2010), and it is assumed that the estimates within this study are conservative.

Figure 4-2: City of San Diego Historical Potable Water Sales

Source: City of San Diego Annual Water Audit Reports (FY 2009)

4.3.2 Wastewater Database for Cooling Tower Identification

The Industrial Wastewater Control Program (IWCP) database (FY 2009) obtained from the City was used to identify existing cooling towers that could potentially convert to recycled water. The IWCP database contains 9,885 records and lists facility name, address, identification number, connection type, flow rate and concentrations of certain water quality parameters. Addresses were extracted from the database and used to geographically identify the cooling tower facilities in GIS. Wastewater flows are categorized by process name such as sanitary, employee loss, or wash water. There are several different cooling tower process flows included in the database (i.e., blowdown, bleed, evaporation, etc.).

Wastewater treatment agencies base their customer rates on the amount of potable (or recycled) water used. Cooling tower evaporation rates or losses are monitored and listed separately in the IWCP database because the facility is not charged wastewater fees for these flows since they are not conveyed or treated in the wastewater system. The combined flow of cooling tower processes for each facility was used as the cooling tower demand for this market assessment.

4.3.3 Market Assessment Survey

There are several customers in the PWC Database that are using large annual volumes of water through meters that are not classified specifically as irrigation use (those did not have a rate code, premise code, or customer type that was specifically categorized as irrigation within the PWC Database). The purpose of the market survey was to identify any water uses that could be met with recycled water for these remaining large 'non-irrigation' water customers. After removing all the customers classified for irrigation use, the remaining customers were grouped according to the following categories:

- Commercial
- Industrial
- Government

Tables C-1, C-2 and C-3 included in Appendix C summarize the Top 50 customers in the above three categories. Note that some customers may have multiple meters in the Top 50, and are listed only once as a single customer name in the table for purposes of the survey. The customers are categorized by type of business, and the table also identifies whether the customer is also one of the Top 50 customers of an irrigation meter, has a cooling tower, or already has a recycled water connection.

Potential survey customers included hotels, universities, parks, Navy bases, nurseries, commercial and industrial businesses, and other miscellaneous customers. Customers with irrigation meters for golf courses and parks are considered to be more probable potential recycled water users, and were not included in the survey. However, two additional irrigation meter customers, Pinnick, Inc. and Hanson Aggregates, were contacted due to their high volume water purchases to evaluate potential recycled water applications such as concrete mixing and wash down.

Customers were contacted by phone and completed questionnaires regarding water use, interest in using recycled water if applicable, and concerns with using recycled water. The completeness of the questionnaires were limited by information available from the potential customers, and varied widely from customer to customer. Appendix D includes a summary of the survey results (Table D-1), a map showing the location of all the surveyed customers (Figure D-1), and the completed questionnaires. Through the survey, five potential recycled water customers were identified that do not currently have a potable irrigation meter but could use recycled water for irrigation purposes. These customers included San Diego Unified Port District, San Diego Marriott Hotel & Marina, Marine Park Corp (Sea World), and the Zoological Society of San Diego (the San Diego Zoo). These customers have been included in the market assessment herein.

There are likely other potential recycled water customers in the PWC Database that fall under the commercial, industrial, and government categories as defined in this survey (i.e. may use water for irrigation but do not have an irrigation meter). A more in-depth public outreach program would be needed for identification of these demands.

4.3.4 Participating Agency Surveys

The Metro Wastewater JPA is a coalition of twelve municipalities and special districts (the PAs) in San Diego County that share in the use of the regional wastewater system. Since the PAs contribute wastewater and funding to the Metro wastewater system, it was important to determine the interest within the PAs to purchase wholesale recycled water, determine potential demands, and to solicit ideas to save overall system costs.

A survey form was developed to collect information from the water agencies listed in Table 4-2. A total of 11 agencies were contacted and all agencies responded. Of the 11 water agencies, eight provide service within the jurisdiction of the Metro Participating Agencies and three provide service to areas outside the Metro Wastewater System. The questions included in the survey form were focused on the following issues:

- The current level of recycled water system planning within each jurisdiction,
- The current and future (2035) estimated recycled water use,
- Interest in purchasing recycled water,
- Identification of preferred locations for connection to the City system,
- Information on concerns about recycled water (quality, acceptance, reliability, etc.), and
- Indication of the agency's confidence that a recycled water system could be implemented within their jurisdiction.

Appendix E includes a sample survey form. Appendix F includes the responses to the survey from the water agencies.

Initial analysis of the survey responses indicates that the agencies fall within three main sub-groups. These are:

- Existing wholesale customers,
- Agencies with an interest in purchasing recycled water from the City, and
- Agencies with no interest in purchasing recycled water from the City.

The agencies within the categories above are summarized in Table 4-3. Identified demands for existing and potential wholesale customers are discussed later in this section. It should be noted that the potential demands for Otay Water District have been updated through discussions with Otay Water District staff since the original survey was conducted. Updated numbers are included in the main sections of this report, and supersede the values on the survey in Appendix F.

4.4 Initial Market Assessment

This section presents the initial market assessment (Step 1) methodology and results. As discussed, this Step 1 of the non-potable reuse market assessment identifies the maximum amount of non-potable reuse water use within the city for irrigation-only and cooling tower applications, as well as potential wholesale demands. In Section 5, the market assessment is refined after the distribution system concepts have been determined (Step 2 of the market assessment).

4.4.1 Identification of Recycled Water Customers

Three types of potential customers were identified: irrigation customers, cooling towers, and wholesale customers. Other customers were also investigated, such as car washes and commercial laundries; however, these customers were not included in the market assessment because of the low overall water use and high cost of retrofits.

4.4.1.1 Irrigation Only

Customers with water meters that supply water only for irrigation purposes (i.e. golf courses) were identified in the PWC Database. These customers are considered ideal candidates for recycled water because irrigation uses are generally large demands; make up a larger portion of existing potable water use; does not need water treated to potable levels; and does not discharge water back into the wastewater system. In addition, site conversions can be achieved with lower risk of cross connections with the potable water system and more control over human contact since separate piping for the irrigation use is already in place.

Meters that service irrigation water only were identified within the PWC Database by selecting accounts based on their rate code, premise code, or customer type. Irrigation customers include companies that use water for agriculture, landscaping, golf courses, and other outdoor non-potable uses.

Customers that had the following criteria were selected as potential recycled water customers for irrigation use:

- Domestic irrigation only meter (rate code 25)
- Commercial irrigation only meter (rate code 35)
- Industrial irrigation only meter (rate code 45)
- Premise code for irrigation only (premise code 80)
- Customer type classified as irrigation and with rate code of 33 or 34 (indicates a dual meter)

Once the initial list of irrigation only customers was identified, the customers were compared to the City's identified listing of potable water customers that plan to switch to recycled water by 2015. Customers that will be receiving recycled water by 2015 were removed to avoid double-counting potential irrigation customers.

Average potable water demand for each customer was assumed to be equal to the field "annual daily demand (gpm)" in the database. A potential demand offset field (Pot_demand [AFY]) was added to the database to represent the potable water demand that can be offset by the customer if they switched to recycled water. Units were converted from gpm (gallons per minute) to AFY. When estimating the potential demand of recycled water based on the irrigation-only meters, it was assumed that 90 percent of the historical potable water demand in the database could be replaced by recycled water. The remaining 10 percent is assumed to be potable water use that cannot be replaced with recycled water and/or potential water conservation that might be encountered with system upgrades. Potential irrigation for highway medians was assumed to be 100 percent replaceable with recycled water. Based on information from the City, the dual meters are assumed to use 60 percent of the water for irrigation, which was assumed to be replaceable by recycled water. A summary of the percent of water demand calculated for potential offset to potable water demand is listed below:

- Irrigation: 90%
- Irrigation on CalTrans meters: 100%
- Cooling towers: 100%
- Dual-meter: 60%

Additional irrigation users that were not selected from the above criteria were added to the customer list. This included five potential customers identified in the phone survey (Section 4.3.3), as well as golf courses. Some golf courses were not initially identified using the selection method described in previous sections due to various reasons including (1) meters were categorized as government meters (for military golf courses), (2) golf course used groundwater or local surface water as a primary water supply, or (3) golf course purchased untreated water from the San Diego County Water Authority's aqueduct. Irrigation demands from these golf course customers had to be manually added. The golf courses are the Admiral Baker Golf Course, Bernardo Heights Country Club, Tecolote Canyon Golf Course, Naval Station Golf Course, Riverwalk Golf Course, Rancho Bernardo Golf Course, Rancho Bernardo Inn Golf Course, Presidio Hills Golf Course, Sail Ho Golf Course, and Oaks North Golf Course.

A total of 6,684 potential irrigation customers were identified beyond baseline customers (planned through 2015). The total potential recycled demand for the identified customers is approximately 25,284 AFY. A summary table of the number of customers categorized by annual demand is shown in Table 4-4, and the list of potential customers is shown in Appendix G.

Table 4-4. Summary of Irrigation-Only Meters Identified for Potential Conversion to Recycled Water

Annual Demand (AFY)	Number of Meters	Total Demand within Range (AFY)
< 5	5,293	8,565
5 - 10	957	6,634
10 - 20	331	4,410
20 - 100	91	3,460
>= 100	12	2,215
Total	6,684	25,284

4.4.1.2 Cooling Towers

4.4.1.2.1 Background Information

Cooling towers are large users of water and are potential candidates for conversion from potable to recycled water. They are used for various industrial cooling processes and for HVAC systems commonly found in large office, commercial, and school buildings. Depending on the application, a cooling tower can create year-round recycled water demand. Large water users may achieve significant cost savings by converting an existing potable water cooling tower to recycled water, along with recognition of community and environmental leadership. However, since each cooling tower system is unique, a case-by-case approach must be used to ensure system performance and protection of equipment.

Recirculating non-contact cooling towers are the most likely type of system to convert from potable to recycled water. Many of these retrofits have been successfully completed in the San Diego area and elsewhere. In recirculating non-contact systems, process water is sprayed over the top of packing elements within the cooling tower and travels downward while air is drawn upwards opposite the water flow. The warm water that evaporates into the atmosphere is considered the cooling tower evaporation loss. The cooled water which passes through the packing elements can be reused for a designated number of cycles. As pure water evaporates into the atmosphere the process water becomes concentrated with salts and other water constituents that must be bled off and replaced with makeup water. The majority of water lost in the process is due to the cooling tower blowdown or bleed which is discharged to the sanitary sewer system. A process diagram for a typical recirculating non-contact cooling tower is presented in Figure 4-3.

Figure 4-3: Recirculating Non-contact Cooling Tower Process Diagram

The number of cycles used in a cooling tower operation is dictated by the maximum level of concentrated salts and other water quality parameters allowed in the process water before being discharged as blowdown. The primary water quality parameters of concern for cooling towers are presented in Table 4-5. These water constituents can lead to operational problems such as scaling, biofouling and corrosion. Typically, the concentration for each of the water quality constituents listed in Table 4-5 is higher in recycled water compared to potable water. This may concern facility managers considering conversion to recycled water, but several technologies exist to control these issues and are currently used in both recycled water and potable water cooling towers. Furthermore, higher concentrations of nitrates and phosphates in recycled water can be favorable to a cooling tower system because of their ability to inhibit corrosion.

Table 4-5. Water Quality Parameters of Concern for Cooling Towers Using Recycled Water		
Water Quality Constituent	Operational Concern	On-Site Control Options
Ammonia	Biological fouling	Stripping
Carbonate, bicarbonate	Corrosion, scaling	pH control, antiscalant application
Calcium	Scaling	Ion exchange, electrodialysis reversal
Chloride	Corrosion	Chemical addition, on-site reverse osmosis
Magnesium	Scaling	Ion exchange, electrodialysis reversal, on-site reverse osmosis
Microorganisms	Biological fouling	Disinfection, mechanical cleaning, shock chlorination
Phosphates	Scaling	pH control
Silica	Scaling	Blowdown
Total dissolved solids	Corrosion, Scaling	Blowdown, on-site reverse osmosis

Proper design and management are essential to address each unique cooling tower system to successfully convert from potable to recycled water. Cooling towers that use potable water still require maintenance and normally some type of pre-treatment for their makeup water. Common chemical pre-treatment methods may include sulfuric acid addition to limit scale formation, zinc- or phosphate-based corrosion inhibitors or disinfectants to control biofouling. Non-chemical treatment systems and monitoring equipment from cooling tower manufacturers are also available to supplement or replace chemical treatment methods.

In many cases, converting an existing cooling tower from potable water to recycled water can be accomplished with little change to the existing cooling tower system or operation. Modifications to chemical treatment or additional coatings on specific cooling tower parts may be necessary. A recycled/potable blending approach can be used to gradually adjust to the new source of makeup water. System manufacturers should be closely involved with retrofit projects to ensure appropriate measures are taken to continue successful operation with recycled water.

The San Diego County Water Authority has established a Recycled Water Market Development and Technical Assistance Program to provide guidance and specific process recommendations to facilities interested in connecting to recycled water for cooling towers, irrigation or other applications. The program provides valuable resources such as technical assistance from experts in cooling tower operation, information data sheets, detailed case studies, industry workshops and site inspections.

Biogen Idec, a San Diego company, has successfully converted to a recycled water cooling tower operation with minimal changes to their equipment or operation. A recycled/potable blending approach was utilized where initially a small percentage of recycled water was used and then gradually increased. Currently, the facility uses 80% recycled water for their cooling tower makeup supply but will eventually increase to 100% recycled water. Table 2-2 presents facilities that have converted or are in the process of converting to a recycled water cooling tower system.

4.4.1.2.2 Identification of Cooling Towers

The Industrial Wastewater Control Program (IWCP) database (FY 2008 – 2009) obtained from the City was used to identify existing cooling towers that could potentially convert to recycled water. The database lists facility wastewater flows categorized by process name. Facility entries associated with cooling tower processes (i.e., cooling tower bleed, cooling tower evaporation, cooling tower loss, etc.) were totaled for each facility. These entries were cross referenced with a list of existing cooling towers that already use recycled water and removed from the database if they currently use recycled water.

Cooling tower evaporation rates or losses are monitored and listed separately in the IWCP database. The combined flow makeup flow and evaporation loss for each cooling tower was used as the total cooling tower demand for this market assessment. The City does not charge sewer fees to dedicated meters for cooling towers or for cooling towers fed from recycled water irrigation meters.

Several of the identified cooling tower facilities combined their cooling tower and boiler flow rates into one entry within the IWCP database. Since recycled water can be used in boilers and further investigation is required to determine the actual proportions of boiler feed and cooling tower makeup water, the combined flow rate as listed in the IWCP database was used for the demand estimate.

Facilities with cooling towers are more likely to convert from potable to recycled water if they can use recycled water for additional purposes such as irrigation. Therefore, cooling tower facilities that also have dedicated irrigation meters or that already use recycled water for irrigation were identified from the recycled water and irrigation databases. These facilities were considered more probable for cooling tower conversion to recycled water.

After all cooling towers were identified and georeferenced, the database entries were combined with the PWC database to estimate the potential potable water demand offset for the City. For cooling towers, it is assumed that 100% of the total water usage can eventually be converted to recycled water. A recycled/potable water blending approach may be used initially to mitigate some of the operational adjustments that may occur during conversion as a precautionary measure; however it is assumed that the blending of potable water will decrease over time until only recycled water is used.

Using information from the IWCP database, 158 facilities that use potable water for a cooling tower operation were identified. Table 4-6 shows the distribution of cooling towers based on their demand. Seventy-four cooling tower facilities with demand over 5 AFY (0.005 mgd) were geospatially referenced for display in the location map (Refer to Section 4.2.2.2).

A list of the cooling tower facilities can be found in Appendix H. The list presents facility address, demand, and if an irrigation meter using recycled or potable water is installed onsite.

Table 4-6. Summary of Cooling Towers Identified for Potential Conversion to Recycled Water		
Annual Demand (AFY)	Number of Cooling Tower Facilities	Total Demand Within Range (AFY)
< 5	84	113
5 - 10	21	151
10 - 20	23	326
20 - 100	27	999
> 100	3	581
Total	158	2,170

Approximately 15 of the identified cooling tower facilities combined their cooling tower and boiler flow rates within the IWCP database. Recycled water can be used in boiler feed supply, but typically requires a higher level of treatment than cooling tower makeup. This additional treatment cost would be borne by the customer. Further investigation with each organization is required to determine what percentage of flow is associated with boiler demand. In this market assessment, because boiler and cooling tower demands would differ between customers, the combined flow for boiler feed and cooling tower was used as the demand value. Note that this assumption applied only to a small portion of all cooling towers identified.

Cooling tower facilities that have a dedicated irrigation meter were considered more likely to connect to the recycled system because they can use recycled water for more than one application. The list of 74 cooling tower facilities with demands over 5 AFY were cross referenced with the irrigation database and recycled water database. It was determined that three of the cooling tower facilities use recycled water for irrigation and 20 use potable water for irrigation. The three facilities which already use recycled water for irrigation (Advanced BioHealing, Artes Medical, and Pfizer-La Jolla Laboratories) are especially strong candidates for cooling tower conversion.

4.4.1.3 Other Uses

In addition to irrigation customers, two types of customers were also identified in the PWC Database that could potentially switch to recycled water: car washes and commercial laundry facilities. The following sections summarize the results of this additional analysis and the decision not to include these additional uses in the market assessment.

4.4.1.3.1 Car Washes

There were 26 meters identified that serve car washes within the PWC Database, with a total annual demand of 103 AFY. Most car washes in San Diego County already recycle the water from the final car rinse for use with the first car rinse. Recycled water has been used for car washes in the Marin Municipal Water District in California, but requires onsite reverse osmosis and two-stage pre-filtration and ion exchange to reduce the total dissolved solids in the recycled water and prevent “spotting” (Arris Pty Ltd, 2005). Due to the requirement of on-site treatment and the limited water demand offset for connecting car washes to recycled water, they were considered low priority and were not included in the market assessment of potential recycled water uses.

4.4.1.3.2 Commercial Laundries

There were 12 water meters identified that serve textile and uniform companies within the database, with a total demand of 177 AFY. Onsite recycled water for textile and laundry facilities has been conducted previously, facilities required onsite treatment and used the recycled for the initial rinse (Ahmad et al., 2008, Van der Bruggen, 2005). Other issues include the installation of dual piping (potable and recycled) in the facility and providing hot and cold water for both. Due to the water quality requirements and limited water demand offset for connecting laundromats and textile facilities to recycled water, they were considered low priority and were not included in the market assessment of potential recycled water uses.

4.4.1.4 Water Purveyors within Participating Agencies’ Jurisdictions (Wholesale)

As stated in Section 4.3.4, a survey of water purveyors operating within the PAs of the Metro Wastewater JPA was conducted to identify potential recycled water demands from other regional wholesale customers. There are four wholesale customers that are currently served or could be served by the existing distribution systems and the potential new systems. These include the following:

- Olivenhain Municipal Water District
- Otay Water District
- City of Poway (North)
- Santa Fe Irrigation District

California-American was an additional potential wholesale customer identified with an estimated demand of 460 AFY (0.41 mgd) for the City of Coronado, and 920 AFY (0.82 mgd) with potential Navy demands. However, these demands are not included in further market assessment analyses since the Navy may construct their own plant to meet both Navy and City of Coronado non-potable reuse demands.

Olivenhain Municipal Water District

Olivenhain Municipal Water District (OMWD) is projected to have a total demand to be served by the NCWRP of 1,100 AFY by 2015 (see Table 2-6). The OMWD completed survey reports that they anticipate using 1,000 AFY by 2035. Therefore, OMWD is assumed to have no additional demands beyond 2015 that should be considered.

Otay Water District

Otay Water District has completed non-potable recycled water use projections through 2040. As described in Section 2.2.2, Otay Water District’s contractual demand through 2026 is assumed to be part of the SBWRP baseline demands.

As shown in Table 4-7, the potential Otay Water District demand through 2040, above the 2026 contracted demand, is 4,263 AFY. Assuming Otay Water District will be able to supply 900 AFY of that demand using

recycled water production from the Ralph W. Chapman Water Recycling Facility (RWCWRF), the demand gap is reduced to 3,363 AFY (3.0 mgd).

Table 4-7. Otay Water District Demands Beyond Baseline (2026)		
Area/Component	Average Annual Demand	
	AFY	mgd
SBWRP w/Potential Additional Otay Water District Demand by 2040		
Otay Water District Projected Total 2040 (High Confidence)	10,110	9.0
Otay Water District Contract (Included in Baseline Demand)	5,847	5.2
Additional Otay Water District by 2040 (Above Baseline Demand)	4,263	3.8
Available Supply from RWCWRF	900	0.8
Potential Additional Otay Water District by 2040 (Above Baseline Demand)	3,363	3.0

City of Poway

Poway has indicated in their survey response that they would have additional recycled demands of 1,100 AFY through a northern connection through Rancho Bernardo. These demands are multiplied by the probability of connection factor (77%) to estimate a realistic approximation of demand of 847 AFY. Refer to Section 5.2.1 for additional information on assumed probability of connection factors.

Santa Fe Irrigation District

The Santa Fe Irrigation District indicated in their survey response that their future non-potable demands are as follows:

- 150 AFY for near-term plans to expand existing distribution system
- 700 AFY for long-term plans to serve the eastern portion of the Santa Fe Irrigation District service area
- Total = 850 AFY

Santa Fe Irrigation District also indicated that these demands could also be served with recycled water from the San Elijo Water Pollution Control Facility. A 50% adjustment factor is applied to the Santa Fe Irrigation District demands to reflect the uncertainty of the source of recycled water (City or San Elijo). Therefore, a future demand of 425 AFY (850 AFY times 50% adjustment factor) is assumed for Santa Fe Irrigation District.

4.4.2 Initial Market Assessment Results (Step 1)

This section documents the results of the initial market assessment analysis, which identifies all potential non-potable reuse demands in the entire City's service area and surrounding water agencies. Results are summarized in tables and illustrated in maps. Once all potential demands are identified as part of Step 1, subareas are delineated to focus non-potable reuse opportunities in concentrated areas. Section 5 presents distribution system concepts and the refined market assessment (Step 2).

4.4.2.1 Summary Tables

The potential irrigation only and cooling tower customers are summarized in Appendices G and H, respectively. These do not include baseline demands, which are summarized in Section 2. In addition, the total potential recycled water demands within the City and the PAs are summarized in Tables 4-8 and 4-9. These are the total potential recycled water demands if the City was able to provide recycled water distribution throughout the entire City to serve every demand, which is not possible. The actual potential recycled water demand will be dictated by the distribution system alternatives presented in Section 5. Refer to Figure 2-1 for the service area delineations.

4.4.2.2 Maps

The initial market assessment results are presented graphically in two ways: location map indicating the individual recycled water users and the potential recycled water demand, and a recycled water density map showing area-weighted demands.

4.4.2.2.1 Location and Demand Map

After identification of all potential recycled water customers was made, the locations of the potential irrigation customers, cooling towers, and wholesale customers that had a potential recycled water demand greater than 5 AFY were plotted using Geographic Information System (GIS) technology, and are shown in Figure 4-4. The size of each user corresponds to meter's potential recycled water demand. The classifications are 5 to 10 AFY, 10 to 20 AFY, 20 to 100 AFY, and demands greater than 100 AFY. For simplicity, the potential demands less than 5 AFY are not shown in Figure 4-4, but these demands will be included in the overall potential demand calculation when determining the potential recycled water demands for the distribution system alternatives.

Identification numbers are included for customers with potential recycled water demands greater than 20 AFY. The identification numbers are shown in Table G-1 (Appendix G) for irrigation customers and Table H-1 (Appendix H) for cooling towers.

4.4.2.2.2 Recycled Water Density Map

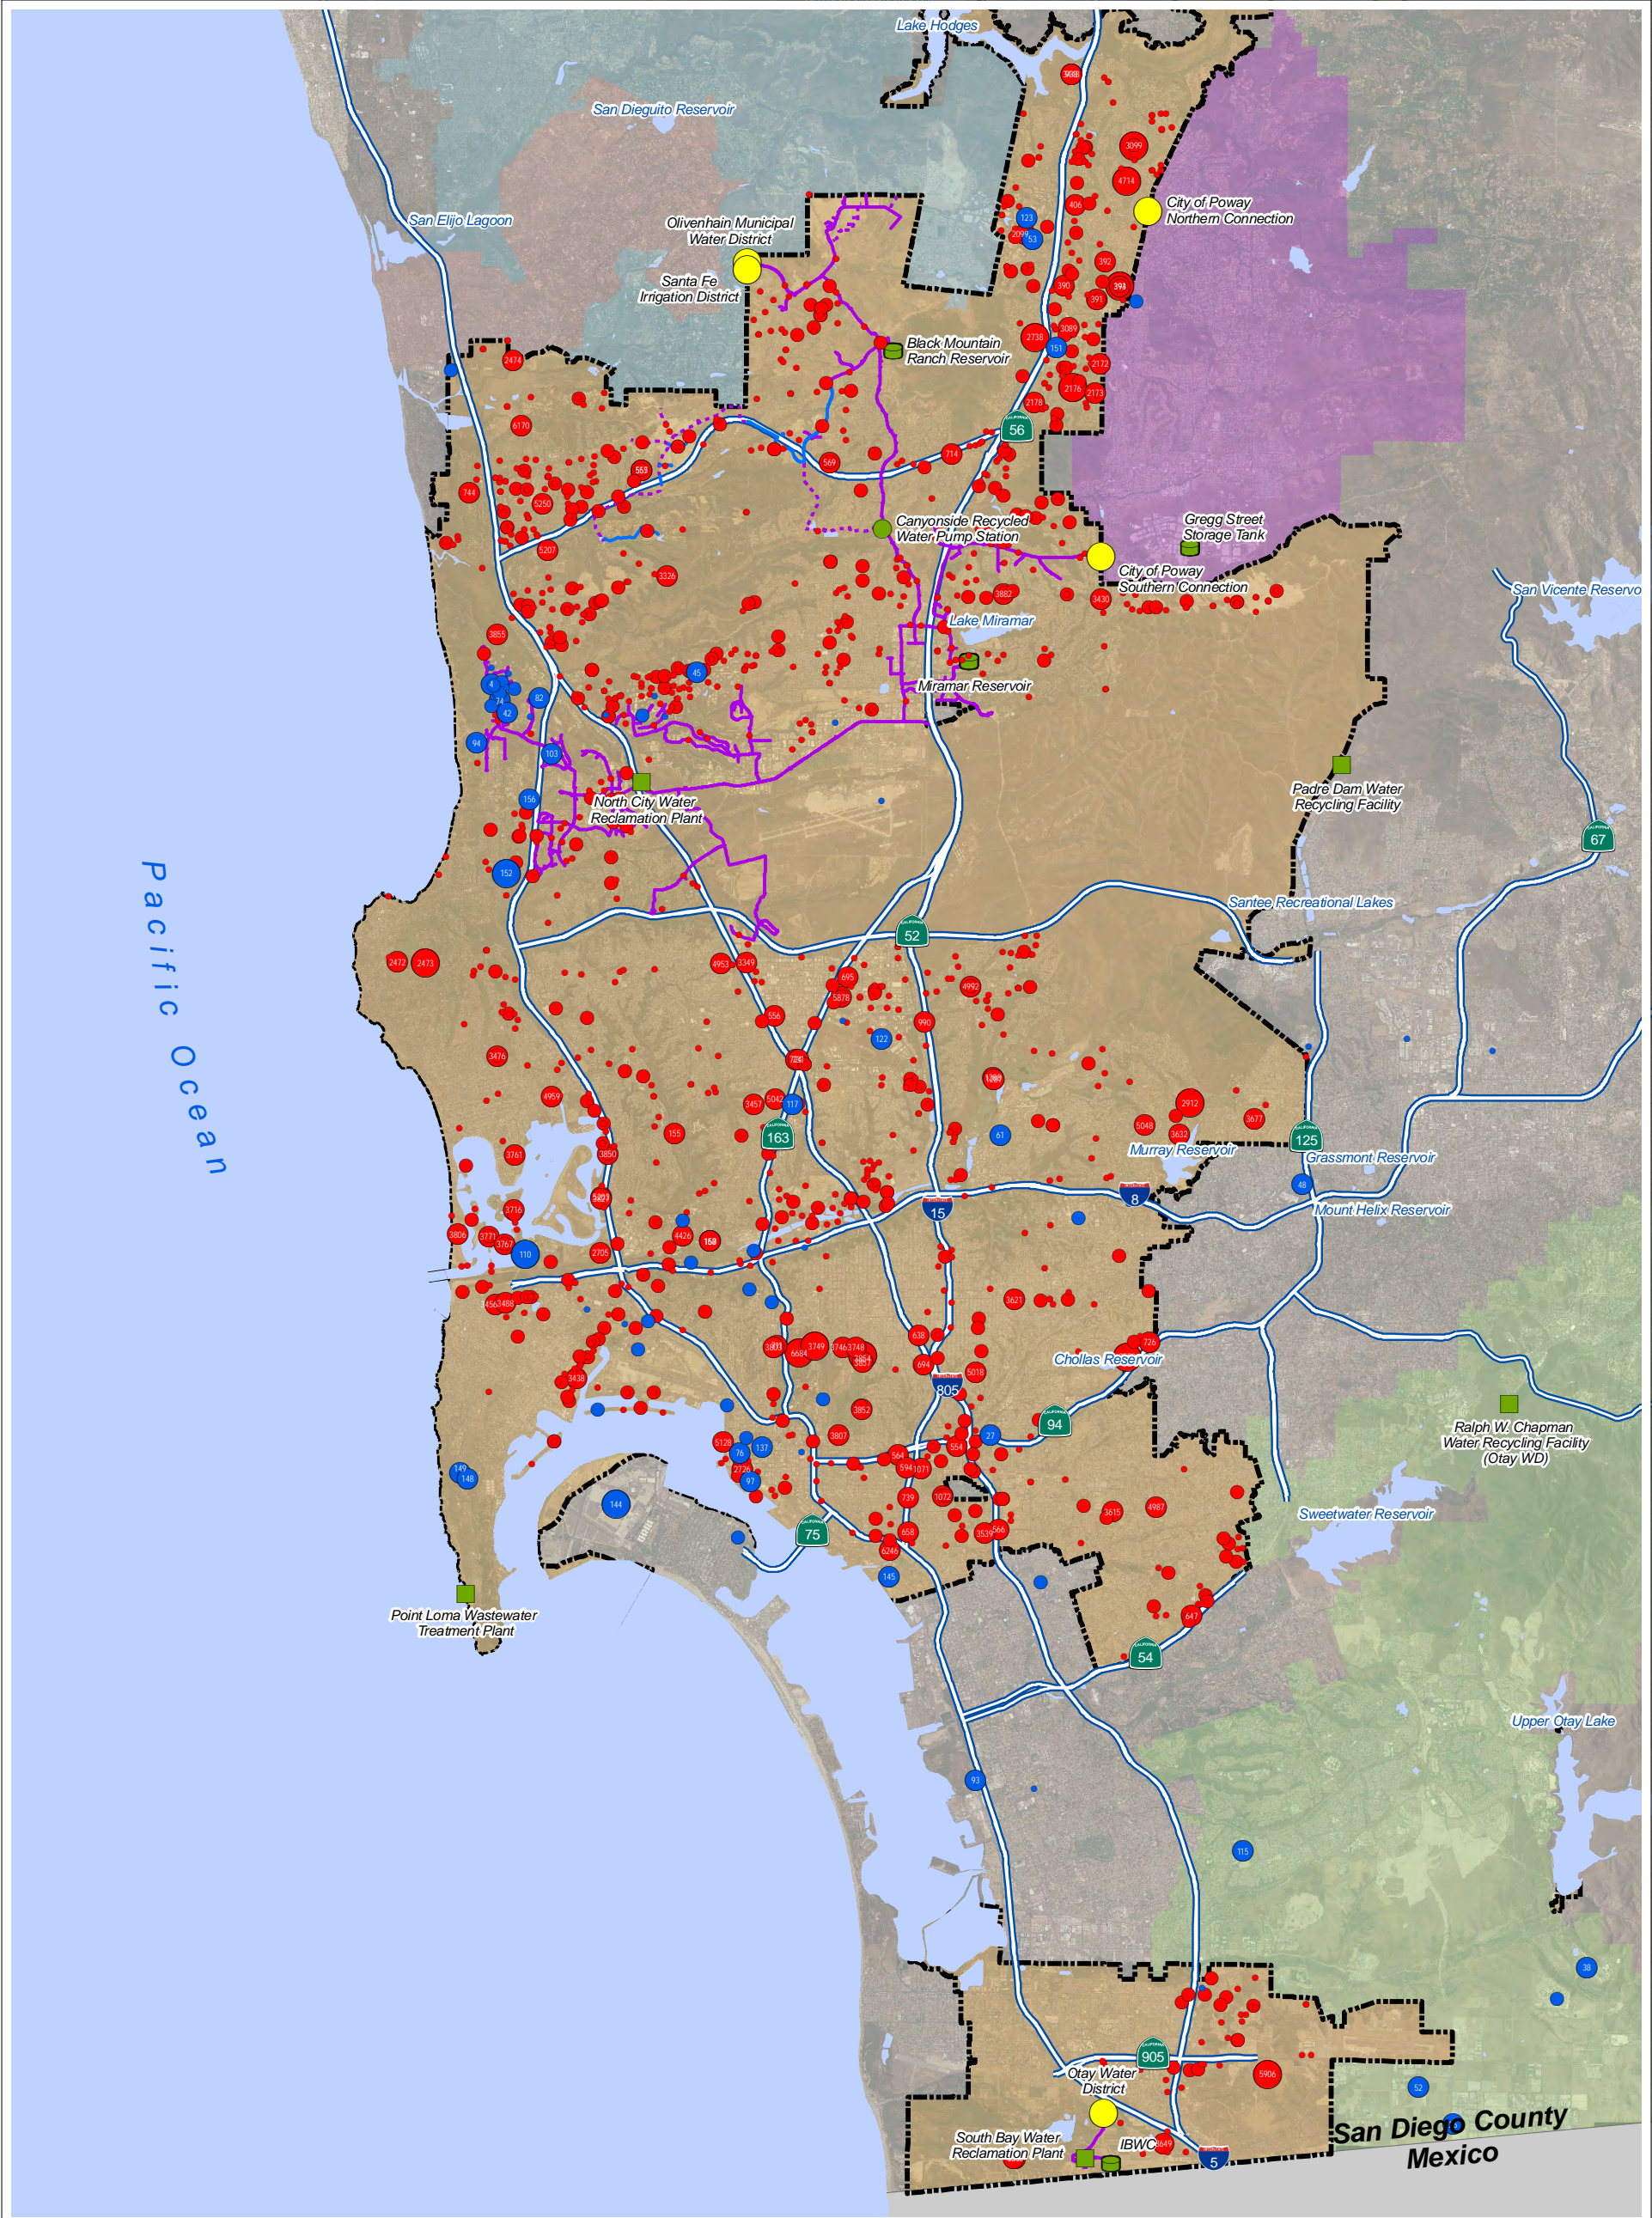

Using the data for all potential customers, a recycled water density map of annual demands over area was created using GIS technology. This map provides a visual representation of area-weighted demands that incorporates all potential recycled water customers, those identified through the irrigation, cooling towers, and wholesale demand analyses, including those with demands less than 5 AFY.

The recycled water strategy map was created using the Density function in ArcGIS, which is used to create grids of the density of all potential recycled water customers within a specified radius. For a given cell, the function uses a moving window that counts the population of all items that lie within the window boundary. The function then divides the sum population by the total area of window. The resulting value is assigned to the cell, and the procedure continues to the next cell.

For this analysis, the annual demand was used as the population to create a density map of the potential water usage demands. The grid size assigned for the analysis was 200 ft x 200 ft square cells, and the boundary area was assigned a circular window with a 0.5 mile radius. A representation of the density analysis methodology and an equation demonstrating the calculation steps are shown on Figure 4-5. In the figure, the selected cell sums up the demands located within 0.5 miles of the cell. For this example, there are three water meters with a total sum of 55 AFY. The function then divides the demands by the window area, which would result in 70 AFY/sq. mi.

Once the Density function is complete, the grid is spatially superimposed and values graphically displayed on the map. The color scale for the grid values is displayed linearly for values greater than 0 and less than 400 AFY/sq. mi., and is constant for higher values. A representation of the color scale is shown in Figure 4-6. Refer to Section 4.5 for the Density Map.

4.5 Non-Potable Reuse Demand Focus Areas

Using the Density Map, the overall service area was disaggregated into generalized smaller focus areas for further alternatives analysis. The purpose of disaggregating the demands was to provide more specific areas to focus potential recycled water system expansions and evaluate the benefits and tradeoffs for pursuing different geographic areas. Seven main focus areas were identified for further evaluation, along with available water supply sources (refer to Section 3), and are described below.

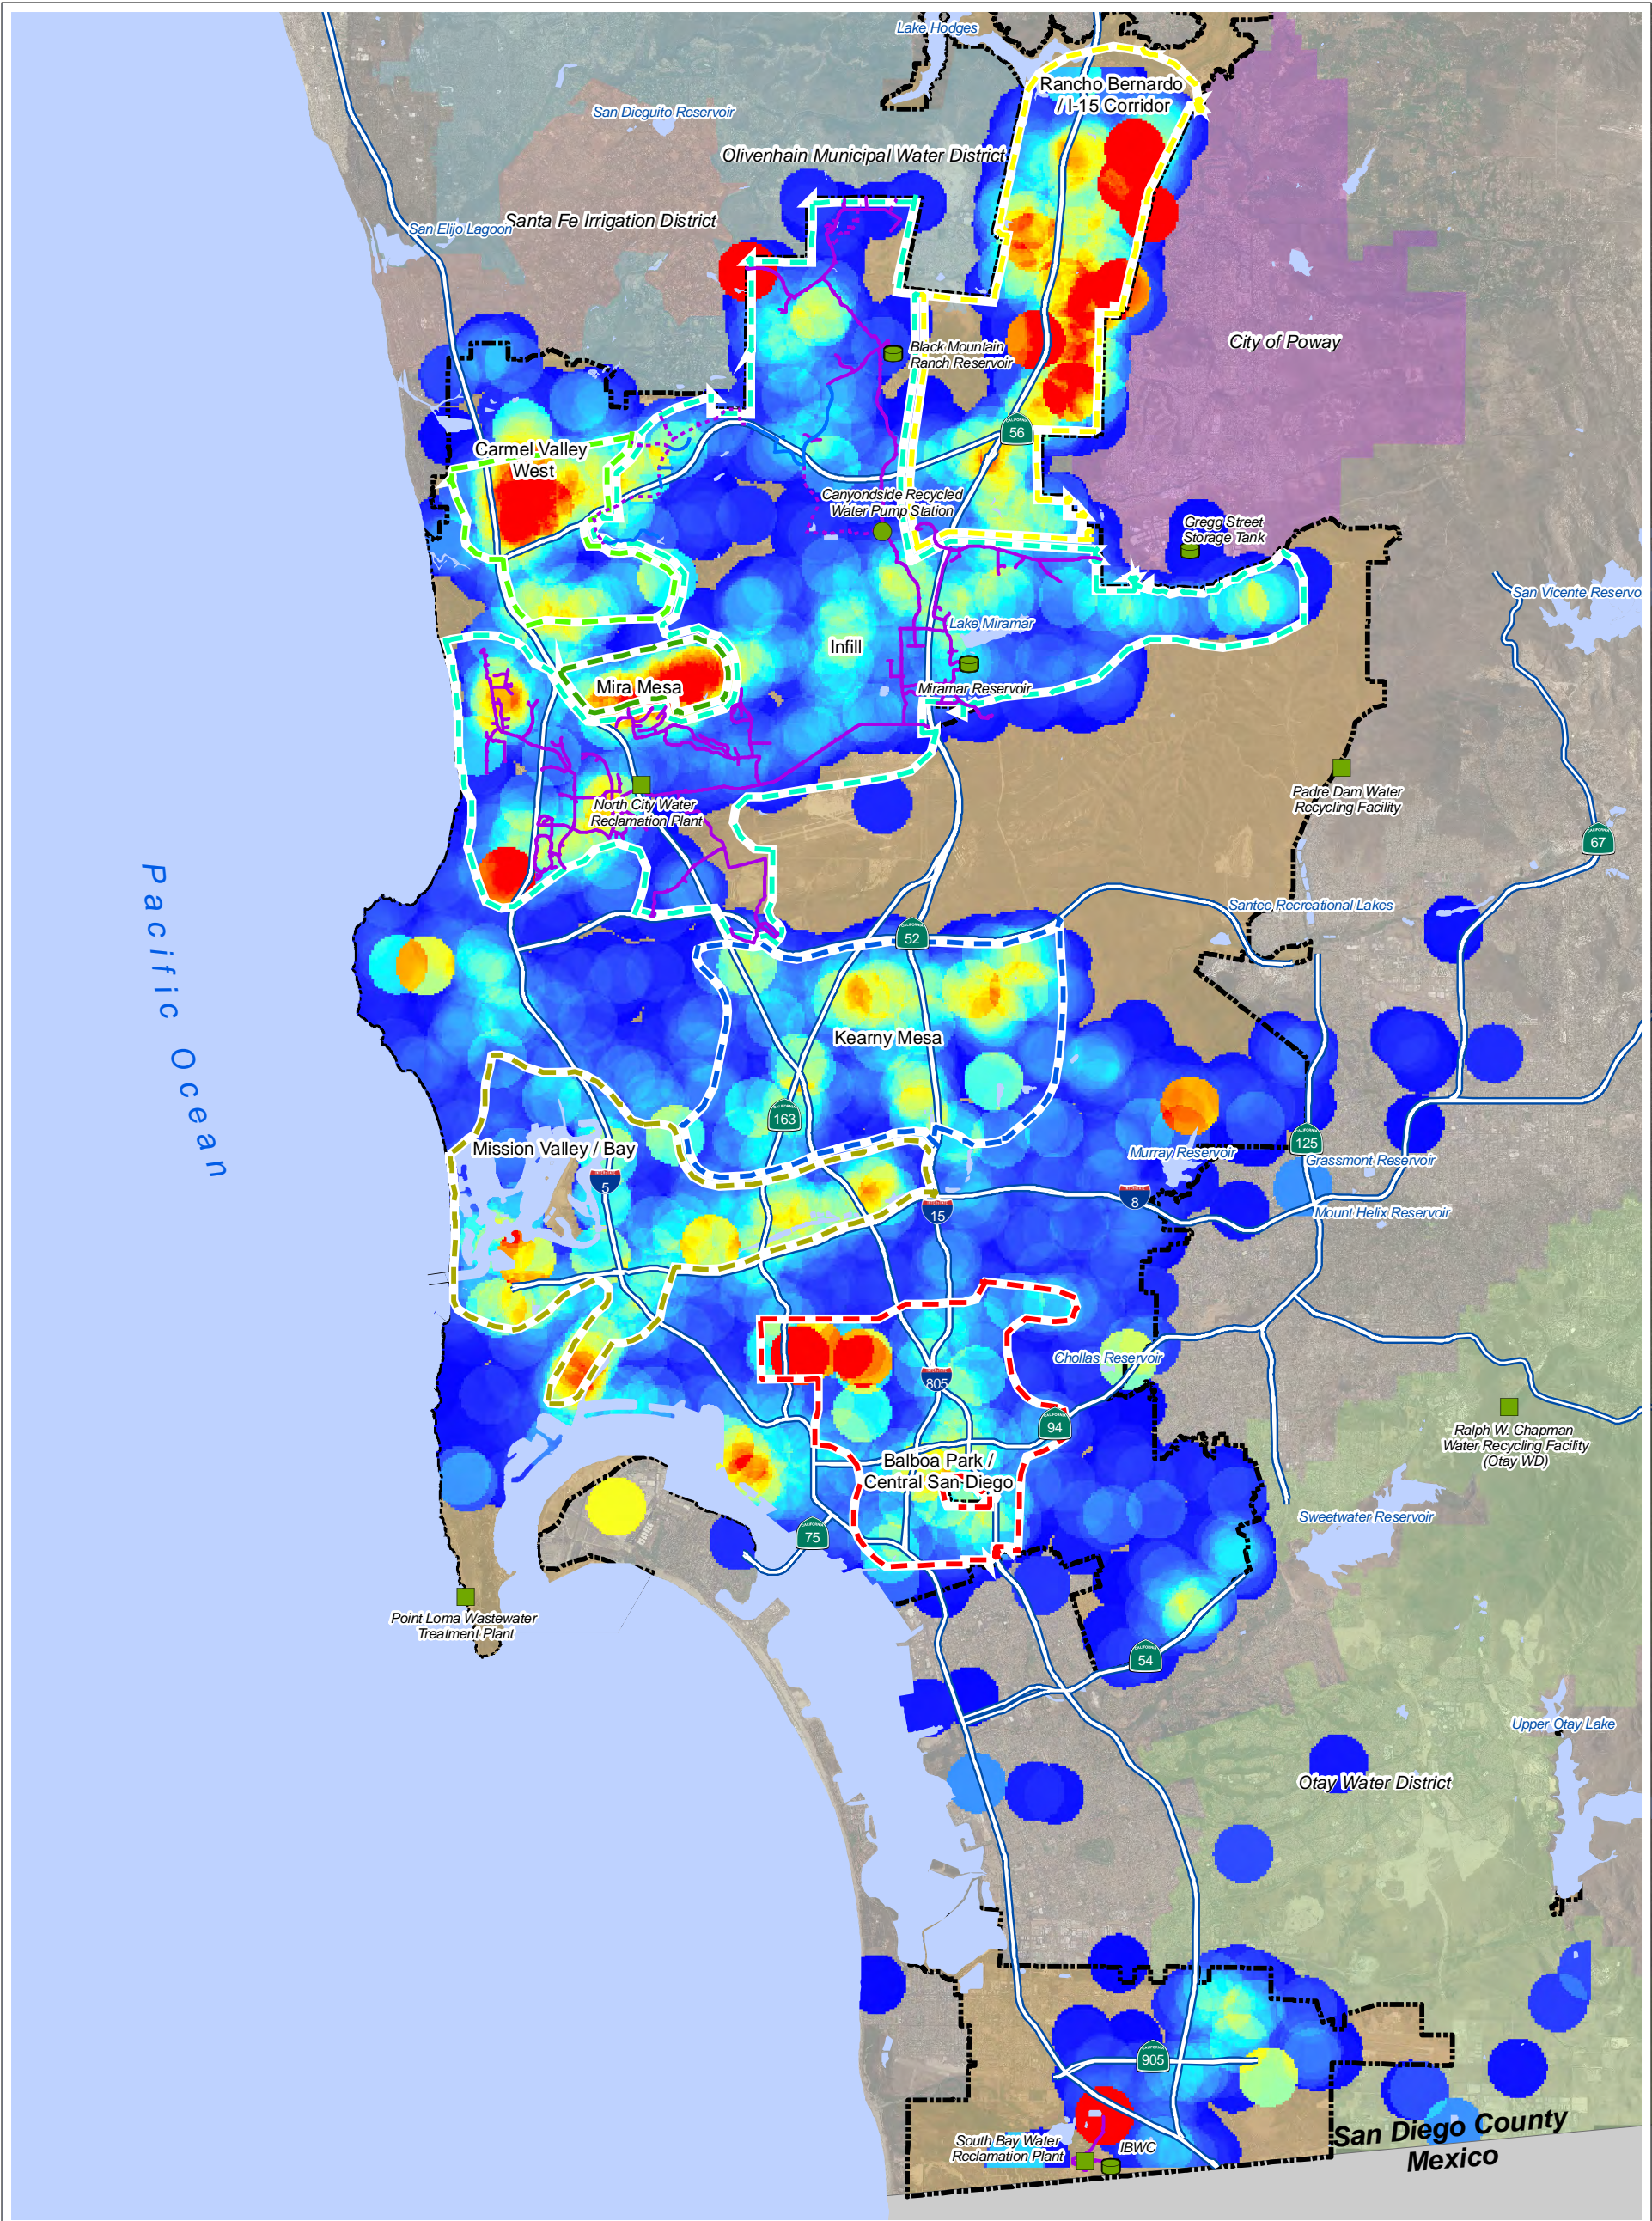

Some focus areas could potentially be served either by NCWRP or new satellite plants. Further evaluation is needed to determine the supply strategy for these areas. It is important to recognize that any options proposing supply from NCWRP also require further evaluation (including hydraulic analysis) of existing treatment and distribution system infrastructure to determine facility improvements required for the existing system to accommodate additional demands (refer to Sections 5 and 6).

- **Infill:** This area focuses on additional demand that could be picked up along the baseline recycled water system. The subarea is located in the north of the 52 freeway, spanning from the coastline to east of I-15. Recycled water could potentially come from NCWRP.
- **Carmel Valley West:** This focus area is located near the 56 and I-5 intersection. Recycled water could potentially come from the NCWRP.
- **Mira Mesa:** This focus area is located north of the NCWRP. Recycled water could potentially come from NCWRP.
- **Rancho Bernardo/I-15 Corridor:** This focus area encompasses the northeastern portion of the City's service area. Recycled water could potentially come from the NCWRP or from a satellite plant located east of Lake Hodges.
- **Kearny Mesa:** This focus area is located south of the 52, near I-805 and I-15. Recycled water could potentially come from the NCWRP or from a satellite plant located near Qualcomm stadium.
- **Mission Valley/Bay:** This focus area is located primarily around Mission Bay and extends to Qualcomm Stadium. Recycled water could potentially come from the NCWRP or from a satellite plant located near Qualcomm Stadium.
- **Balboa Park / Central San Diego:** This focus area is located south of I-8 and in close proximity to Balboa Park. Recycled water can be provided either from could potentially come from the NCWRP or from a satellite plant located near Balboa Park.

Figure 4-7 shows the Density Map with demand area boundary delineations and geographic locations of each focus area. A conceptual sources and sinks diagram illustrating the available sources to each demand area is presented in Figure 4-8.

Note that some potential demands in the southern service area near SBWRP were identified (see Figure 4-7). However, this area was screened out from further evaluation of the City's recycled water distribution system expansions since the magnitude and concentration of the demands were low compared with other areas. The City plans to use up the 1 mgd conveyance capacity for retail deliveries, and there is potential to serve additional Otay Water District demands. Additional future retail demands served by SBWRP should be revisited in future planning studies.

Wholesale demands were considered when analyzing demands for the focus areas in order to determine appropriate preliminary pipe alignments and sizing. Three agencies have expressed interest in additional water purchases from the City in the future: Santa Fe Irrigation District, Poway, and Otay Water District. A summary of future wholesale demands and their respective demand focus areas are shown in Table 4-10.

Table 4-10. Wholesale Demands and Focus Areas

Wholesale Agency	Potential New Demand (beyond 2015), AFY	City Demand Focus Area	Notes
Santa Fe Irrigation District	425	Infill	Potential new customer that could be connected to the Northern Service Area (through Olivenhain Municipal Water District's connection in the Infill area)
Olivenhain Municipal Water District	0 (demand not anticipated to increase between 2015 and 2035)	Infill	Existing customer connected to the Northern Service Area (Infill area).
Poway	847	Rancho Bernardo/I-15 Corridor	Potential new connection in the northern Poway area that could be served by a Rancho Bernardo non-potable reuse distribution system
Otay Water District	3,363	Recycled water distribution expansion to serve non-potable demands within the City's southern service area has been screened from further evaluation. Any additional non-potable demands potentially served by South Bay WRP would be in Otay Water District service area.	Existing customer supplied by SBWRP

4.6 Summary

The initial market assessment identified all potential recycled water demands for irrigation and cooling tower applications within the City's service area as well as future wholesale demands. A Density Map was created to visually represent areas with concentrated potential demands, and focus areas were identified for expansions of the recycled water distribution system.

Section 5 presents non-potable reuse distribution concepts and a refined market assessment based on customers along corridors of proposed piping and probability of connection factors.

SECTION 5

DISTRIBUTION EXPANSION OPPORTUNITIES AND REFINED MARKET ASSESSMENT

This section presents expanded distribution system layout concepts, a refined market assessment (described as Step 2 in Section 4), as well as facility requirements and preliminary costs for each concept. All layout concepts are preliminary, and further evaluation is required prior to implementation of any of these concepts (as explained in Section 6).

5.1 Non-potable Reuse Distribution Layout Concepts

5.1.1 Methodology

Distribution system layout concepts are based on the demand focus areas identified in Section 4. When determining the distribution system layouts, extents of the distribution system alternatives were not constrained by supply option capacity. Once distribution layout concepts are identified, the supply available (Section 3) will need to be evaluated to determine which customers can be served (refer to Section 5.4).

The approach to determine distribution layouts was to extend pipe conveyance to potential non-potable customers with demands greater than 20 AFY. These customers served as “anchor points” for the system. Generally, customers with lower demands that are in close proximity to the pipeline would be connected as well, but the main conveyance system would not be extended to pick up these customers. However, there were exceptions in areas showing a high concentration of low demand customers that when combined, resulted in a large focused group demand. In these cases (which occurred in the Mira Mesa and Carmel Valley West areas), the pipe layout was extended to the highly concentrated areas of smaller demands.

Distribution system planning performed in previous studies provided a foundation for alignments proposed in this updated. Pipe extensions from NCWRP to the following areas are generally based on alignments identified in the 2005 RWMP: (1) Rancho Bernardo/I-15 Corridor area (known as Phase III pipelines in the 2005 RWMP), (2) Kearny Mesa, (3) Mission Valley/Bay, and (4) Balboa Park/Central San Diego.

5.1.2 Supply Scenarios and Layout Concepts

The distribution scenarios developed for each of the focus areas included in the 2010 RWMP Update are based on the supply options for recycled water. Two main supply options were considered:

- North City Water Reclamation Plant (NCWRP)
- New Satellite Plants

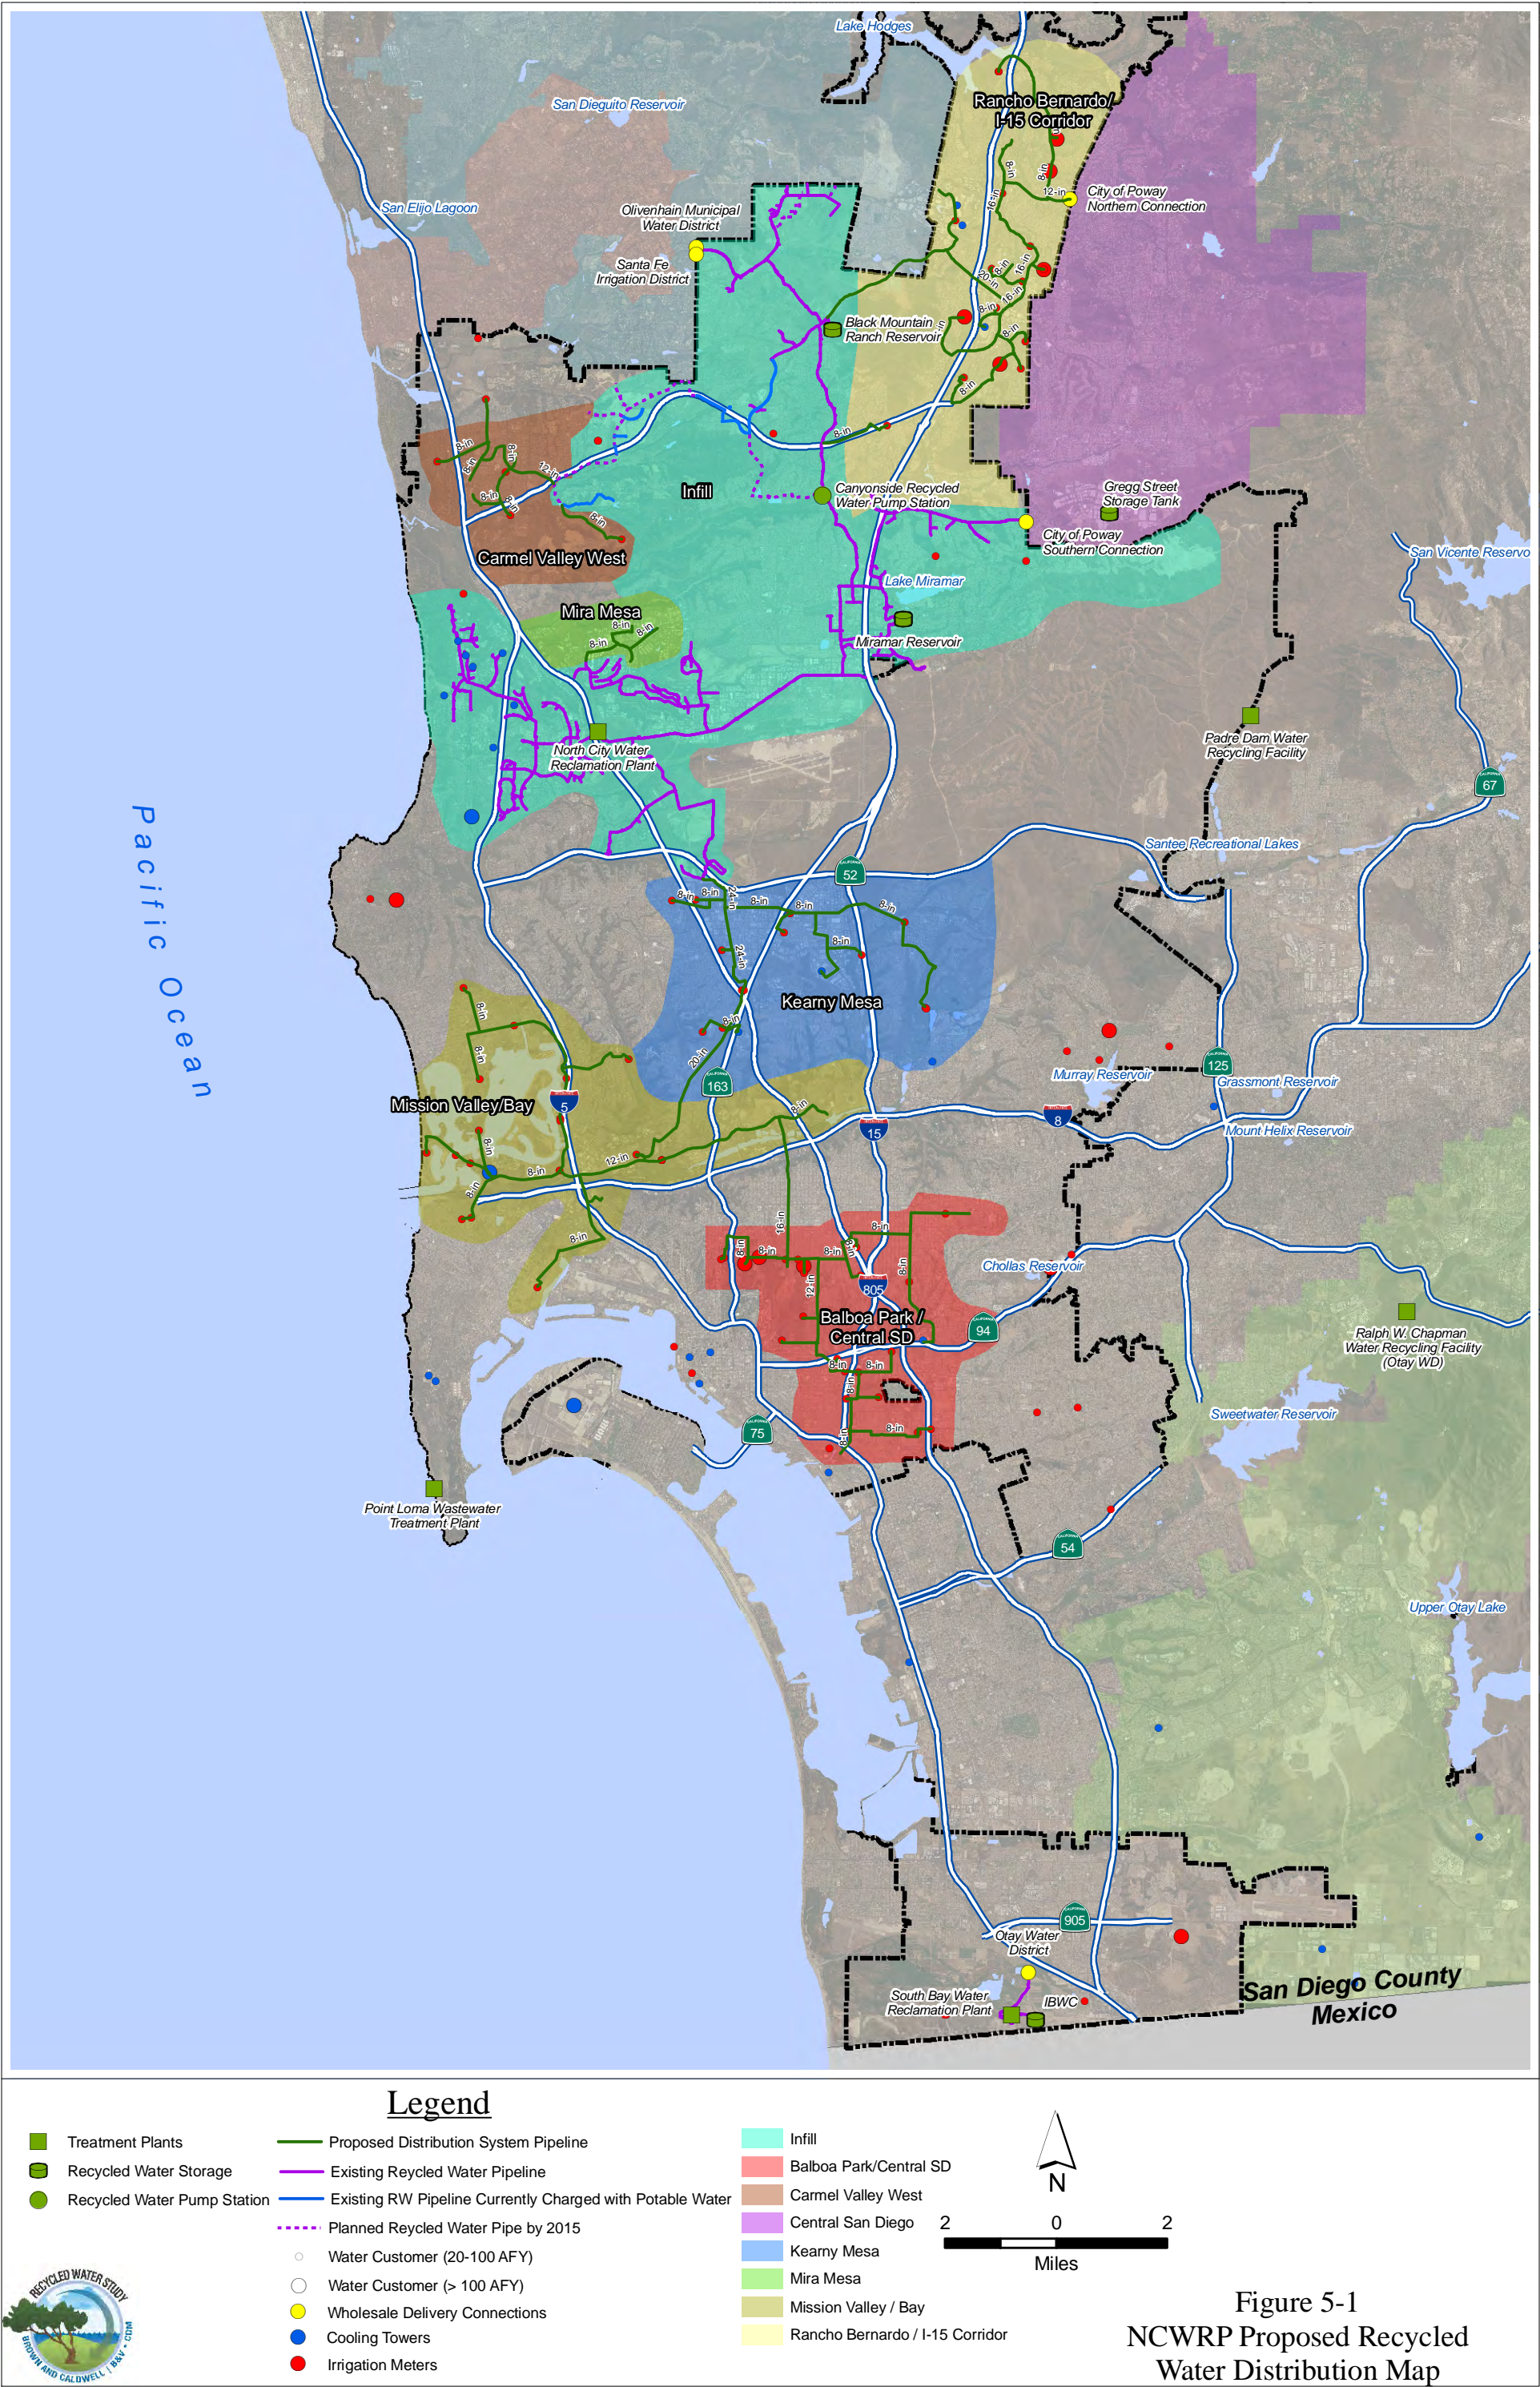

Note that supply from SBWRP to expanded non-potable distribution within the City’s service area was not included in this analysis as the majority of recycled water is sent to the wholesale customer, Otay Water District, and expansion of other retail customers is unlikely. A comparison of SBWRP supply with potential Otay Water District demands is provided later in this section (see Sections 5.4).

The NCWRP supply option assumes expansion of the existing distribution system. The satellite plant option involves construction of one or more satellite plants and construction of new recycled water distribution systems independent of the existing systems. The purpose of evaluating the source scenarios is to account for the differences in expanded distribution facility requirements to serve each demand focus area given

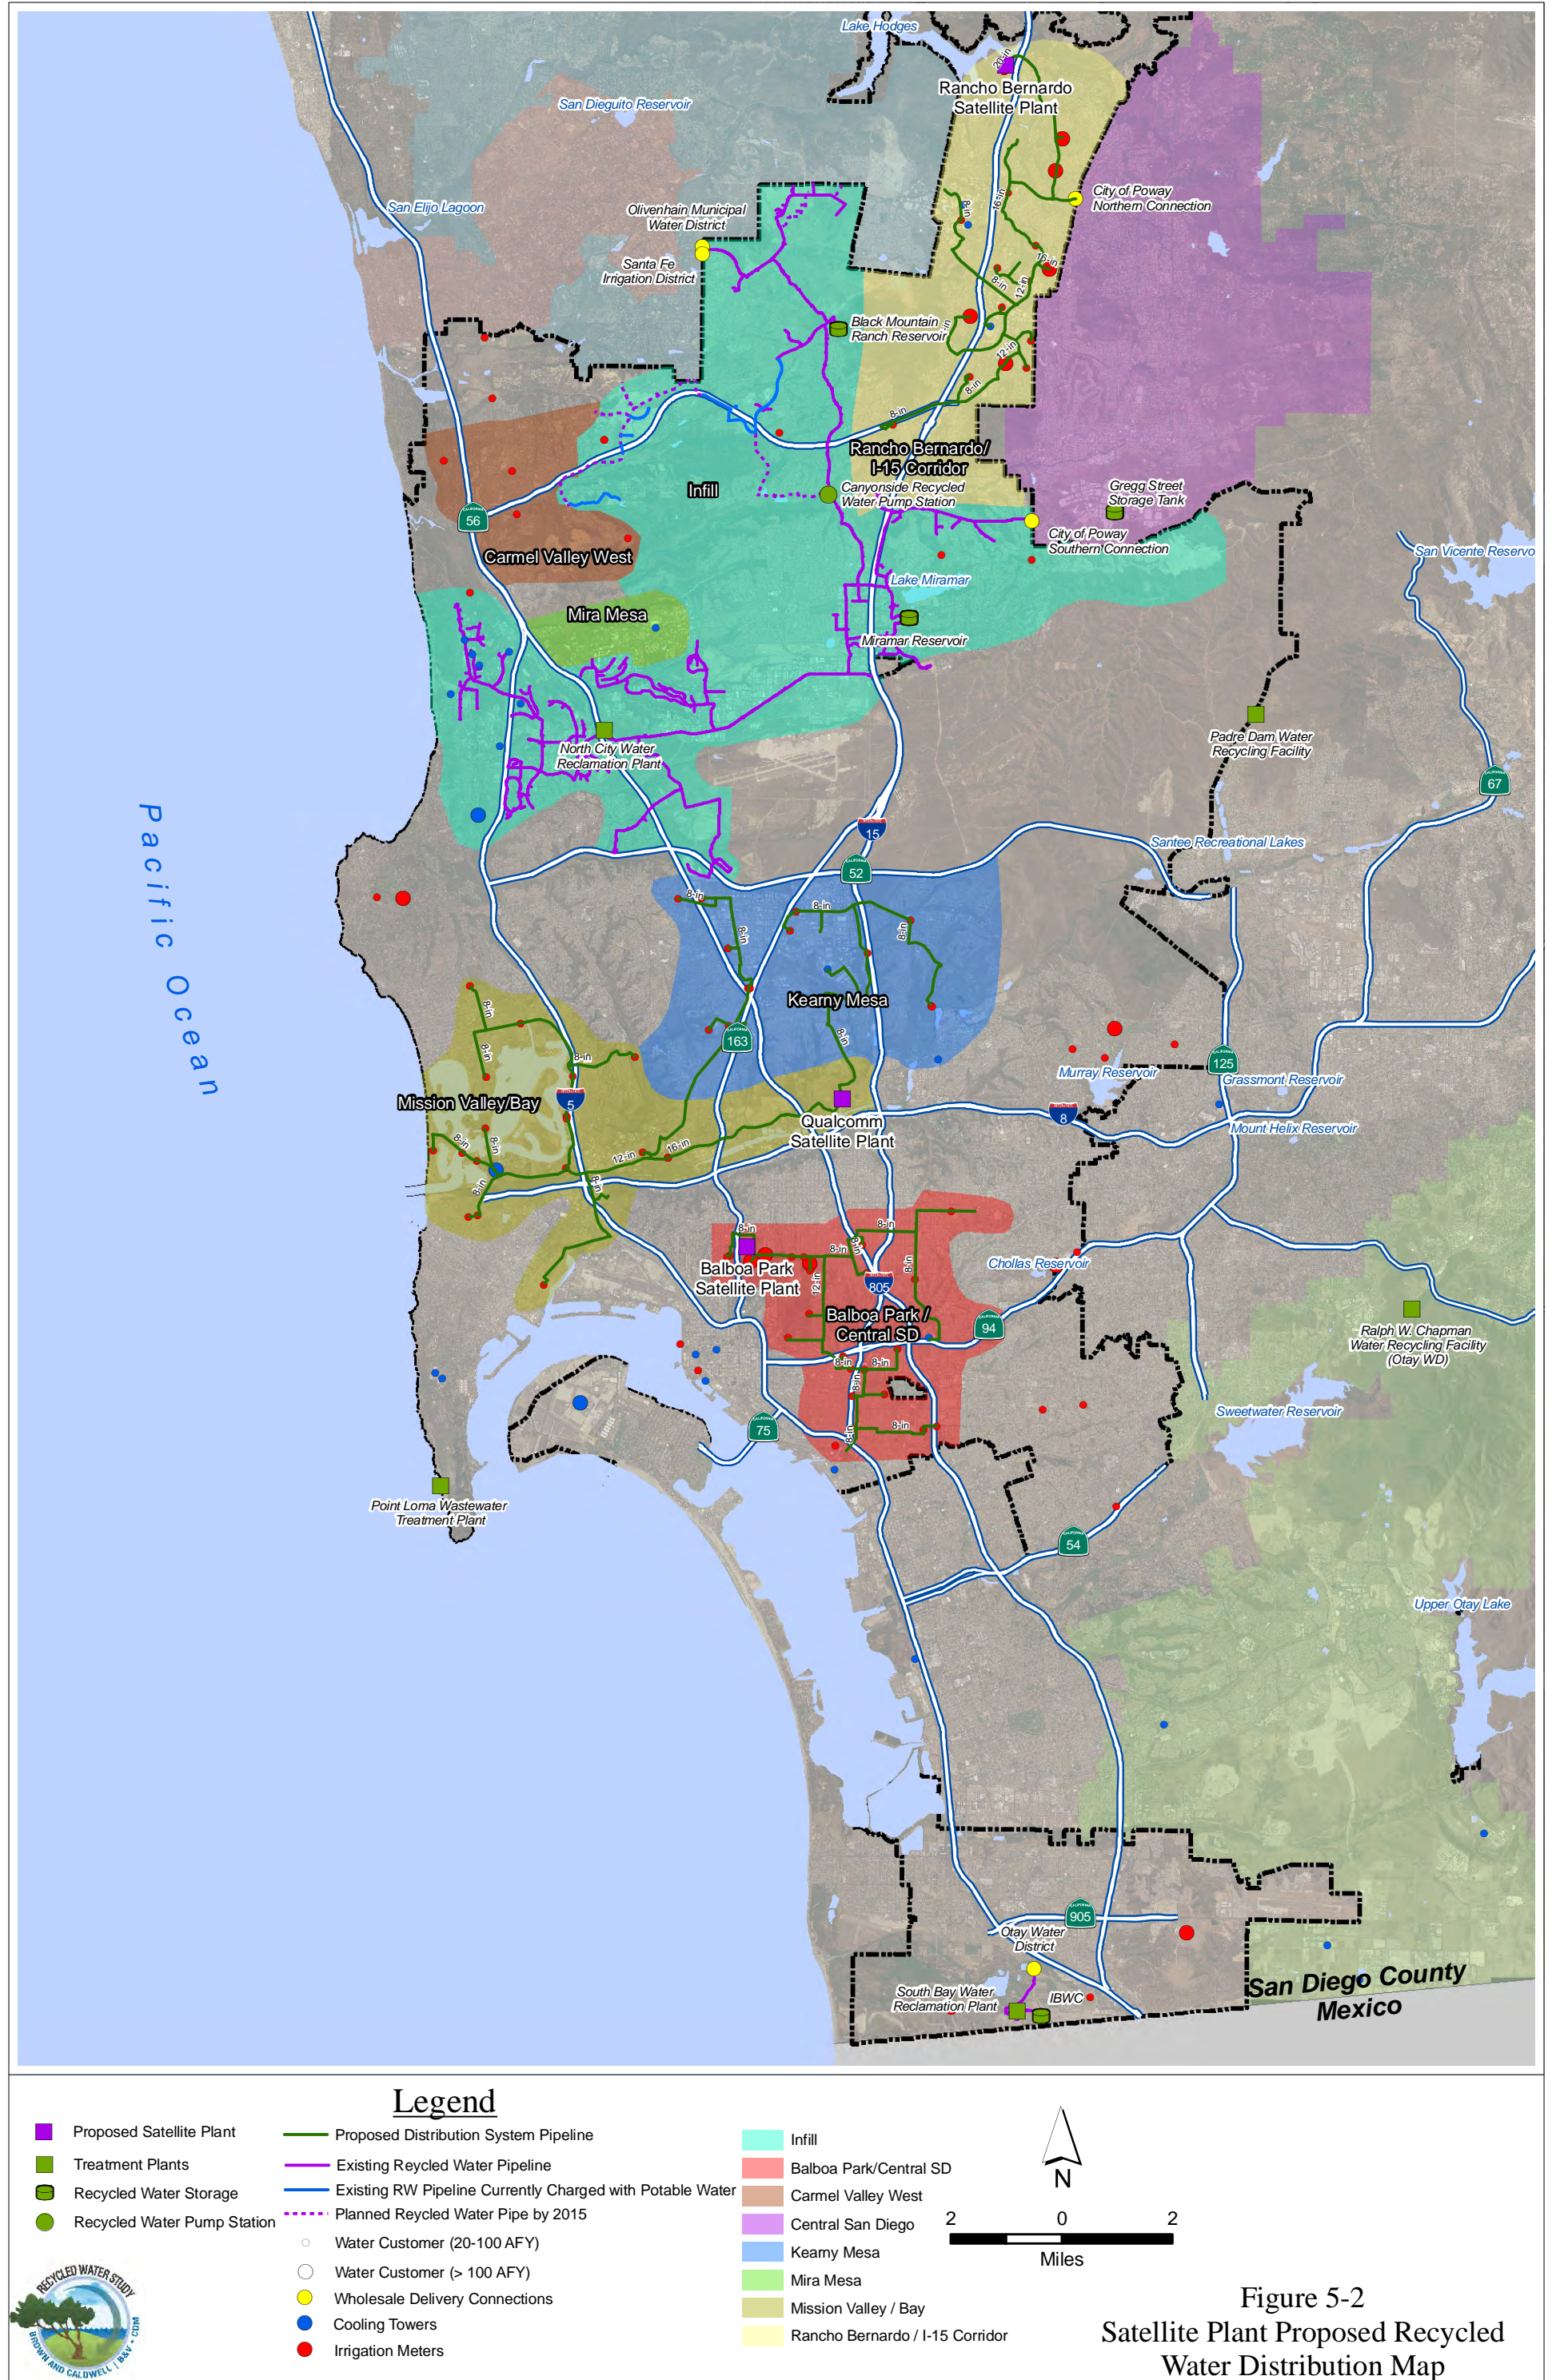

various potential sources of supply. Note any options proposing supply from NCWRP require further evaluation of existing treatment and distribution system infrastructure (including in-depth hydraulic analysis) to determine facility improvements required for the existing system to accommodate additional demands. The distribution system layout concepts for each supply scenario are presented on Figures 5-1 and 5-2.

This page intentionally left blank.

This page intentionally left blank.

5.2 Refined Market Assessment

Once the pipeline layout was created for each focus area (under each supply scenario), the total demand along the pipelines was calculated for potential customers within 0.05 mi and 0.25 mi from the pipeline. Demands were then analyzed to determine the probability of connection based on historical connection rates. This approach provides a more realistic estimate of the actual potential demand within each focus area.

Figure 5-3 displays the overall non-potable reuse market assessment process (described in Section 4), which is summarized as follows:

- Identify all potential demands for the City and potential wholesale demands (Section 4)
- Identify distribution system subareas using the density map (Section 4.5). The density map identified areas within the City with higher concentration of non-potable demands. This step screened out areas of the City with sparse non-potable demands that would likely not be cost-effective to serve with a new non-potable distribution system.
- Develop conceptual distribution system layouts for each of the subareas, and refine the potential demands to include customers within 0.25 miles of the proposed distribution pipe layouts
- Further refine the demands using the probability of connection factors. This probability of connection acknowledges that all of the potential non-potable customers identified within a subarea and near the new distribution systems will not connect to the system.

Figure 5-3. Future Retail Demands Assessment Process

5.2.1 Probability of Connection Factors

The City conducted an evaluation of the Tier 1 customers identified in the 2005 Recycled Water Master Plan to determine their current status, including reasons that customers did not connect to the system. The reasons included prohibitive installation cost due to the distance between an irrigation system and the existing recycled water distribution system; the City's recycled water distribution system had not yet been expanded to their area; and the site's irrigation needs had changed due to installation of artificial turf.

As evidenced by the City's existing system and customers, there will be potential retrofit customers along the recycled water distribution system who opt not to connect to the system for a variety of reasons, such as survey results identified in Appendix D. This issue can be difficult to account for in the planning process. These potential customers who do not connect to the system, and cannot be specifically identified until the distribution system is constructed, need to be accounted for to avoid overestimating the amount of Title 22 recycled water that could be utilized.

Therefore, this section presents the probability assessment that is used to provide a more realistic estimate of non-potable reuse demands. Historic connection and usage data from the City's existing recycled water

system was evaluated to develop a probability of connection factor that can be applied to new distribution system alternatives.

The City's existing Northern Service Area distribution system, including the planned expansions through 2015, was analyzed to determine probability of connection of the existing system by customer size (e.g., recycled water use). The intent is that the percent capture will be applied to the distribution system alternatives to estimate a realistic recycled water demand. It is important to note that all potential recycled water customers within a reasonable distance of the new distribution system will be encouraged to connect to the new distribution system; this percent capture attempts to give an indication of how many customers may actually connect to the system.

The existing system represents approximately a 20-year planning horizon as the existing distribution system started operation in 1997 and planned customers who will connect by 2015 have been identified. While there will likely be further expansions of the existing NSA distribution system, evaluating the customers through 2015 is a representative evaluation of how many customers could be expected to connect to a new distribution system within an approximate 20-year period.

A drawback of using the existing system as an indicator of the percent capture for a new distribution system is that there may be some limitations of the existing distribution system design that have restricted the City from connecting some customers to the system. For example, there are portions of the existing distribution system that lack local distribution pipelines/service connections needed in conjunction with the main transmission lines to connect customers in certain areas.

To estimate the probability of connection, the customer baseline (existing and planned) and potential recycled water customers within both 0.05-mile and 0.25-mile of an existing or planned recycled water (RW) pipeline were analyzed. The 0.05-mile represents that the distribution system is adjacent to the property. The 0.25-mile represents a maximum distance for a service lateral. The baseline and potential customers are defined as follows:

- Baseline recycled water customers: includes existing and planned recycled water customers that will be connected to the system by 2015 (see Table 2-5).
- Potential recycled water customers: includes irrigation customers identified from the PWC Database (see Section 4.2.2.1 for identification methodology and Appendix F for full irrigation customer database).

The percent capture reflects the fraction of baseline customers actually connecting to the system to total identified customers. The customers were sorted and categorized based on their water consumption into six intervals by water use and the percent capture was calculated for each interval. The results of the analysis are presented in Table 5-1 and Figure 5-4. For both distances, the data indicates that as the potential recycled water customer's demand increases, there is a greater likelihood that they will switch to recycled water. In general, the percent capture for customers within 0.05 mile is greater than 0.25 mile.

Table 5-1. Probability of Connection								
Based on Percent Capture of Customers along Existing and Planned NSA Recycled Water Distribution System								
Customer Demand Range (AFY)		0-1	1-5	5-10	10-20	20-100	100+	Total
Percent Capture of Customers	0.05 Mile from Pipeline	43%	48%	59%	71%	55%	77%	52%
	0.25 Mile from Pipeline	23%	32%	42%	56%	46%	71%	35%

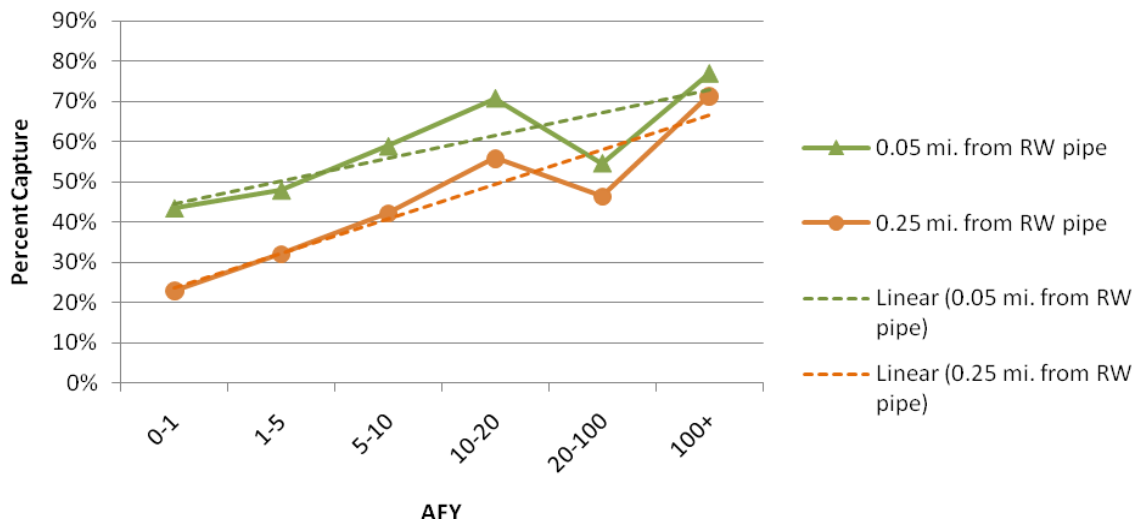

Figure 5-4. Probability of Connection
Based on Percent Capture of Customers along Existing and
Planned NSA Recycled Water Distribution System

There are some additional factors that should also be taken into account when estimating the non-potable demands for the new distribution system alternatives, which are summarized in Table 5-2. Examples include the forthcoming increase in the recycled water cost, which could dissuade some customers from connecting due to a longer payback period for onsite improvements; however, conversely the drought-proof aspect of recycled water may persuade some customers to connect. Even with these elements that could potentially impact the future non-potable demands, it is generally assumed that the estimated net effect is that the existing recycled water usage will stay the same or reduce slightly. Therefore, it is appropriate to use the City's existing Northern Service Area as a guide to determine the percent capture of new customers on the new distribution system alternatives.

Table 5-2. Elements Impacting Future Non-potable Demands		
Factors that May Decrease Recycled Water Use	Factors that May Increase Recycled Water Use	Estimated Net Effect
<ul style="list-style-type: none"> Using less water due to conservation and water efficiency Reduced water use because of current economic climate and landscaping trends to include more xeriscaping Higher recycled water cost will increase the payback period for retrofits Cost of retrofits 	<ul style="list-style-type: none"> Potable water cost will increase Recycled water cost will be less than potable 20% reduction mandate by 2020 will drive conversion from potable to recycled Recycled water is reliable (drought proof) Local, renewable water source 	<ul style="list-style-type: none"> Existing usage will stay the same or reduced slightly (higher efficiency or temporary cutbacks) Desire to connect to recycled water system will remain high (drought proof water source) Landscaping trends to include more xeriscaping not expected to be extensive enough to dramatically reduce recycled water demands

5.2.2 Results of Refined Market Assessment

A summary of the estimated demands throughout the market assessment process is shown in Table 5-3 and 5-4 for the NCWRP and new satellite plant source scenarios, respectively. The probable identified demand is shown in the farthest right column of the table (demand within 0.25 miles of proposed piping, with probability factors). Detailed breakdown of these demands (as well as demands within 0.05 miles of proposed piping) are included in Appendix I.

Figures 5-1 and 5-2 show the pipe layouts to serve the demand focus areas for the NCWRP and new satellite plant source scenarios, respectively. Refer to Appendix I for the pipe layouts including customer identification numbers (IDs) for potential customers with demands greater than 20 AFY. Note that the ID numbers pertain to potential customers listed in Appendices G and H.

The demands shown in Table 5-3 and 5-4 below include wholesale demands shown in Table 4-6 for the respective focus areas (refer to Section 4.5). Specifically, the Rancho Bernardo/I-15 Corridor focus area includes the City of Poway (northerly) demands, and the infill area includes Santa Fe Irrigation District demands.

Some demand areas could be served either by the NCWRP or new satellite plants (such as Rancho Bernardo/I-15 Corridor). Demands for a focus area vary depending on the pipe alignments from the source. It is important to note that demands served by satellite plants cannot be added to demands served by the NCWRP (they are the same demands, served by different sources of supply). Further evaluation is needed to determine the supply strategy for these areas, as discussed later in this report.

**Table 5-3. Summary of Potential Non-potable Demands by Focus Area
Supply from NCWRP**

Focus Area	Total Demand Identified in Focus Area (AFY)	Demand within 0.25 miles of proposed piping (AFY)	Demand within 0.25 miles of proposed piping, with probability factors (AFY)
Infill	5,812	5,082	2,693
Balboa Park/Central San Diego	2,564	1,989	1,132
Carmel Valley West	1,772	1,267	546
Kearny Mesa	2,643	1,227	539
Mira Mesa	884	688	294
Mission Valley/Bay	3,141	2,306	1,146
Rancho Bernardo/I-15 Corridor	5,750	4,589	2,634

**Table 5-4. Summary of Potential Non-potable Demands by Focus Area
Supply from New Satellite Plants**

Focus Area	Total Demand Identified in Focus Area (AFY)	Demand within 0.25 miles of proposed piping (AFY)	Demand within 0.25 miles of proposed piping, with probability factors (AFY)
Balboa Park/Central San Diego	2,561	1,923	1,108
Kearny Mesa	2,643	1,423	615
Mission Valley/Bay	3,141	2,258	1,130
Rancho Bernardo/I-15 Corridor	5,750	4,588	2,620

5.3 Distribution Facility Requirements for Non-potable Reuse Concepts

Potential demands from the refined market assessment (with probability factors) were used to calculate the pipe, storage, and pump station facility requirements for each demand area (under each source scenario) based on planning-level facility sizing criteria.

5.3.1 Distribution Facility Sizing Criteria

General planning-level facility requirements (for pipes, storage, and pump station) were determined for this 2010 RWMP Update. It is important to recognize that the facility sizes at this stage of the analysis should not be used for design purposes, as more detailed hydraulic modeling would be required to identify pressure zones and refine the distribution system requirements. The planning-level sizing criteria used to develop facility components of the distribution system alternatives is described in this section.

Peaking Factor

Potential peak day non-potable demands are estimated by multiplying a peaking factor of 2.0 to average day demands. The peaking factor is necessary to account for fluctuations in highly seasonal irrigation demands. Although the potential demands include cooling towers, which are more constant, the large majority of non-potable demands identified within the service area are for irrigation uses. Differentiating between irrigation and cooling tower demands along the pipelines for application of the peaking factor will not significantly change the pipe sizing results since cooling tower demands are such a small portion of total demand. Therefore, the peaking factor was applied to total demands along the system for simplicity at this planning-level stage of analysis.

Pipes

The pipes were sized based on potential peak day customer demands that were within 0.25 miles from the main pipeline distribution layouts. As water is delivered to demands, the flow in the pipe is reduced along the way. The required capacity along each segment of pipe was calculated based on the amount of remaining demands of downstream customers (i.e. pipe sizes generally decrease as distance from the source increases). Pipe sizes were calculated using the Hazen-Williams equation and the parameters shown in Table 5-5.

Storage

The total storage volume requirements for each focus area are based on 2/3 of the peak day demand, which is with a peaking factor of 2.0 applied to the average day demand. The locations of storage tanks have not been determined at this stage of analysis.

In order to determine land acquisition costs associated with storage tanks, the required area for total storage is based on 30 ft-deep tanks. Assuming a square footprint, an additional 30 ft were added to each side to allow for appurtenances and vehicle access. This area was then presented in acres as the lot size required.

Pump Stations

Pumps station requirements are based on the amount of power required to convey peak day flows to the highest elevation demand along the pipe layout from either (1) the existing distribution system (if supplied by NCWRP) or (2) a new satellite plant. The horsepower requirements for each scenario are estimated based on Equation 1 and the assumptions in Table 5-6:

$$HP = \frac{Q \times H}{3960 \times P_{eff} \times M_{eff}} \quad \text{(Equation 1)}$$

Where HP is equal to the required pump horsepower, Q is equal to the peak demand in gpm, H is the hydraulic head in ft, P_{eff} is the pump efficiency coefficient, and M_{eff} is the motor efficiency.

It should be noted that the peak demand in the equation above is a unit conversion of peak day demands to units of gpm. Peak hour factors are not incorporated at this conceptual stage of the analysis.

To determine land acquisition costs associated with pump stations, the pump stations are assumed to have a footprint of approximately 60 by 60 ft, which is a conservative size for a pump station. For this analysis, pump station footprint was assumed to be 0.25 acres to allow for appurtenances and vehicle access.

Table 5-5. Non-potable Reuse Distribution System Facility Sizing Criteria and Assumptions	
Peak Day Demand Factor:	2.0
Pipelines:	
Assumed velocity:	5 ft/s
Hazen-Williams Coefficient:	120
Storage:	
Volume Required:	2/3 peak day demand
Assume Storage Height:	30 ft
Required Lot Size/Footprint:	0.25 acres
Pumps:	
Pump Efficiency:	0.8
Motor Efficiency:	0.95
Assumed Pump Station Dimensions:	0.25 acres

5.3.2 Distribution Facility Requirements

Table 5-5 provides a summary of the focus area demands and expanded distribution facility requirements (pipelines, storage, and pump stations) under each supply scenario. As mentioned earlier, demands for a focus area vary depending on the pipe alignments from the source. Refer back to Figures 5-1 and 5-2 for pipe alignment comparisons.

Although all focus areas could potentially be served by the NCWRP, further evaluation of existing treatment and distribution system infrastructure (including in-depth hydraulic analysis) is required to determine facility improvements required to accommodate additional demands. Facilities and costs associated with improvements to existing infrastructure are not included in this analysis.

The following subsections provide a brief discussion of distribution requirements by subarea (based on information in Table 5-5).

5.3.2.1 Infill

Additional NCWRP infill customers are estimated to increase demand by approximately 2,700 AFY. It is assumed that existing storage, pump stations, and piping are sufficient to convey the additional demand. These results represent a planning-level analysis of the system. An in-depth hydraulic analysis would be required to confirm if additional facilities are needed for additional infill customers.

5.3.2.2 Rancho Bernardo/I-15 Corridor

Demands in the Rancho Bernardo/I-15 Corridor focus area could potentially be served by either the NCWRP or a new satellite plant located east of Lake Hodges. The potential demands in the Rancho Bernardo/I-15 Corridor area for both supply options are approximately 2,600 AFY. Initial review of facilities required to serve the Rancho Bernardo/I-15 Corridor area show that the satellite plant supply option will require less pipe length than delivering water from NCWRP. This is primarily because the northern pipe extension on Carmel Valley Rd. from the NCWRP system to serve the Rancho Bernardo/I-15 Corridor area would not be required if the satellite plant were constructed, unless this connection was desired for system flexibility.

5.3.2.3 Carmel Valley West

The Carmel Valley West focus area could potentially be supplied by the NCWRP, and would increase recycled water demand by 550 AFY. This area is west of the City's existing Phase II expansion along Carmel Valley.

5.3.2.4 Kearny Mesa

The Kearny Mesa focus area could potentially be served by either the NCWRP or a new satellite plant located near Qualcomm Stadium. The potential demands range from approximately 540 AFY – 620 AFY, with the higher end of the range associated with the satellite plant option. Initial review of facilities required to serve the Kearny Mesa area show that the NCWRP supply option will require less pipe length (on the order of 30,000 feet). The satellite plant option requires more pipe length primarily due to the eastern reach from the satellite plant to customers in the vicinity of I-15 and south of CA-52.

5.3.2.5 Mira Mesa

The Mira Mesa focus area could potentially be served by the NCWRP, and has a potential demand of 300 AFY that could be served with the proposed distribution system expansion.

5.3.2.6 Mission Valley/Bay

The Mission Valley/Bay focus area could potentially be served by either the NCWRP or a new satellite plant located near Qualcomm Stadium. The potential focus area demands are approximately 1,100 AFY. Provided the recycled water system is first expanded from the NCWRP to Kearny Mesa, additional facilities required to serve the Mission Valley/Bay area from the NCWRP require significantly less pipe length than the satellite plant supply option. However, if the NCWRP plant system is not expanded to the Kearny Mesa area, non-potable reuse expansion to this area would require a satellite plant.

5.3.2.7 Balboa Park/Central San Diego

The Balboa Park/Central San Diego focus area could potentially be served by the NCWRP or a new satellite plant at Balboa Park. The combined focus area demand is approximately 1,100 AFY. The supply option that would require the least amount of pipe length is the satellite plant at Balboa Park. One challenge in serving this area is that significant irrigation system improvements are anticipated to be required at Balboa Park to perform any retrofit.

Rancho Bernardo / I-15 Corridor	2,620	4.68	5.5	0.8	700	0.25	37,752 (143)	46,000	18,000	18,000	31,000	-	150,752

NOTES:

¹

Demand estimated from potential recycled water customers 0.25 miles from a proposed recycled water pipe. Takes into account probability of connection.

²

Max day demand factor of 2.0 multiplied by average day demand.

³

Storage equal to 2/3 of the peak day demand. Storage sized for demands in each subarea.

⁴

Assumed: the storage height is 30 ft, the storage area is squared and 30 ft around calculated volume footprint to allow for appurtenances, vehicle access, etc.

⁵

Calculated from equation Horsepower HP = peak demand (gpm) x hydraulic head (ft) / (3960 x pump efficiency x motor efficiency). Assumes 80% pumping efficiency and 95% motor efficiency. Values are rounded up to 50 horsepower.

⁶

Assumed the PS is approx 60 ft by 60 ft in a quarter acre lot to allow for appurtenances, vehicle access, etc.

⁷

Length of pipe (linear ft) to connect to potential non-potable customers. Assumes 0.05 mi. of 8-in pipe for each customer.

⁸

Pipe size calculated using Hazen-Williams equation. Assumes C_{HW} of 120, and water velocity of 5 fps. Rounded to nearest 1,000 ft.

⁹

At this stage of analysis, no additional piping, storage or pumping stations determined for Infill area (requires further analysis to determine facility requirements)

This page intentionally left blank.

5.4 Supply Facility Requirements for Non-potable Reuse Concepts

In order to review the need for expanded or new supply, potential demands were compared with projections of supply from existing facilities. Refer to Table 5-7, which summarizes baseline demands from existing plants (from Section 2), potential new demands (from Section 5), and projected recycled water supply from existing facilities (from Section 3). Baseline demand and potential new demands were combined to estimate total future demands, and then multiplied by a peaking day factor of 2.0 for comparison with supply facilities.

Note that projections of supply in Table 5-7 do not account for any recycled water in storage that may be available for peak day demands, which may reduce the size of wastewater flow diversions and treatment capacity needed.

Although supply from SBWRP is not considered for distribution system concepts within the City's service areas, the recycled water supply needs are included in Table 5-7 for comparison with potential Otay Water District wholesale demands. It should be noted that the City currently plans to use up the 1 mgd conveyance capacity from SBWRP for retail demands. Additional future retail demands served by SBWRP should be considered in future planning studies.

NCWRP

Table 5-7 shows that existing facilities at NCWRP would provide recycled water supply approximately equivalent to the potential demands identified for the infill area. Although the projected wastewater flows are slightly less than projected peak day demands, new demands could be pursued up to supply capacity of existing facilities or balanced with recycled water storage.

If non-potable demands were pursued in other (non-infill) areas, expanded NCWRP supply would be required (additional wastewater flow diversions, treatment capacity expansion, and/or seasonal recycled water storage). Distribution system expansion may require additional electrodialysis reversal (EDR) units at the NCWRP to meet TDS contractual requirement of 1,000 ppm or less, due to increased flow. Alternatively, some areas could be served by satellite plants.

Satellite Plants

Three satellite plants were considered that could serve potential demands in Rancho Bernardo/I-15 Corridor, Balboa Park/Central San Diego, Kearny Mesa, and Mission Valley/Mission Bay areas. These areas could be served either with new satellite plants or expanded NCWRP supply. Further evaluation is necessary to determine a supply strategy for these areas, with consideration that the Rancho Bernardo/I-15 Corridor satellite plant would not offload wastewater flows to PLWTP since flows in this area are tributary to Pump Station 77 and the Hale Avenue Resource Recovery Facility located in the City of Escondido.

SBWRP

Table 5-7 shows that SBWRP tertiary treatment capacity is approximately equivalent to potential non-potable demands for Otay Water District. The difference could likely be balanced with recycled water storage and system operations. Additional wastewater flow diversions would be required to provide supply for potential non-potable demands.

Refer to Section 3 for a discussion of expanded supply from SBWRP and potential new satellite plants.

Table 5-7. Comparison of Supply with 2035 Potential Non-potable Reuse Peak Demand

Source Category	Baseline Demand ¹ mgd	Potential Demand ² mgd	Total Future Demand mgd	Max Day Demand ³ mgd	Projected Recycled Water Supply by 2035 ⁴ mgd	Requires Additional Wastewater Diversions	Tertiary Treatment Design Capacity mgd	Requires Additional Tertiary Treatment Capacity
NCWRP (Infill Only)	9.1	2.4	11.5	23.0	24.8	No (see note 7)	30	No
NCWRP (All Subareas Served) ⁵	9.1	8.0	17.1	34.3	24.8	Yes	30	Yes
SBWRP ⁶	6.0	3	9	18.0	12.9	Yes	15	No (see note 7)
Balboa Park Satellite Plant	NA	0.9	0.9	1.8	NA	NA	2	NA
Qualcomm Stadium Satellite Plant	NA	1.6	1.6	3.1	NA	NA	3	NA
Rancho Bernardo Satellite Plant	NA	2.3	2.3	4.7	NA	NA	5	NA

Notes:

NA: Not applicable

¹ Refer to Section 2 for discussion of baseline demands;

² Potential Demand includes retail and wholesale customers;

³ Multiplies Total Future Demand with Peaking Factor of 2.0;

⁴ Refer to Section 3 for projected supply from existing facilities.

⁵ NCWRP will serve Infill, Mira Mesa, Carmel Valley West, Balboa Park/Central SD, Kearny Mesa, Mission Valley/Bay, and Rancho Bernardo/I-15 Corridor subareas;

⁶ Includes only Otay Water District recycled water demands by 2040;

⁷ Peak day demand is approximately equivalent to projected wastewater flows or treatment capacity. Demands could be pursued up to capacity or balanced with recycled water storage.

5.5 Preliminary Costs

Preliminary capital costs of the non-potable reuse concepts (supply and distribution) are summarized in Table 5-8. These capital costs were developed using the unit costs as summarized above. Refer to Appendix J for details on cost assumptions. Note that these costs represent the potential non-potable reuse concepts, and some demand areas that could be served by more than one source. The cost estimates developed for this study are intended to be planning level estimates that provide an order of magnitude opinion of cost.

Table 5-8. Summary of Preliminary Costs of All Non-potable Reuse Concepts		
Source Category	System Component	Capital Cost [\$, 2010 millions of dollars]
North City WRP	<i>Supply</i>	
	Expanded Wastewater Flow Diversions	N/A ¹
	Expanded Treatment Plant Capacity	N/A ¹
	<i>Distribution</i> ⁵	
	Balboa Park / Central San Diego	\$130.5
	Carmel Valley West	\$65.8
	Infill	\$47.6
	Kearny Mesa	\$101.8
	Mira Mesa	\$26.1
	Mission Valley / Bay	\$162.4
	Rancho Bernardo / I-15 Corridor	\$184.2
Balboa Park Satellite Plant	<i>Supply</i> ²	
	New 2-mgd MBR satellite facility	\$43.8
	<i>Distribution</i>	
	Balboa Park/Central San Diego	\$104.4
Qualcomm Stadium Satellite Plant	<i>Supply</i> ²	
	New 3-mgd MBR satellite facility	\$76.7
	<i>Distribution</i>	
	Kearny Mesa	\$110.4
	Mission Valley / Bay	\$156.5
Rancho Bernardo Satellite Plant	<i>Supply</i> ²	
	New 5-mgd conventional satellite facility	\$52.1
	<i>Distribution</i>	
	Rancho Bernardo / I-15 Corridor	\$168.8
South Bay WRP ³	<i>Supply</i>	
	Expanded Wastewater Flow Diversions (SV8)	\$158.6
	Expanded Secondary Treatment Capacity	\$357.9
	<i>Distribution</i>	
	Otay Water District	N/A ⁴

NOTES:

These are planning-level cost estimates. These conceptual estimates were developed so that an order of magnitude opinion of cost could be determined. See Appendix J for detailed estimates. Costs include markups for contingency, legal, administrative, environmental, and construction management. O&M costs are not included in this table.

¹ Not evaluated. Existing treatment capacity is sufficient for additional infill demands. However, other distribution areas would require improvements for supply expansion.

² Facility size represents nominal production capacity. All plants are scalping plants.

³ The SV8 diversion will divert approximately 30 mgd.

⁴ Existing connection to the Otay system is sufficient.

⁵ Does not include improvements required along the existing distribution system required to additional demands. Further analysis including hydraulic modeling is necessary to refine the facility requirements and costs.

5.6 Summary

This section presents the concepts for expanding the non-potable distribution system within the City's service area using supply from the NCWRP or new satellite plants, including a refined market assessment, preliminary facility requirements, and planning-level costs. In addition, SBWRP supply facility requirements and costs were evaluated for potential Otay Water District wholesale non-potable demands.

The non-potable reuse concepts are summarized as follows:

- **NCWRP supply to additional infill customers** – the estimated future infill demands (accounting for seasonal peaking), is approximately equivalent to the remaining supply available from existing NCWRP facilities
- **NCWRP supply to other (non-infill) demands areas** – would require expanded supply facilities (additional wastewater flow diversions and treatment capacity at NCWRP)
- **New satellite plants** – new plants at three locations could serve demands areas not currently served by NCWRP or SBWRP.
- **SBWRP supply to additional Otay Water District demands** – would require expanded wastewater flows diversions to SBWRP

Further analysis is required prior to implementation of any of these concepts, and next steps are outlined in Section 6.

SECTION 6 IMPLEMENTATION PLAN

This 2010 RWMP Update was developed in conjunction with the Recycled Water Study currently underway and scheduled to be complete by Fall 2011. The goal of the Recycled Water Study is to evaluate potable and non-potable alternatives to maximize recycling, and ultimately offload wastewater flows away from the PLWTP.

Based on current status of the Recycled Water Study, the recommendations are expected to focus on indirect potable reuse opportunities, with some additional non-potable reuse, to achieve the greatest PLWTP offload. In order to assess the feasibility of indirect potable reuse project, the City has initiated the Water Purification Demonstration Project, which includes a 1-mgd demonstration-scale advanced water purification facility located at the NCWRP. The feasibility of indirect potable reuse for the City will not be determined until the Water Purification Demonstration Project has been completed, which is anticipated at the end of 2012. This effort is critical in determining the region's reuse future, as illustrated on Figure 6-1.

The main focus of the 2010 RWMP Update is to assess non-potable reuse alternatives to maximize recycling if indirect potable reuse projects are not pursued in the future. The following actions are recommended prior to implementation of expanded non-potable distribution system concepts presented in Section 5:

- Completion of the Recycled Water Study currently underway, as well as City of San Diego Council action on whether the Recycled Water Study will be implemented; and,
- Completion of the Water Purification Demonstration Project to determine the feasibility of indirect potable reuse projects for the City, including modeling of the San Vicente Reservoir.

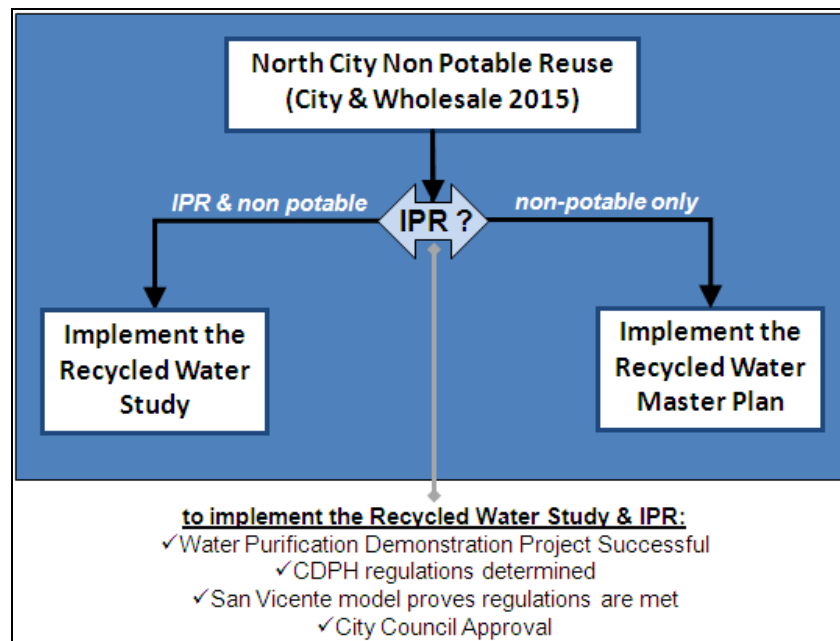

Figure 6-1. Non-potable Reuse Decision Tree.

The Water Purification Demonstration Project, San Vicente reservoir modeling, State regulations and Council approval are key steps in determining the approach taken to develop recycled water projects in the future.

If the results of the actions above indicate that indirect potable reuse projects should not be pursued, a future 2015 Master Plan would take the following steps to carry forward the analyses presented in this 2010 RWMP Update and make final recommendations:

- Screening analysis of expanded supply and distribution system concepts (presented in Sections 3 and 5, respectively), including comparison of expanded NCWRP supply versus new satellite plants; and
- Feasibility analysis of preferred non-potable reuse alternatives resulting from the screening evaluation, including further evaluation of pipe alignments and potential environmental impacts, detailed hydraulic analyses (of both the existing and proposed system) to refine facility requirements, and refinement of cost estimates.

Conclusions

It is recommended that the City move forward with the planned non-potable reuse system expansions through the 2015 planning year, which are included in the baseline system of this 2010 RWMP Update and the Recycled Water Study. Future steps should be defined in a 2015 Master Plan once the Water Purification Demonstration Project and Council direction is determined. Figure 6-2 summarizes the anticipated next steps if the City decides not to move forward with IPR, which include using the results of this 2010 RWMP Update to develop a refined non-potable reuse plan for the future.

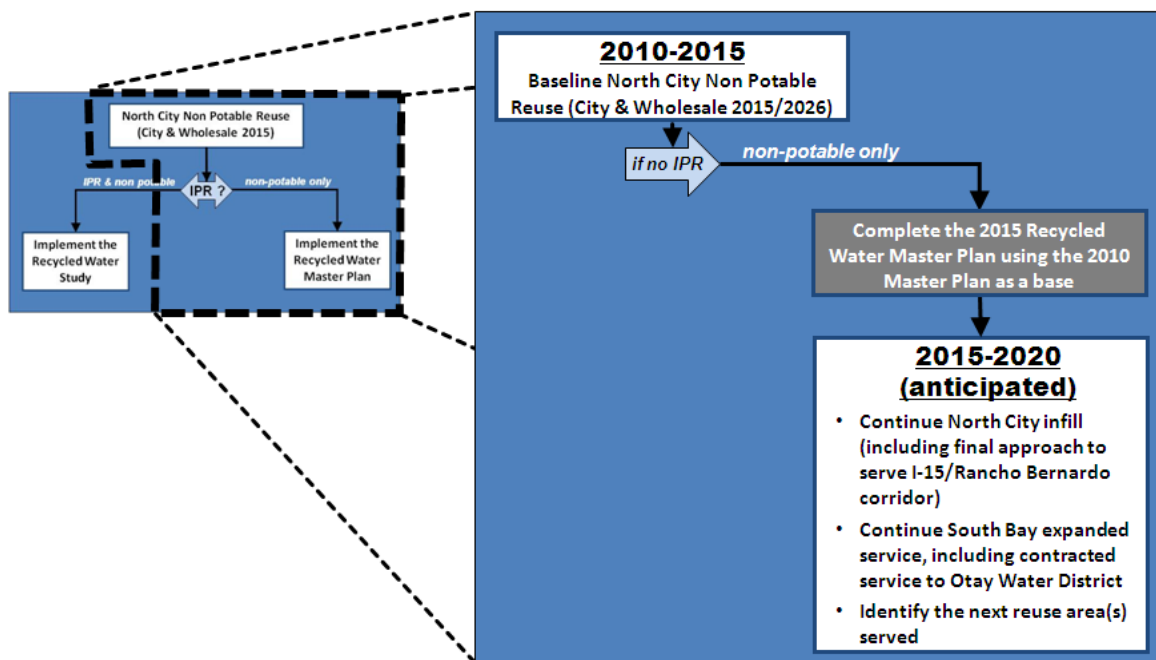

Figure 6-2. Non-potable Reuse Implementation Plan.

The non-potable implementation plan will be affected by the Water Purification Demonstration Project results and the next Recycled Water Master Plan update, scheduled in 2015. This 2010 RWMP Update will provide a technical basis to develop a refined implementation plan if the “non-potable only” route is taken.

Appendix A – PREVIOUS NON-POTABLE REUSE MARKET ASSESSMENT STUDIES

APPENDIX A PREVIOUS NON-POTABLE REUSE MARKET ASSESSMENT STUDIES

The assessment of the recycled water market has been an ongoing effort in the planning of the City's recycled water system. The following paragraphs provide a brief review of previous recycled water market assessments.

Recycled Water Distribution System Master Plan for the Northern Service Area, October 1992 – A Recycled Water Distribution Master Plan for the NSA of the City of San Diego was prepared in October 1992. This study identified potential recycled water customers north of La Jolla Village Drive and SR-52, but did not include Rancho Bernardo. One hundred thirty-eight (138) existing potential recycled water markets expected to use over 12 AFY were identified, with a total annual demand of 10,811 AFY. Future demands were estimated based on undeveloped acreage and land use designations. The total recycled water demand for this service area was estimated to be 17,916 AFY in 1992, 28,029 AFY in 2003, 29,637 AFY in 2010, and 34,314 AFY in 2050.

Recycled Water Distribution System Master Plan for the Central Service Area, October 1992 – A Recycled Water Distribution Master Plan for the CSA of the City of San Diego was prepared in October 1992. This study identified potential recycled water markets south of La Jolla Village Drive extending from the Pacific Ocean to Interstate 805 and south to the City limits boundary along La Mesa and National City. Eighty-four (84) potential recycled water markets expected to use over 50 AFY were identified, with a total annual demand of 12,040 AFY. A total of 1,477 potential recycled water customers with a possible demand of up to 20,650 AFY were identified. Of the 20,650 AFY of potential recycled water use, only 1,640 AFY was attributable to future use as this area is essentially built-out.

Update of Reclaimed Water Market Assessment for the Northern Reuse Area, November 1994 – This report provided an update to previous recycled water market assessments prepared for the City of San Diego's "Optimized Reclaimed Water Distribution System" (Optimized system) supplied by the NCWRP. The Optimized system was the first phase of a series of projects which involved construction of an extensive recycled water distribution network extending from Torrey Pines on the coast inland to the San Diego-Poway city limits. During this time, the City was undergoing a detailed water reuse strategy, the Water Repurification Project, which led to the development of the Optimized system. To accommodate this strategy, the Optimized system reduced the planned service area of the NCWRP. It was comprised of backbone pipes, ranging from 6-inches to 48-inches in diameter. In November 1994 developments within the NSA, but outside of the Optimized system's service area, were no longer required as a condition of the tentative map approval process, to install facilities for the use of recycled water.

The primary objective of the study was to confirm and update, by identification of new potential sites, the compiled list of potential users and their anticipated non-potable demands. Approximately 139 Type 1 (12 AFY or greater) and 189 Type 1A (4 to 12 AFY) users were identified through update of the market analysis. This represented an annual recycled water demand of 7,637 AFY for Type 1 users and 1,481 AFY for Type 1A users. The potential annual demand within the optimized area was determined to be 9,118 AFY. An additional future incidental demand of 885 AFY situated within the reuse service area of the Optimized system was also identified.

Update of the Reclaimed Water Market Assessment for the Southern Service Area, March 1995 – This report was prepared by Metropolitan Wastewater Department in March 1995 to update previous recycled water market assessments in the SSA. Approximately 49 large and 274 smaller existing user sites were

identified within the entire service area presenting an existing non-potable water demand of 5,520 AFY. External markets, primarily located in Chula Vista and the OWD areas presented an additional 9,550 AFY of demand. The updated present demand estimate was 2,600 AFY greater than the previous estimate presented in the *1992 Recycled Water Distribution System Master Plan for the Southern Service Area* (1992 Master Plan - SSA). The future demand updated estimate, however, was 5,800 AFY lower than presented in the 1992 Master Plan - SSA due to revised land use forecasts within both the City of San Diego and Eastern Chula Vista (Otay Ranch Development) area.

Water Reclamation Master Plan Update, December 1997 – This report was prepared for the City of San Diego with the intent to document water reclamation activities which had occurred since the preparation for the *Reclaimed Water Distribution Master Plan* reports in 1992, and identified anticipated key changes to the Master Plan over the next decade. The study summarized the findings from past studies for the NSA, SSA and CSA. The previous studies referenced in the 1997 Master Plan on the market assessment in each service area were the *1994 Update of Reclaimed Water Market Assessment for the Northern Reuse Area*, *1995 Update of the Reclaimed Water Market Assessment for the Southern Service Area* and the *1992 Reclaimed Water Distribution System Master Plan*. Reclaimed market potential within the CSA has not been updated since the 1992 Master Plan was prepared because existing user sites and associated demand, comprising nearly all of the potential non-potable market, have undergone very little change. The estimated CSA demand including the City of Coronado and the North Island is 15,000 AFY and is comprised of over 200 large and 800 smaller user sites.

South Bay Reclaimed Water Business Plan, November 1998 – The *1998 South Bay Reclaimed Water Business Plan (Business Plan)* identified a possible pipeline route from the SBWRP to both Sweetwater Authority (SWA) and Otay Water District (OWD). The study was funded by the California American Water Company, the City of San Diego MWW and Water Departments, the OWD, the San Diego CWA and the SWA. The *Business Plan* included expansion of potential recycled water use by outside agencies and possible use of recycled water for injection and subsequent extraction in the lower Sweetwater River Basin to supply the SWA's proposed demineralization plant. The *Business Plan* estimated an initial average annual demand of 3,000 AFY (2.7 MGD) to 4,000 AFY (3.6 MGD) by 2005. It also addressed a possible use of up to 3,600 AFY (3.2 MGD) of recycled water as a salt-water barrier within the groundwater basin and discussed the use of recycled water as a source of supply for recharge in the Tijuana River Valley at an initial demand of 1,000 AFY (0.9 MGD) to 3,000 AFY (2.7 MGD).

The *Business Plan* included South Bay industrial markets for recycled water, such as, Kelco (now CP Kelco and ISP Alginates), US Navy (32nd Street shipyard operations and golf course) the San Diego Marriott, Angelica Health Care Services, Duke Energy (South Bay Power Plant), Rohr Industries and NASSCO (Shipyard Operations). The South Bay Power Plant currently uses bay water for cooling. Duke Energy was also considering a new plant with an estimated recycled water demand of 3,700 AFY (5 MGD) for cooling tower use. However due to the uncertainty of the energy market and lack of a dedicated site for the new plant, it was not considered in the City's plans for recycled water use at the time.

The largest water user with a City irrigation meter was identified as the South Bay Union Emory Elementary School on Coronado Avenue that used 80 AFY (0.07 MGD) between 2001 and 2002. Within the Cal-American service area, Southwest High School in the Sweetwater Union School District is estimated to use 125 AFY (0.11 MGD). The study also identified previous recycled water markets from the *1995 Update of Reclaimed Water Market Assessment Southern Service Area* which included agricultural users in the Tijuana River Valley and additional park and school sites. These larger users included Am Sod, Egger, Yamamoto, Southwest High School, Montgomery High School and Montgomery-Waller Park. The *Business Plan* noted that these demand projections from previous assessments and market studies have been proven aggressive and should therefore be scrutinized in future evaluations.

San Pasqual Water Reclamation Program Master Plan, December 1998 – This report was prepared for the City of San Diego with the purpose of compiling all issues related to wastewater collection, treatment,

reuse and disposal relative to the Rancho Bernardo area. Feasible recycled water users were identified in four geographic areas: North of Espola Road/Rancho Bernardo Road; south of Espola Road/Rancho Bernardo Road; agricultural markets in the San Pasqual Valley and Poway. This report included wastewater flow projections for Rancho Bernardo and Poway areas tributary to the now defunct San Pasqual Water Reclamation Plant (SPWRP).

Updated Water Reclamation Master Plan (Northern and Central Service Areas), December 2000 – In December 2000, the *Updated Water Reclamation Master Plan (2000 Master Plan)* identified potential recycled water customers that could be served by the NCWRP, primarily in the NSA and CSA, that would use sufficient quantities of recycled water to warrant expansion of the recycled water system and meet the EPA reuse goals. Outside agency customers, such as, the City of Poway and OMWD were also identified as potential customers for recycled water from the City. The market assessment update anticipated a demand of 8,400 AFY that could be captured by 2003 and an increase to 12,600 AFY to 14,800 AFY (depending on the ability to use recycled water to recharge groundwater in the San Dieguito basin) in 2010. The study targeted large potential recycled water users with demands greater than 50 AFY. Smaller users were identified only if they were in close proximity to the system and cost effective.

Single meter recycled water customers beyond the Optimized System were identified in relation to the initial phases of the system expansion. Phase I was defined as the Black Mountain Ranch/OMWD corridor. The recommended markets included Black Mountain Ranch development, supplemental recycled water service to OMWD and recharge of the San Dieguito Groundwater Basin representing an additional 4,100 AFY in recycled water demand and an additional 2,260 AFY in groundwater uses.

Phase II was along the new SR-56 corridor and recommended markets included Caltrans, the existing Meadows at Del Mar Golf Course, the residential developments adjacent to SR-56 including Pacific Highlands Ranch and Torrey Highlands representing an additional demand of approximately 1,500 AFY.

Phase III was along the I-15 corridor from Carmel Mountain Road to Rancho Bernardo. Recycled water markets included Bernardo Heights Golf Course, Carmel Highlands (Mass Mutual) Gold Course, Carmel Mountain Ranch Golf Course, AETNA Life Insurance, TRW Military Electronics, Lomas Bernardo HOAs, Northern Division of the City's Park & Recreation Department and Rancho Bernardo High School. These customers represented an additional demand of approximately 1,100 AFY.

Southern San Diego Recycled Water Market Assessment Update (Southern Service Area), April 2001 – The *Southern San Diego Recycled Water Market Assessment Update* identified approximately 132 potential customers that could be served by the SBWRP, having a total annual demand of 1,900 AFY in 2001 and a projected future demand of 5,950 AFY. Major potential recycled water customers included Marshall Field, the Sweetwater Union School District and Southwest High School. Future potential recycled water customers identified included various Tijuana Valley County Water District (TJVCWD) customers for injection well purposes; Am Sod, Egger, Farmland Yamamoto and Jackson Ranch for agricultural uses; and the U.S. Navy and City of Coronado for irrigation use.

The study also updated recycled water demands from other agencies previously identified in the *1992 Recycled Water Distribution System Master Plan for the SSA*, which make up the majority of the potential recycled water demand in the South Bay. These agencies include OWD, TJVCWD and SWA. OWD was the largest potential user of the recycled water in South Bay. At the time, OWD was undergoing negotiations with the City to possibly commit to purchasing 13,440 AFY (12 MGD) of the recycled water supplied from the 15 MGD SBWRP. The TJVCWD is located between Imperial Beach and the US-Mexico border and includes the Tijuana River Valley from the coast east to the City boundary. The potential recycled water demand of 2,500 AFY (2.2 MGD) would primarily be for a proposed groundwater recharge facility. The SWA intends to use the recycled water demand primarily for groundwater injection and extraction projects for a projected demand of approximately 8,000 AFY (7 MGD) by 2010.

Draft Accelerated Implementation of Beneficial Reuse (Northern, Central and Southern Service Areas), February 2003 – Subsequent to the 2000 Master Plan was the *Draft Accelerated Implementation of Beneficial Reuse* study (2003 *Draft Accelerated Beneficial Reuse Study*) dated February 2003. The study identified opportunities above and beyond the planned 2010 system to accelerate and maximize recycled water use served by the NCWRP and SBWRP. City water meter records for irrigation meters and previous market assessments were reviewed to identify additional customers on a conceptual level.

Expanded service within the NSA included extending the distribution system to target new development in the Sorrento Mesa area, Caltrans, park districts and portions of the CSA such as the Mission Bay Golf Course and Campground, DeAnza, Playa Pacifica, Tecolote, South Shores Parklands, Sea World, Caltrans, University of San Diego, golf courses, parks, and Homeowner's Association for a total potential average annual demand of 15,700 AFY from the NCWRP. Seasonal storage of excess plant supply of up to 7,500 AFY via groundwater basins would augment peak irrigation demands in the summer.

The projected demand for the SSA was estimated to be approximately 12,300 AFY (11 MGD) by the year 2010. Large recycled water markets included OWD, International Boundary and Water Commission (IBWC), agricultural users in the Tijuana River Valley, and additional park and school sites, groundwater recharge, the SWA and Caltrans.

Beneficial Reuse - Phase 3 Recycled Water System (Rancho Bernardo/North Poway/San Pasqual), June 2003 – Concurrent with this study, the City was investigating whether it should enlarge and reactivate the SPWRP or permanently decommission the plant and provide recycled water to San Pasqual Valley and northern Rancho Bernardo from the NCWRP. The study included an alignment study to evaluate the ability to serve the Rancho Bernardo and Poway customers, and subsequently, the San Pasqual customers, via the Carmel Valley Road alignment in the North City recycled water system. Recycled water markets within these areas estimated a projected 2010 recycled water demand of 1,112 AFY (1.00 MGD) for Rancho Bernardo, 1,428 AFY (1.26 MGD) for the San Pasqual and 942 AFY (0.84 MGD) for Poway. The average annual demand totaled 3,482 AFY (3.10 MGD). Major customers included golf courses, HOAs and Caltrans. The study concluded that the Carmel Valley Road alignment was a viable alternative to the Sabre Springs alignment that was proposed in the 2000 Master Plan. The Rancho Bernardo and Poway golf courses can be served from North City without installing the Canyonside Pipeline. However, the SPSA would require this pipeline to be in place to adequately serve its customers. Additionally, substantial storage would be required to meet the estimated recycled water demands from Rancho Bernardo and San Pasqual areas.

Beneficial Reuse - Phase 3 Recycled Water Alignment and Reservoir Site Alternatives (Northern Service Area), April 2004 – Alternative Phase 3 alignments were evaluated to serve northern Rancho Bernardo and Poway golf courses. The *Phase 3 Recycled Water Alignment and Reservoir Site Alternatives Study* addressed this by comparing the 2000 Master Plan proposed Phase 3 corridor consisting of the Ted Williams Parkway and the Sabre Springs Parkway alignments to the extension of the Phase 2 Carmel Valley Road alignment based on feasibility and cost. Results of the study indicated the extension of the Carmel Valley Road alignment including construction of the 2 million gallon (MG) Pomerado Park Reservoir and an additional 2 MG of storage located south of Ted Williams Parkway was the most feasible and economical alternative to meet Phase 3 recycled water demands. The results of this analysis also refined the Phase 3 targeted customers.

City of San Diego Recycled Water Master Plan Update, September 2005 – The *City of San Diego Recycled Water Master Plan Update 2005* was the City's five-year update of their *Recycled Water Master Plan* to fulfill the requirements of San Diego Municipal Code. The study identified potential recycled water customers from the existing North Service Area and the South Bay Service Area, as well as potential new areas such as the Central and San Pasqual areas. The market assessment in this study focused on capturing infill customers near the existing North City Water Reclamation Plant (NCWRP) distribution system infrastructure. Potential

customers in this area were separated into tiers based on their water demand and proximity to the existing recycled water pipelines. Approximately 22 potable water customers were included in the Tier 1 group because their individual water demand was over 20 acre-feet per year (AFY) (0.018 million gallons per day (mgd)) and they were located adjacent to an existing or planned recycled water pipeline. Since the report was completed, City staff has actively pursued connecting the potable water use sites identified as Tier 1 customers. Eight of the nineteen sites, located adjacent to the existing recycled water distribution system, are now being served by recycled water. Several more are in the plan review stage.

For background purposes only, an overall summary of results from the 2005 market assessment are presented in Table A-1. The results include existing and projected demands from outside agencies such as Olivenhain Municipal Water District (OMWD), City of Poway, Otay Water District (OWD) and Sweetwater Authority (SWA).

Table A-1. Summary of Recycled Water Demand Estimates from the 2005 Recycled Water Master Plan Update		
Service Area Description	Average Annual Demand	
	AFY	mgd
San Pasqual Service Area	1,680	1.5
Phase III Expansion – Rancho Bernardo & North Poway	2,800	2.5
Existing North City System with Infill Demand Estimates	14,050	12.5
Existing North City System with Infill Demand Estimates and Expansion to Central Service Area	16,680	14.9
South Service Area	13,130	12.5

Note: Estimates in this table were from previous studies and are not estimates or recommendations of this 2010 RWMP Update.

South Bay Recycled Water Feasibility Study, October 2005 – This study provides an analysis with recommendations for supplying recycled water to the South Bay area, including the Southern Service Area, International Boundary and Water Commission, Otay Water District (OWD), Sweetwater Authority, CALTRANS irrigation, and the Bajagua Recycled Water Project (Mexico). The SBWRP has a treatment capacity of 15.0 mgd, and with internal plant use at 2.2 mgd, approximately 12.8 mgd can be sold to non-potable water customers. The report analyzes the existing system supply for the SBWRP, capacities, and hydraulics. It presents alternative alignments and scenarios for serving potential users, and includes project phasing and cost estimates.

The study concludes that additional recycled water capacity will be needed as the OWD system expands and the demands increase, as there is not enough recycled water capacity currently at the SBWRP to meet the peak demands of the existing and potential retail and wholesale customers OWD, SWA, Caltrans, and local markets. Otay Water District has an ultimate average annual demand of 8.23 mgd, which peaks during the summer months to 17.77 mgd, greater than the 12.8 mgd treatment capacity. Wet weather storage is needed to fully utilize the output from the SBWRP, and groundwater storage in the San Diego Formation is recommended, although further groundwater studies are required. Sweetwater Authority has expressed interest in purchasing recycled water in their Recycled Water Master Plan, with a total ultimate demand of 7.49 mgd. CALTRANS irrigation has a potential irrigation market ultimate demand of approximately 3.4 mgd. Local parks, schools, and agricultural users within the South Bay service area were identified, with a total of 634 AFY of potential demand. Another option is to sell recycled water to the Bajagua Recycled Water Project in Mexico. Because demand from Mexico is constant throughout the year, wet weather storage

is not necessary. The identified plan is for the new plant to treat approximately 59 mgd, with 25 mgd of secondary effluent coming from the International Boundary and Water Commission, and 34 mgd of local wastewater being intercepted at the border and pumped back to the plant.

City of San Diego Water Reuse Study, March 2006 - The 2006 Water Reuse Study was done in conjunction with the 2005 Master Plan Update. Several strategies for increased use of recycled water within the region were explored. The study involved input from various sources including an assembly of key stakeholders comprised of community leaders, policy makers, water consumers, business leaders and other professionals. An independent advisory panel of renowned experts in related fields was contracted through the National Water Research Institute. Public viewpoints were solicited through community meetings, focus groups and telephone/online surveys.

The study includes an evaluation of six strategies integrating non-potable reuse and indirect potable reuse opportunities for the North, Central and South Service Areas. Each of the strategies was evaluated according to a developed set of criteria which incorporates the following factors:

- | | |
|---------------------------|---------------------------|
| ■ Health and Safety | ■ Water Quality |
| ■ Social Value | ■ Operational Reliability |
| ■ Environmental Value | ■ Cost |
| ■ Local Water Reliability | ■ Ability to Implement |

The Study's findings were reviewed by the oversight stakeholder assembly group. The group unanimously recommended Option NC-3, which included infilling non-potable demands in the existing non-potable North City system, followed by an indirect potable reuse project utilizing San Vicente Reservoir. For the South Bay, SB-1 (a limited non-potable approach serving a majority of non-potable water to the Otay Water District and Sweetwater Authority) and SB-3 (an indirect potable reuse project utilizing Lower Otay Reservoir) were supported. SB-1 support was predicated on proceeding with NC-3.

City of San Diego Recycled Water Study, October 2010 - The Recycled Water Study (Study) is being conducted in conjunction with the 2010 Recycled Water Master Plan (RWMP) Update. The purpose of the Study currently underway is to identify opportunities to increase the usage of recycled water for potable and non-potable uses, the potential costs of implementing such opportunities, and to what extent such recycling could feasibly offload wastewater flows to the PLWTP. The planning horizon for this study is 2035. The Study components include a series of technical memoranda, including a non-potable reuse Market Assessment that examines the potential non-residential non-potable reuse demands within the City of San Diego and neighboring water agencies. The market assessment includes irrigation customers as well as cooling towers, car washes, laundry mats for their potential for offsetting potable water with recycled water. The market assessment described herein is based on analyses prepared for the Study.

Appendix B – POTABLE WATER CUSTOMER DATABASE RATE CODES AND PREMISE CODES

RATE CODE

Title: Rate Code

Purpose: This code indicates the rate schedule to be used for computing a consumer's bill.

Description: Description of general usage of the "Meter Type". Defines the type of billing to be done for the account. May indicate Water and Sewer, Water only, Sewer only, Backflow, etc.

Used in conjunction with Effective Dates in tables 153/bb (U02SD), 165/01 (CISTR), 170/01 (CISTS type W), 170/02 (CISTS type S, and 170/03 (CISTS type SS).

Current Code	Description	Future		
		RW	DW	DRW
11	Single family dwelling – Reg water/regular sewer	A1		
12	Single family dwelling – Reg water/flat rate sewer	A2		
13	Single family dwelling – Reg water/special rate sewer			
14	Single family dwelling – Reg water/no sewer	A4		
15	Single family dwelling – Reg water/irrigation only			
A3	Single family dwelling – Reclaimed Water/special rate sewer

54	Outside City – Reg water x 2/no sewer	E4		
55	Outside City – Reg water x 2/irrigation only	E5		
56	Outside City – Reg water/agricultural/no sewer	E6		
61	California–American – No water/reg sewer (spec billing)	F1		
64	California–American – Contract water/no sewer	F4		
F5	CalTrans – Reclaimed Water/irrigation only			
74	Fire Service – Flat rate water by connection size/no sewer	G4		
83*	Backflow – Fire service	H3		
84	Backflow – Flat rate water by backflow size/no sewer	H4		

Current Code	Description	Future		
		RW	DW	DRW
85	Backflow – No water/no sewer (private owned device)			
H5	Backflow – Reclaimed no water/no sewer (private owned device))			
94	Construction – Reg water/no sewer			
95	Construction – Reg water/no customer charge/no sewer			
J4	Construction – Reclaim Water / no sewer			
J5	Construction – Reclaim Water/no customer charge/no sewer			
97	Center island irrigation – flat rate water/no sewer	J7		

RW = Reclaimed water, DW = Drought water, DRW = Drought Reclaimed water

*New rate code – not current.

Note: activated selected Reclaimed water codes 10/97. They were

A3,A5,B3,B5,C3,C5,D3,D5,F5,H5

activated Reclaimed construction codes 10/99. They were J4, J5

PREMISE CODE

Title: Premise Code (Rev. 09/08)

Purpose: Premise code describes type of dwelling or government agency to which water and sewer service is provided.

Description:

Agency/#L.U.	Type of Premise
01-000	Single family dwelling
02-XXX	Other domestic (XXX=number of units)
03-000	Commercial
04-000	Industrial
05-XXX	Outside city
06-000	California-American Water Company
07-XXX	Motels/Hotels (XXX=number of units)
08-XXX	Trailer park (XXX=number of units)
09-XXX	Combined business and domestic (XXX=units)
10-000 Government Account	U.S. Naval Station
11-000 Government Account	Naval Air Station – North Island
12-000 Government Account	Naval Air Station – Miramar
13-000 Government Account	Naval Supply Center
14-000 Government Account	Naval Training Center
15-000 Government Account	Naval Electronics Laboratory
16-000 Government Account	Naval Hospital
17-XXX Government Account	Naval Housing (XXX=number of units)
18-000 Government Account	Navy – Fort Rosecrans
19-000 Government Account	Other Naval Facilities

Agency/#L.U.	Type of Premise
20-000 Government Account	U.S. Marine Corp.
21-000 Government Account	U.S. Coast Guard
22-000 Government Account	U.S. Post Office
23-000 Government Account	Other Federal Agencies
30-000 Government Account	Calif. Div. Of Transportation (CalTrans)
31-000 Government Account	San Diego State University
32-000 Government Account	University of Calif at San Diego (UCSD)
33-000 Government Account	Other State of California Agencies
40-000 Government Account	Pk & Rec – (for future use)
41-000 Government Account	Pk & Rec – Golf courses
42-000 Government Account	Pk & Rec – Coastal Division
43-000 Government Account	Pk & Rec – Central Division
44-000 Government Account	Pk & Rec – Community Division
45-000 Government Account	Pk & Rec – Open Sp/St Medians
46-000 Government Account	Pk & Rec – Open Space
47-000 Government Account	Pk & Rec – Open Sp/Lndscp Main
48-000 Government Account	Pk & Rec – Env Growth – Coastal
49-000 Government Account	Pk & Rec – Env Growth – Central
50-000 Government Account	Pk & Rec – Env Growth – Northern
51-000 Government Account	City of San Diego – Waste Mgt Dept
52-000 Government Account	City of San Diego – Cemeteries

Agency/#L.U.	Type of Premise
53-000 Government Account	City of San Diego – Water Util. Dept
54-000 Government Account	City of San Diego – General Svces Dept
55-000 Government Account	City of San Diego – Fire Dept
56-000 Government Account	City of San Diego – Police Dept
57-000 Government Account	City of San Diego – Library Dept
58-000 Government Account	Other City of San Diego Departments
58-000 Government Account	Other City of San Diego Departments
59-000 Government Account	City of San Diego – MWWD
60-000 Government Account	Elementary Schools
61-000 Government Account	Junior High Schools
62-000 Government Account	Senior High Schools
63-000 Government Account	Other S.D. Unified School District
70-000 Government Account	County of San Diego
71-000 Government Account	San Diego Zoo
72-000 Government Account	San Diego Unified Port District
73-000 Government Account	San Diego Transit Corporation
74-000 Government Account	San Diego Community Colleges
80-000	Irrigation Only

Appendix D – MARKET ASSESSMENT SURVEY RESULTS

Table D-1: Summary of Survey Results

Figure D-1: Location of Surveyed Customers

Completed Survey Forms:

- **Surveyed Customers with Potential Recycled Water Use**
- **Surveyed Customers with Low or No Recycled Water Use**
- **Customers Contacted but not Surveyed**

This page intentionally left blank.

APPENDIX D

MARKET ASSESSMENT SURVEY RESULTS TABLES AND QUESTIONNAIRES

Table D-1 summarizes results from the NPR Market Assessment Survey given out to high water demand retail customers. Figure D-1 shows the locations of the surveyed retail customer. Completed survey forms are also included in this Appendix. It should be noted that some customers indicated that recycled water is currently generated on-site. Additional clarification may be necessary with these customers to confirm their definition of recycled water and whether it meets requirements of Title 22, Chapter 3, Division 4 of the California Code of Regulations.

Table D-1. Market Assessment Survey Results						
Customer	Current Potable Water Demand (AFY)	Estimated New or Additional Potential Recycled Water Demand (AFY)	Current Primary Uses of Potable Water	Potential Recycled Water Uses	Water Quality Concerns with Using Recycled Water	Additional Comments
Hewlett-Packard Co	174	64 - cooling tower	Cooling tower, sewer/bathrooms	Cooling tower	Concerns with recycled water use in cooling towers	None
Marine Park Corporation (SeaWorld)	616	92 - irrigation 147 - cooling tower 184 - total	33% - sanitation; 15% - irrigation; 15% - cooling tower; 9% - rides and water elements; 11% - restaurants/food prep; 4% - filter backwash for aquatic display; 7% - washdown/maintenance; 6% cooling and thermal use.	For irrigation and cooling tower	High salt/TDS	High costs of retrofitting are a deterrent for any additional uses
San Diego Marriott Hotel & Marina	130	13 - estimated irrigation	Laundry, pools, irrigation, guest services.	Irrigation only	Tried using for laundry in past, problems with odor and discoloration. Need to confirm if recycled water complies with State Title 22 standards or is considered gray water.	Recycled water is currently generated on-site. Need to confirm if greywater.

This document was prepared solely for City of San Diego, Public Utilities Department (PUD) in accordance with professional standards at the time the services were performed and in accordance with the contract between City of San Diego, PUD and Brown and Caldwell dated July 21, 2009. This document is governed by the specific scope of work authorized by City of San Diego, PUD; it is not intended to be relied upon by any other party except for regulatory authorities contemplated by the scope of work. We have relied on information or instructions provided by City of San Diego, PUD and other parties and, unless otherwise expressly indicated, have made no independent investigation as to the validity, completeness, or accuracy of such information.

Table D-1. Market Assessment Survey Results

Customer	Current Potable Water Demand (AFY)	Estimated New or Additional Potential Recycled Water Demand (AFY)	Current Primary Uses of Potable Water	Potential Recycled Water Uses	Water Quality Concerns with Using Recycled Water	Additional Comments
Miramar Cold Storage	3	1.5 - estimated for compressors.	Compressors for refrigerators	Compressors for refrigerators	Concerns with recycled water use in compressors	None
Novartis	58	38 - cooling tower	Irrigation, cooling tower	Boiler blow down	High pH	Onsite treatment safety concerns with use of sulfuric acid to treat high pH
San Diego Unified Port District	278	139 - total irrigation through 32 meters	50% - irrigation; 25%-direct pass through to cruise/cargo ships; 11%-office potable use; 10% - multi-use; 4%-other	Irrigation. Port has more than 200 tenants; all would need to be contacted regarding usages, demands, and concerns. Port environmental staff would be willing to use for irrigation.	Irrigation run-off concerns, restrictions of use.	Strong water conservation program
University of California San Diego	2,151	232 - cooling tower only. Potentially irrigation.	Irrigation, bathrooms, 300,000 g/day - COGEN plant cooling towers	Cooling towers, additional irrigation.	None	Strong water conservation program. Waiting for additional information regarding Laboratory water treatment system. Recycled water currently used for irrigation of 25% of campus.

Use of contents on this sheet is subject to the limitations specified at the beginning of this document.

P:\Brown and Caldwell - 2124\72729 - Recycled Water Master Plan\7.0 Proj\Doc\7.5 2010 RWMP Update\Final\APPENDICES\Appendix D\Appendix D - Sample Survey Results 09162011_Rev.doc

Table D-1. Market Assessment Survey Results

Customer	Current Potable Water Demand (AFY)	Estimated New or Additional Potential Recycled Water Demand (AFY)	Current Primary Uses of Potable Water	Potential Recycled Water Uses	Water Quality Concerns with Using Recycled Water	Additional Comments
VA Hospital	304	32 - estimated cooling tower	Restrooms, cleaning, food prep., cooling tower, irrigation.	Cooling tower	Low pressure of recycled water supply, non-potable	Emergency supply stored in potable tanks requires periodic flushing. Water flushed is currently sent for use at cooling tower. Recycled water could be used but would be interrupted periodically during flushing (unless potable water was wasted). Logistical and cost concerns.
Zoological Society of San Diego	535	268	Irrigation of botanical garden, wildlife pools, restaurants, bathrooms	None	High TDS	High TDS content would harm botanical garden and wildlife. Assume 50% of potable demand could be used for irrigation if water quality issues are resolved.
Hanson Aggregates	96	0	Cement mixing, sanitation	Cement mixing, dust control, washing	Changing concentrations in recycled water (high sulfates) would hinder customer meeting specifications required for concrete. Need to confirm if recycled water complies with State Title 22 standards or is considered gray water.	Currently using recycled water generated on site for dust control and washing.

Use of contents on this sheet is subject to the limitations specified at the beginning of this document.

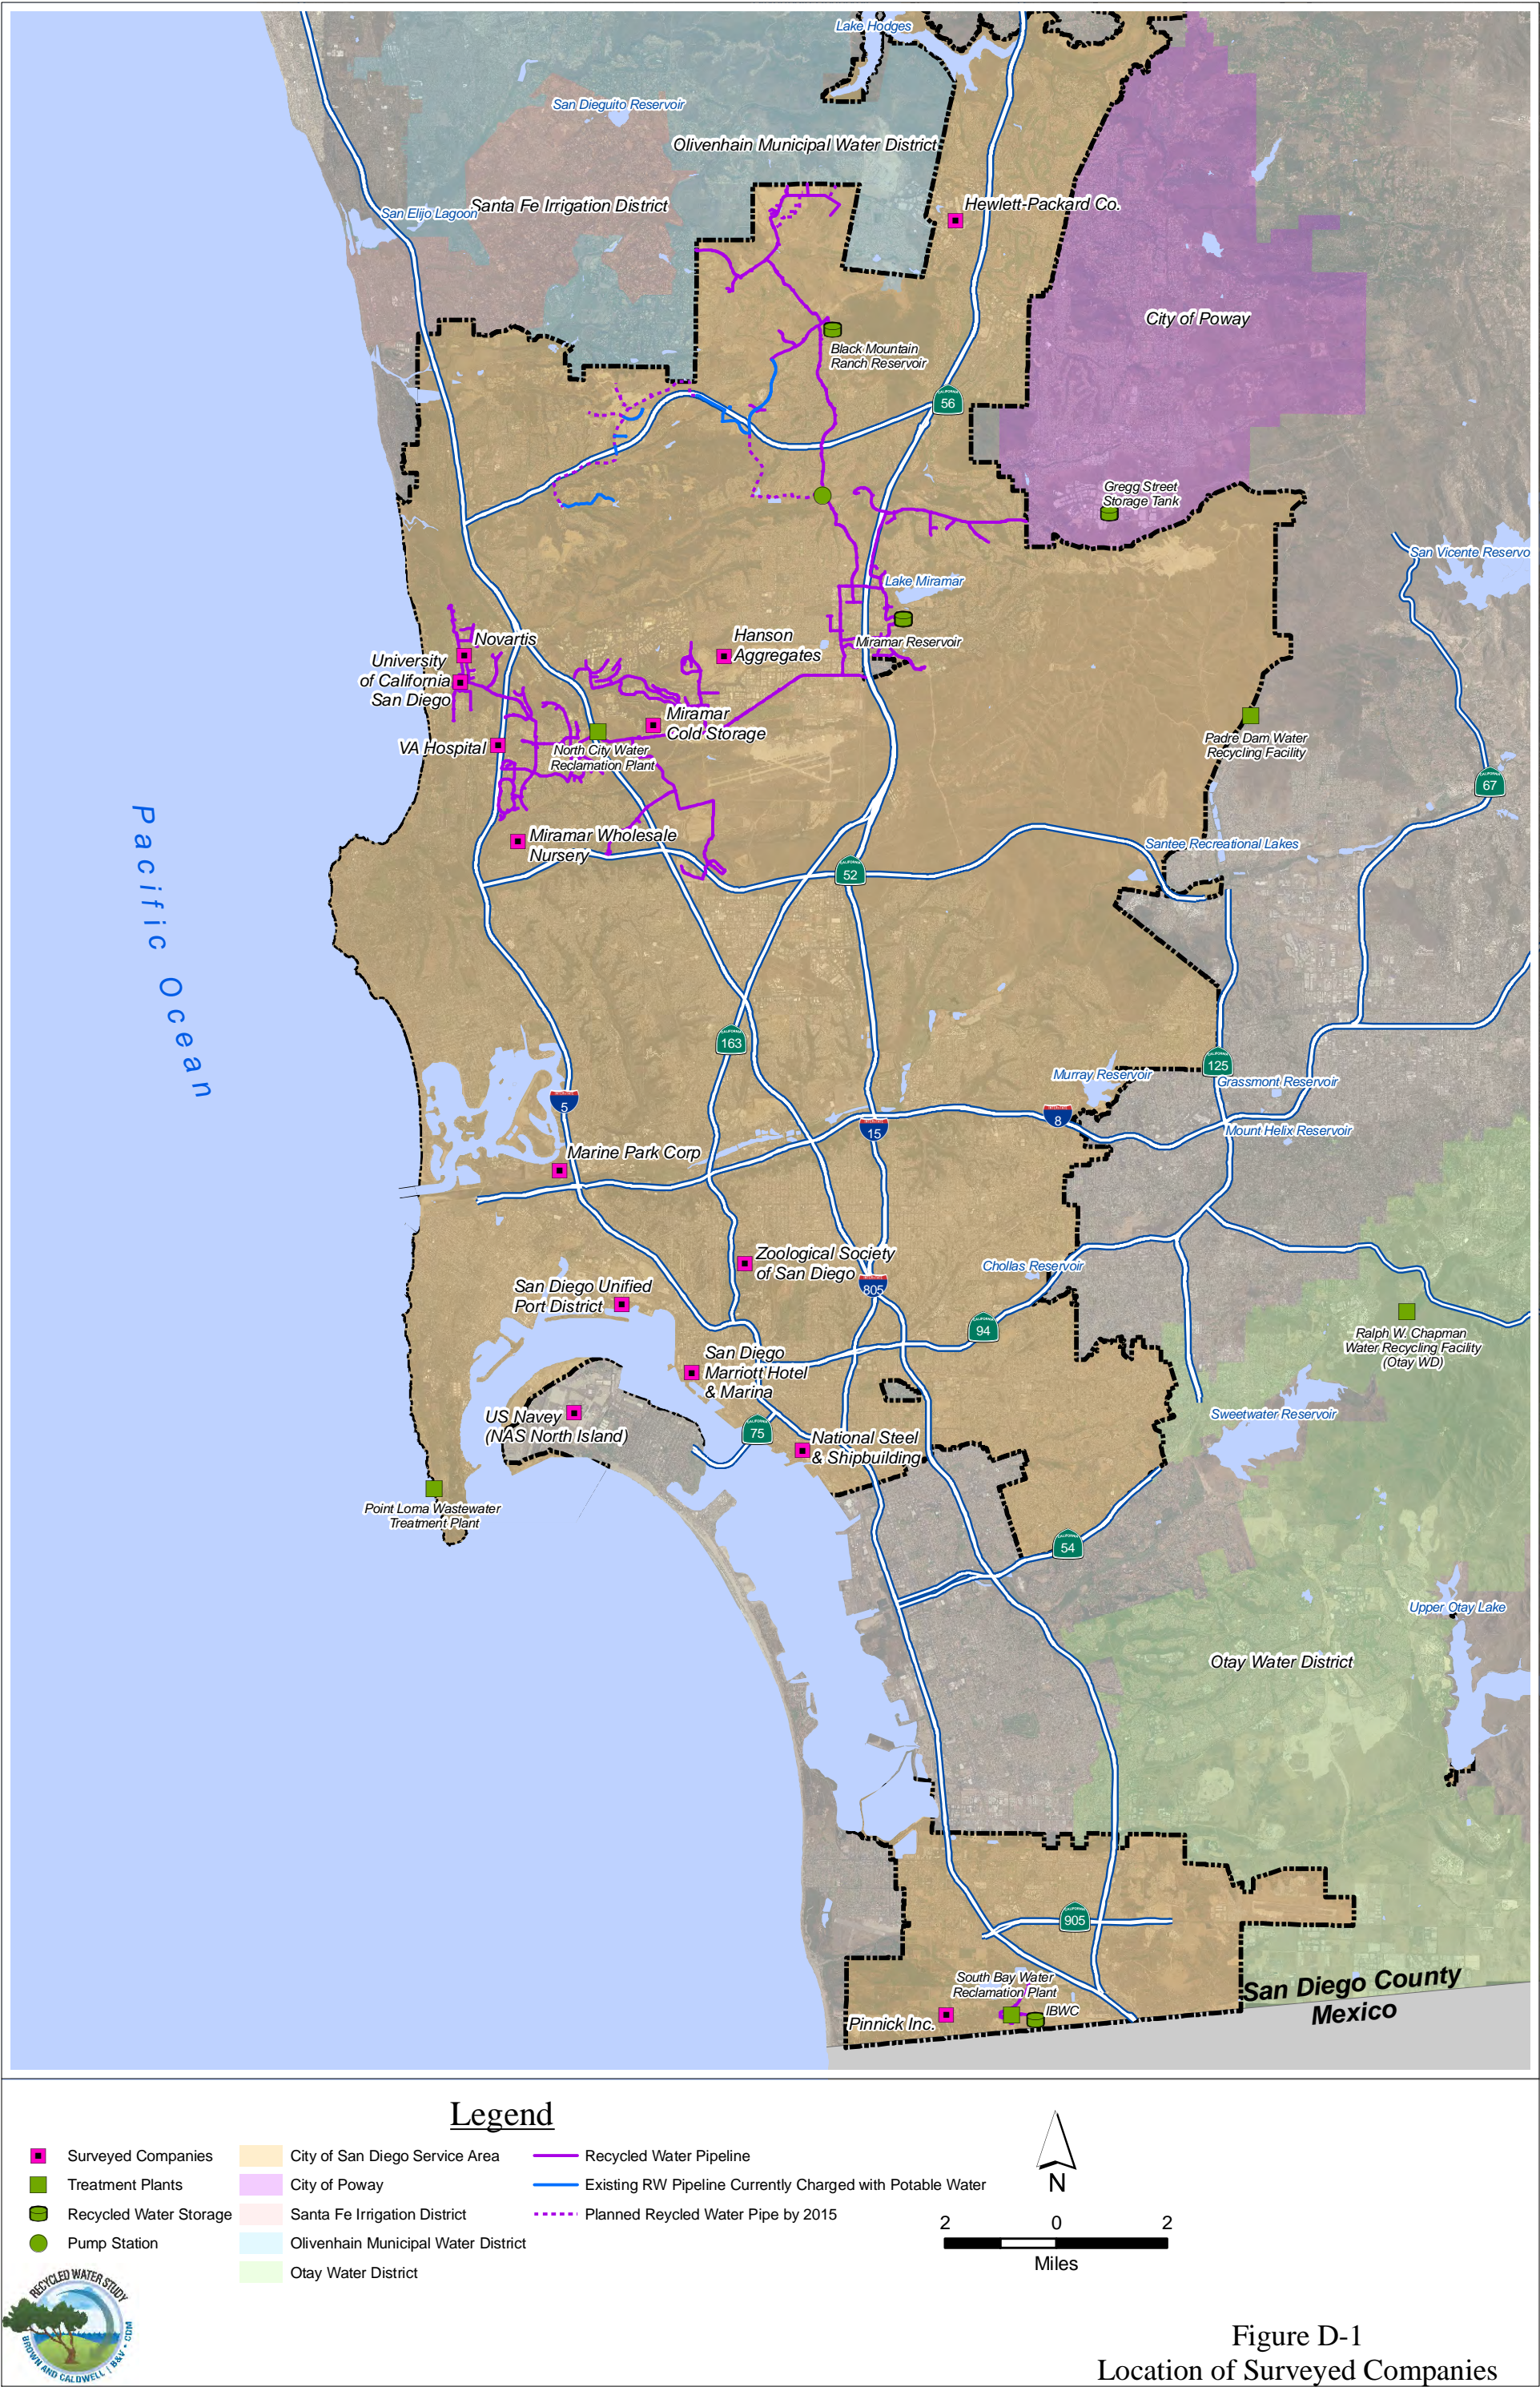

Table D-1. Market Assessment Survey Results

Customer	Current Potable Water Demand (AFY)	Estimated New or Additional Potential Recycled Water Demand (AFY)	Current Primary Uses of Potable Water	Potential Recycled Water Uses	Water Quality Concerns with Using Recycled Water	Additional Comments
Miramar Wholesale Nursery	141	0	Irrigation	Irrigation only	Fluoride and boron	Currently using recycled water 50/50 blend w/potable, higher recycled water ratio would harm plants.
National Steel & Shipbuilding	69	0	Sanitary waste	None	None	None
Pinnick Inc.	22	0	Irrigation, washing vehicles	Limited use at main office site, use would be determined by individual customer at job construction site.	"Germs and contamination", corrosion	Note that majority of water use is not at one location, but at construction sites with varying length of time for work at one location.
US Navy (NAS North Island)	Unknown - not on City of San Diego potable customer list.	Unknown. Recycled water demands could be supplied with a proposed Base Tertiary Treatment Plant, rather than with City of San Diego recycled water.	Irrigation	Irrigation, buildings	Piping to Bases not in place. Cooling towers/chillers spaced widely apart, high cost in installation of piping to each location.	NAS North Island is considering construction of on Base Tertiary Treatment Plant, potential to serve City of Coronado as well.

Use of contents on this sheet is subject to the limitations specified at the beginning of this document.

Surveyed Customers with Potential Recycled Water Use

This page intentionally left blank.

888-655-4100
655-8493
Interviewer Name: ANTHONY KNAPP
Interview Date: 10/21/2009
Company Name: Hewlett-Packard

SURVEY FORM

Before contacting customer, complete Section A to understand background information. Section B to be completed by independently by interviewer as well.

Section A. Background Information

Business Function: Electronics / Manufacturing
Business Category: Industrial
What is total potable water consumption (AFY)? 94,756,174
Do they have an "irrigation only" potable water meter? 100%
Do they have a cooling tower? Yes
What is cooling tower discharge flow (AFY)? 100 AFY
Do they already have an existing recycled connection? No
Customer ID# (potable database): 190461821080
Customer ID# (wastewater database): 119457117581

Section B. Customer Identification and Contact

Company Name: Hewlett-Packard
Company Address: 16297 West Bernardo Dr San Diego 92127
Contact Name: Mike Liminglo - Mechanical Engineer
Position in Organization: Mechanical Engineer
Contact Phone Number: 619-555-8498
Date of interview: 10/21/2009

Section C. Survey

Ask to speak with the facilities manager.

My name is _____. I work at an environmental engineering consulting firm, and am calling on behalf of the City of San Diego Long Range Planning Department. Given the uncertainty surrounding our future water supplies, the City is evaluating potential water resource alternatives for the future - one of them being increased use of recycled water for proven successful applications such as irrigation, cooling water, and other processes for example. We are conducting a market assessment survey to get a feel for the interest in using recycled water, to help the City decide whether they should expand the recycled water distribution

Interviewer Name: ANTHONY KNAPP
Interview Date: 10/21/2009
Company Name: Hewlett-Packard

system to new areas in the future. I would like to ask you some questions that relate to your particular uses of drinking water for irrigation and industrial uses. Are you the right person for me to talk to? I have about 15 questions to ask and believe our interview will take about 15-20 minutes to complete. Do you have the time to talk now, or would you like to set up a different time to talk?

Section C1. Water Use

1. According to the City's records, your organization uses approximately ____ AFY of potable water. Does that sound accurate to you?
Not sure
174 AFY 75 794 HCF
79 AFY 34,448 HCF
2. What is the majority of your water use for?
8 Buildings
Cooling Tower Use is significant
but most water use is for sand bathrooms.

IF THE ANSWER IS ONE OF THE FOLLOWING, SEE QUESTIONS BELOW. OTHERWISE, IT IS NOT AN APPLICATION THAT COULD USE RECYCLED WATER AND THERE IS NO NEED TO CONTINUE THE SURVEY QUESTIONS.

POTENTIAL APPLICATIONS FOR PURSUIT

- IRRIGATION
- CAR WASH
- CONCRETE BATCH PLANTS
- LAUNDRY FACILITIES
- COOLING TOWER
- OTHER MANUFACTURING PROCESS THAT DO NOT INVOLVE CREATION OF FOODS, BEVERAGES, OR PHARMACEUTICALS - USE FOR PACKAGING OR PREWASHING OK

Uses 21,000 gal/day
10,250 HCF/year

Interviewer Name: Anthony Knapp
Interview Date: 10/21/2009
Company Name: Hewlett-Packard

A. IF THE ANSWER IS IRRIGATION:

[USE]

- i. If they have an irrigation meter, do they use all water from it for irrigation? YES or NO. If NO, what percentage is used for irrigation?
- ii. If they don't have an irrigation meter, what percentage of your water is used for irrigation?

- iii. For any water not used for irrigation purposes, would they need a dual connection – one for potable water and one with recycled water?

B. IF THE ANSWER IS SOMETHING OTHER THAN IRRIGATION:

- i. What percentage of your total water use is for this purpose? [USE]

21,700 gal/day
11% of total use

IF THEY HAVE A COOLING TOWER, COMPLETE QUESTION 3. OTHERWISE, SKIP TO QUESTION 4.

According to the City's records, your organization has a cooling tower process, correct?

3. According to the City's records, you currently use a total of approximately 3.7 AFY of potable water, and discharge approximately 3.7 AFY from your cooling system to the sewer plant. Does this sound accurate to you?

YES ☒ NO ☐ NOT SURE ☐

35,000 gallons/day • 35,000 gallons/day → 17,000 HCF/year

35,000 HCF

Interviewer Name: Anthony Knapp
Interview Date: 10/21/2009
Company Name: Hewlett-Packard

The following questions are designed to get feedback from you that will indicate your level of agreement or interest using a scale of 1-5, with 5 being the highest.

4. Some of your water use – such as [SUMMARIZE FROM INVESTIGATIONS ABOVE – I.E. IRRIGATION AND COOLING TOWERS] – is the type that has typically been successful for conversion to recycled water. On a scale of 1 to 5, how interested is your company in converting to recycled water in the future?

1 2 3 4 5 (circle one)

[GEN]

Additional Comments?

5. Given the recent droughts and the uncertainty surrounding future imported water supplies, would you be interested in using recycled water to reduce reliance on imported water?

1 2 3 4 5 (circle one)

[ENV]

6. Would your business be affected by water use cutbacks?

1 2 3 4 5 (circle one)

[DS]

7. Would your company be interested in recycled water given it is not subject to cutbacks on use?

1 2 3 4 5 (circle one)

[DS]

Interviewer Name: Anthony Knapp
Interview Date: 10/21/2009
Company Name: Hewlett Packard

8. Do you currently have an on-site treatment system before using water?

YES ☐ NO ☒ NOT SURE

9. On a scale of 1 to 5, would you have any water quality concerns with using recycled water?

1 2 3 4 5 (circle one)

[WQ/H&S]

Additional comments on what the water quality concerns may be?

would need to check that the recycled water would be OK for use in the cooling towers.

10. If it was demonstrated to you that using recycled water would not negatively affect your business, on a scale of 1 to 5 how interested would you be in using it?

1 2 3 4 5 (circle one)

[GEN]

11. Our client/customers will approve of use of recycled water.

1 2 3 4 5

Comments: N/A

Interviewer Name: Anthony Knapp
Interview Date: 10/21/2009
Company Name: Hewlett Packard

12. Our employees will approve of our use of recycled water.

1 2 3 4 5

Comments:

13. We would be willing to retrofit our on-site system.

1 2 3 4 5

Comments:

IF THE ANSWER TO QUESTION 13 IS MORE THAN 3, SKIP QUESTION 14.

14. If recycled water rates are lower than potable rates, do you think your organization can provide the financing to retrofit your system?

1 2 3 4 5

Comments:

would need to verify that recycle water is more economical.

15. If I have follow up questions later, may I contact you? via email?

M: Ciancio

THANKS FOR YOUR TIME!

End of Survey. If they are interested in learning more about recycled water, refer them to the

City website: <http://www.sandiego.gov/water/recycled/>

Interviewer Name: Phu Shie Kasibung
Interview Date: 10/15/09
Company Name: Thrive Corp (Sawald)

SURVEY FORM

Before contacting customer, complete Section A to understand background information.
Section B to be completed by independently by interviewer as well.

Section A. Background Information

Business Function: Manufact.
Business Category: Manufact.
What is total potable water consumption (AFY)? 615,766 AFY
Do they have an "irrigation only" potable water meter? -
Do they have a cooling tower? -
What is cooling tower discharge flow (AFY)? Thermax 2.7%
Do they already have an existing recycled connection? -
Customer ID# (potable database): 1303995210712
Customer ID# (wastewater database): -

Section B. Customer Identification and Contact

Company Name: Thrive Corp (Sawald)
Company Address: 500 Sawald drive - SD 92109

system to new areas in the future. I would like to ask you some questions that relate to your particular uses of drinking water for irrigation and industrial uses. Are you the right person for me to talk to? I have about 15 questions to ask and believe our interview will take about 15-20 minutes to complete. Do you have the time to talk now, or would you like to set up a different time to talk?

Section C1. Water Use

1. According to the City's records, your organization uses approximately ____ AFY of potable water. Does that sound accurate to you?

1037 615 sounds good.
345,500 - HIF = 733 AFY

2. What is the majority of your water use for?

6.3% - Washdown
11.3% - Cooling Towers & overboard
6.3% - hot water
32.8% - Employee & sanitation (restroom & shower)
14.6% - Landscape, irrigation
11.3% - Cooling Towers & overboard
6.3% - hot water

IF THE ANSWER IS ONE OF THE FOLLOWING, SEE QUESTIONS BELOW. OTHERWISE, IT IS NOT AN APPLICATION THAT COULD USE RECYCLED WATER AND THERE IS NO NEED TO CONTINUE THE SURVEY QUESTIONS.

POTENTIAL APPLICATIONS FOR PURSUIT

-IRRIGATION
-CAR WASH
-CONCRETE BATCH PLANTS
-LAUNDRY FACILITIES
-COOLING TOWER

-OTHER MANUFACTURING PROCESS THAT DO NOT INVOLVE CREATION OF FOODS, BEVERAGES, OR PHARMACEUTICALS – USE FOR PACKAGING OR PREWASHING OK

Interviewer Name: _____

Interview Date: _____

Company Name: _____

A. IF THE ANSWER IS IRRIGATION: [USE]

- i. If they have an irrigation meter, do they use all water from it for irrigation? YES or NO. If NO, what percentage is used for irrigation?
No, comes from the potable line. 4.5% is metered internally.
- ii. If they don't have an irrigation meter, what percentage of your water is used for irrigation?

- iii. For any water not used for irrigation purposes, would they need a dual connection – one for potable water and one with recycled water?

B. IF THE ANSWER IS SOMETHING OTHER THAN IRRIGATION:

- i. What percentage of your total water use is for this purpose? [USE]

IF THEY HAVE A COOLING TOWER, COMPLETE QUESTION 3. OTHERWISE, SKIP TO QUESTION 4.

According to the City's records, your organization has a cooling tower process, correct?

3. According to the City's records, you currently use a total of approximately ____ AFY of potable water, and discharge approximately ____ AFY from your cooling system to the sewer plant. Does this sound accurate to you?

YES NO NOT SURE

*Cooling tower not shown on City records.
11.9% of water used. In cooling tower loop, losses.
2.7% cooling tower discharge.*

Interviewer Name: _____

Interview Date: _____

Company Name: _____

The following questions are designed to get feedback from you that will indicate your level of agreement or interest using a scale of 1-5, with 5 being the highest.

4. Some of your water use – such as [SUMMARIZE FROM INVESTIGATIONS ABOVE – I.E. IRRIGATION AND COOLING TOWERS] - is the type that has typically been successful for conversion to recycled water. On a scale of 1 to 5, how interested is your company in converting to recycled water in the future?

1 2 3 4 5 (circle one)

[GEN]

Additional Comments?

5. Given the recent droughts and the uncertainty surrounding future imported water supplies, would you be interested in using recycled water to reduce reliance on imported water?

1 2 3 4 5 (circle one)

[ENV]

6. Would your business be affected by water use cutbacks?

1 2 3 4 5 (circle one)

[DS]

7. Would your company be interested in recycled water given it is not subject to cutbacks on use?

1 2 3 4 5 (circle one)

[DS]

Interviewer Name: _____
Interview Date: _____
Company Name: _____

8. Do you currently have an on-site treatment system before using water?

YES ☐ NO ☒ NOT SURE

*They had 2000 water discharge.
In some cases for agriculture. But these
very small scale & only in a few cases.*

9. On a scale of 1 to 5, would you have any water quality concerns with using recycled water?

1 2 3 4 5 (circle one)

Additional comments on what the water quality concerns may be?

[WQ/H&S]

*Spill issues with large salt content
for land-scaping.*

10. If it was demonstrated to you that using recycled water would not negatively affect your business, on a scale of 1 to 5 how interested would you be in using it?

1 2 3 4 5 (circle one)

[GEN]

11. Our client/customers will approve of use of recycled water.

1 2 3 4 5

Comments:

Jan

Interviewer Name: _____
Interview Date: _____
Company Name: _____

12. Our employees will approve of our use of recycled water.

1 2 3 4 5

Comments:

13. We would be willing to retrofit our on-site system.

1 2 3 4 5

Comments:

*100+ acres. This has always been issue
phase cost impact for the park. Have to shut down
park.
Recycling has been there
main reason to hold back on
using recycled water.*

14. If recycled water rates are lower than potable rates, do you think your organization can provide the financing to retrofit your system?

1 2 3 4 5

Comments:

*Acceptable ROI, they would be willing
to adapt their system.
to using recycled water is provided*

15. If I have follow up questions later, may I contact you? via email?

SURVEY FORM

Before contacting customer, complete Section A to understand background information. Section B to be completed by independently by interviewer as well.

Section A. Background Information

Business Function: Commercial
Business Category: Hotel
What is total potable water consumption (AFY)? 78,385,500.601 = 129,388,000
Do they have an "irrigation only" potable water meter? yes
Do they have a cooling tower? NO
What is cooling tower discharge flow (AFY)? —
Do they already have an existing recycled connection?
Customer ID# (potable database): 135522801010
Customer ID# (wastewater database): 135751301010

Section B. Customer Identification and Contact

Company Name: —
Company Address: 3331 33rd Harbor Drive, SD 92101
Contact Name: Elmido Gaudin
Position in Organization: Superintendent
Contact Phone Number: 619-236-1500 / 619-236-6500 (fax)
Date of Interview: 4th msg on 10/08/09 @ 11:15 AM

Section C. Survey

Ask to speak with the facilities manager.

My name is _____. I work at an environmental engineering consulting firm, and am calling on behalf of the City of San Diego Long Range Planning Department. Given the uncertainty surrounding our future water supplies, the City is evaluating potential water resource alternatives for the future — one of them being increased use of recycled water for proven successful applications such as irrigation, cooling water, and other processes for example. We are conducting a market assessment survey to get a feel for the interest in using recycled water, to help the City decide whether they should expand the recycled water distribution

Generated on site (order from hotel quarters)
↳ 300,000-400,000

Interviewer Name: _____
Interview Date: _____
Company Name: _____

system to new areas in the future. I would like to ask you some questions that relate to your particular uses of drinking water for irrigation and industrial uses. Are you the right person for me to talk to? I have about 15 questions to ask and believe our interview will take about 15-20 minutes to complete. Do you have the time to talk now, or would you like to set up a different time to talk?

Section C1. Water Use

1. According to the City's records, your organization uses approximately _____ AFY of potable water. Does that sound accurate to you?

yes, it does sound

2. What is the majority of your water use for?

laundry, pools, irrigation, guest services

IF THE ANSWER IS ONE OF THE FOLLOWING, SEE QUESTIONS BELOW. OTHERWISE, IT IS NOT AN APPLICATION THAT COULD USE RECYCLED WATER AND THERE IS NO NEED TO CONTINUE THE SURVEY QUESTIONS.

POTENTIAL APPLICATIONS FOR PURSUIT

- IRRIGATION
- CAR WASH
- CONCRETE BATCH PLANTS
- LAUNDRY FACILITIES
- COOLING TOWER
- OTHER MANUFACTURING PROCESS THAT DO NOT INVOLVE CREATION OF FOODS, BEVERAGES, OR PHARMACEUTICALS — USE FOR PACKAGING OR PREWASHING OK

Interviewer Name: _____
Interview Date: _____
Company Name: _____

A. IF THE ANSWER IS IRRIGATION: [USE]

- i. If they have an irrigation meter, do they use all water from it for irrigation? YES or NO. If NO, what percentage is used for irrigation?

Yes they have a separate meter.

- ii. If they don't have an irrigation meter, what percentage of your water is used for irrigation?

X

- iii. For any water not used for irrigation purposes, would they need a dual connection – one for potable water and one with recycled water?

X

B. IF THE ANSWER IS SOMETHING OTHER THAN IRRIGATION:

- i. What percentage of your total water use is for this purpose?

[USE]

X

IF THEY HAVE A COOLING TOWER, COMPLETE QUESTION 3. OTHERWISE, SKIP TO QUESTION 4.

According to the City's records, your organization has a cooling tower process, correct?

3. According to the City's records, you currently use a total of approximately ____AFY of potable water, and discharge approximately ____AFY from your cooling system to the sewer plant. Does this sound accurate to you?

YES NO NOT SURE

X

Interviewer Name: _____
Interview Date: _____
Company Name: _____

The following questions are designed to get feedback from you that will indicate your level of agreement or interest using a scale of 1-5, with 5 being the highest.

4. Some of your water use – such as [SUMMARIZE FROM INVESTIGATIONS ABOVE – I.E. IRRIGATION AND COOLING TOWERS] – is the type that has typically been successful for conversion to recycled water. On a scale of 1 to 5, how interested is your company in converting to recycled water in the future?

1 2 3 4 5 (circle one)

Additional Comments?

[GEN]

5. Given the recent droughts and the uncertainty surrounding future imported water supplies, would you be interested in using recycled water to reduce reliance on imported water?

1 2 3 4 5 (circle one)

[ENV]

6. Would your business be affected by water use cutbacks?

1 2 3 4 5 (circle one)

[DS]

Trying to save water. If going to have to process (flush) installing low pressure shower heads.

7. Would your company be interested in recycled water given it is not subject to cutbacks on use?

1 2 3 4 5 (circle one)

[DS]

Recycled water sounds good. We have been using recycled water for irrigation. Interested in irrigation using recycled water.

Interviewer Name: _____
Interview Date: _____
Company Name: _____

8. Do you currently have an on-site treatment system before using water?

YES ☐ NO ☒ NOT SURE

9. On a scale of 1 to 5, would you have any water quality concerns with using recycled water?

1 2 3 4 5 (circle one)

[WQ/H&S]

Additional comments on what the water quality concerns may be?

Laundry water quality - smell & color. They were using recycled water generated on-site in the past. They water mixed in with the small & color when they used it to laundry. Do a recall they stopped using recycled water. 200,000, 200,000, 200,000.

10. If it was demonstrated to you that using recycled water would not negatively affect your business, on a scale of 1 to 5 how interested would you be in using it?

1 2 3 4 5 (circle one)

15. If I have follow up questions later, may I contact you? via email?

THANKS FOR YOUR TIME!

End of Survey. If they are interested in learning more about recycled water, refer them to the

City website: <http://www.sandiego.gov/water/recycled/>

SD Unified Port District

619-686-0254

WATER GOAL: Improve water quality in San Diego Bay. Reduce the Port's water usage to preserve San Diego's water supply.

Decrease water use in the Port Administration Building

by 10%.

• A water audit of the Administration Building was conducted to identify opportunities for water conservation.

• The Port began installing water efficient plumbing fixtures in the Administration Building to fulfill the recommendations in the audit, and expects the retrofit to be complete in April of 2009. Once this project is complete, the building's water use is expected to decrease by over 10% annually (approximately 250,000 gallons per year).

Expand the use of non-toxic, biodegradable products.

• The Port increased the procurement of environmentally friendly cleaning products by over 400%.

• New Requests For Proposals involving custodial services or products require the use of Green Seal certified cleaning products.

Lessons Learned:

• The use of reclaimed water (a.k.a. "purple pipe") for irrigation will present a challenge because the infrastructure does not currently exist to bring this water to the tiddlands. The Port is actively pursuing opportunities to expand this infrastructure.

• Graywater re-use in future Port buildings will also be challenging due to legal restrictions and permitting. However, opportunities to utilize gray-water for irrigation will be pursued as part of future development and redevelopment projects.

• The water-saving benefits of low-flow plumbing devices in Port buildings may be difficult to measure accurately. Staff is exploring options to track this information.

SUSTAINABLE BUSINESS PRACTICES GOAL: Give equal weight to environmental, economic and social concerns in the decision-making process.

Educate Port staff about the Green Port Program and how they can contribute even more to improving the environment.

• Over 500 Port staff participated in Green Port Program presentations during department staff meetings, resulting in an average 47% increase in knowledge regarding the Green Port Program.

• September was designated as Green Port Month. As part of the month's activities, 150 people attended a series of four lunch-time seminars on green topics, and 68 volunteers were recruited for Coastal Cleanup Day.

• Twenty-two Green Port tips were emailed to Port staff weekly.

• The Unified Garden Society was established to provide a means for Port employees to learn about and care for organic gardens in the planters surrounding the Administration Building.

Create a Green Port Program Web presence to get the word out about how everyone can protect San Diego's environment.

• The Green Port web presence was launched in June and has received 1,140 views with an average time of 90 seconds.

Adopt a Board Policy that expands purchasing of green products.

• An Environmentally Preferable Procurement Policy is currently under review. The Procurement Services Department plans to conduct a pilot program during 2009 to test green products and assess their performance.

Lessons Learned:

• Port staff in various departments has been proactive in incorporating green practices into daily routines. However, it has been difficult to keep track of individual actions that are taking place in different departments and buildings. Plans are underway to develop a "Model Green Department" Program, which will focus on tracking and rewarding green initiatives being practiced by individual employees and departments.

SURVEY FORM

Before contacting customer, complete Section A to understand background information.
Section B to be completed by independently by interviewer as well.

Section A. Background Information

Business Function: University
Business Category: Government
What is total potable water consumption (AFY)? 2,151 AFY (26 Acct #'s)
Do they have an "irrigation only" potable water meter? NO
Do they have a cooling tower? NO
What is cooling tower discharge flow (AFY)? NO → irrigation > 25% of campus
Do they already have an existing recycled connection? YES, on-site treatment for lab now abandoned
Customer ID# (potable database): several: 19038821010, 191311301010 (26)
Customer ID# (wastewater database): NO

Section B. Customer Identification and Contact

Company Name: University of California, San Diego
Company Address: University of California, San Diego
Contact Name: Robert Tarsberg (Superintendent - La Jolla Del Sol Apts) Compliance Officer
Position in Organization: Compliance Officer
Contact Phone Number: 858-822-7607
Date of Interview: 10/23/09

Section C. Survey

Ask to speak with the facilities manager.

My name is Valerie Fanning. I work at an environmental engineering consulting firm, and am calling on behalf of the City of San Diego Long Range Planning Department. Given the uncertainty surrounding our future water supplies, the City is evaluating potential water resource alternatives for the future - one of them being increased use of recycled water for proven successful applications such as irrigation, cooling water, and other processes for example. We are conducting a market assessment survey to get a feel for the interest in using recycled water, to help the City decide whether they should expand the recycled water distribution

* 300,000 g/day

system to new areas in the future. I would like to ask you some questions that relate to your particular uses of drinking water for irrigation and industrial uses. Are you the right person for me to talk to? I have about 15 questions to ask and believe our interview will take about 15-20 minutes to complete. Do you have the time to talk now, or would you like to set up a different time to talk?

Section C1. Water Use

1. According to the City's records, your organization uses approximately _____ AFY of potable water. Does that sound accurate to you?
2. What is the majority of your water use for?

IF THE ANSWER IS ONE OF THE FOLLOWING, SEE QUESTIONS BELOW. OTHERWISE, IT IS NOT AN APPLICATION THAT COULD USE RECYCLED WATER AND THERE IS NO NEED TO CONTINUE THE SURVEY QUESTIONS.

POTENTIAL APPLICATIONS FOR PURSUIT

- IRRIGATION
- CAR WASH
- CONCRETE BATCH PLANTS
- LAUNDRY FACILITIES
- COOLING TOWER
- OTHER MANUFACTURING PROCESS THAT DO NOT INVOLVE CREATION OF FOODS, BEVERAGES, OR PHARMACEUTICALS - USE FOR PACKAGING OR PREWASHING OK

Interviewer Name: _____
Interview Date: _____
Company Name: _____

A. IF THE ANSWER IS IRRIGATION:

[USE]

- i. If they have an irrigation meter, do they use all water from it for irrigation? **YES or NO.** If NO, what percentage is used for irrigation?
- ii. If they don't have an irrigation meter, what percentage of your water is used for irrigation?
- iii. For any water not used for irrigation purposes, would they need a dual connection – one for potable water and one with recycled water?

B. IF THE ANSWER IS SOMETHING OTHER THAN IRRIGATION:

- i. What percentage of your total water use is for this purpose?

[USE]

IF THEY HAVE A COOLING TOWER, COMPLETE QUESTION 3. OTHERWISE, SKIP TO QUESTION 4.

According to the City's records, your organization has a cooling tower process, correct?

3. According to the City's records, you currently use a total of approximately ____AFY of potable water, and discharge approximately ____AFY from your cooling system to the sewer plant. Does this sound accurate to you?

YES NO NOT SURE

Interviewer Name: Leslie Howard
Interview Date: 10/6/09
Company Name: VA Hospital

SURVEY FORM

Before contacting customer, complete Section A to understand background information. Section B to be completed by independently by interviewer as well.

Section A. Background Information

Business Function: hospital
Business Category: Government
What is total potable water consumption (AFY)? 304 AFY / 132,878 HCF
Do they have an "irrigation only" potable water meter? no
Do they have a cooling tower? yes
What is cooling tower discharge flow (AFY)? 70 AFY
Do they already have an existing recycled connection? no
Customer ID# (potable database): 190272021040 + 190272021050
Customer ID# (wastewater database): 04-0002

Section C1. Water Use

1. According to the City's records, your organization uses approximately ____ AFY of potable water. Does that sound accurate to you?

Did not discuss

2. What is the majority of your water use for?

Bill stated 'they could go on'

Bill stated "they could use some" recycled water, but "they have more concrete than grass."

IF THE ANSWER IS ONE OF THE FOLLOWING, SEE QUESTION'S BELOW. OTHERWISE, IT IS NOT AN APPLICATION THAT COULD USE RECYCLED WATER AND THERE IS NO NEED TO CONTINUE THE SURVEY QUESTIONS.

POTENTIAL APPLICATIONS FOR PURSUIT

- IRRIGATION
- CAR WASH
- CONCRETE BATCH PLANTS
- LAUNDRY FACILITIES
- COOLING TOWER - *approached internally while ago other was*
- OTHER MANUFACTURING PROCESS THAT DO NOT INVOLVE CREATION OF FOODS, BEVERAGES, OR PHARMACEUTICALS -- USE FOR PACKAGING OR PREWASHING OK

emergency water supply

use water constantly

pressure not enough for

1 mile or 2 -> recycled water plant
could use some, no accs. even

Interviewer Name: Leslie Howard
Interview Date: 10/6/09
Company Name: VA Hospital

A. IF THE ANSWER IS IRRIGATION:

[USE]

i. If they have an irrigation meter, do they use all water from it for irrigation? YES or NO. If NO, what percentage is used for irrigation?

"more concrete than grass"

ii. If they don't have an irrigation meter, what percentage of your water is used for irrigation?

no meter

iii. For any water not used for irrigation purposes, would they need a dual connection -- one for potable water and one with recycled water?

Bill was knowledgeable about dual plumbing connections and use of purple pipe

B. IF THE ANSWER IS SOMETHING OTHER THAN IRRIGATION:

[USE]

i. What percentage of your total water use is for this purpose?

cooling tower

emergency water supply

IF THEY HAVE A COOLING TOWER, COMPLETE QUESTION 3. OTHERWISE, SKIP TO QUESTION 4.

According to the City's records, your organization has a cooling tower process, correct?

3. According to the City's records, you currently use a total of approximately ____ AFY of potable water, and discharge approximately ____ AFY from your cooling system to the sewer plant. Does this sound accurate to you?

YES NO NOT SURE

did not specifically discuss #'s

Interviewer Name: Leslie Howard
Interview Date: 10/16/09
Company Name: VA Hospital

The following questions are designed to get feedback from you that will indicate your level of agreement or interest using a scale of 1-5, with 5 being the highest.

4. Some of your water use – such as [SUMMARIZE FROM INVESTIGATIONS ABOVE – I.E. IRRIGATION AND COOLING TOWERS] - is the type that has typically been successful for conversion to recycled water. On a scale of 1 to 5, how interested is your company in converting to recycled water in the future?

1 2 3 4 5 (circle one)

[GEN]

Additional Comments?

didn't mention scale, but Bill did say that recycled water use at the hospital has been discussed internally

5. Given the recent droughts and the uncertainty surrounding future imported water supplies, would you be interested in using recycled water to reduce reliance on imported water?

1 2 3 4 5 (circle one)

[ENV]

Bill said that the public needs to be educated on recycled water use and agrees that reducing imported water use is a good idea. He mentioned the Colorado River.

6. Would your business be affected by water use cutbacks?

1 2 3 4 5 (circle one)

[DS]

did not discuss

7. Would your company be interested in recycled water given it is not subject to cutbacks on use?

1 2 3 4 5 (circle one)

[DS]

yes, did not discuss scale

Interviewer Name: Leslie Howard
Interview Date: 10/16/09
Company Name: VA Hospital

8. Do you currently have an on-site treatment system before using water?

YES ☒ NO ☐ NOT SURE

9. On a scale of 1 to 5, would you have any water quality concerns with using recycled water?

1 2 3 4 5 (circle one)

[WQ/H&S]

Additional comments on what the water quality concerns may be?

did not discuss scale, but Bill is receptive to using recycled water and asked what other uses besides in a cooling tower.

10. If it was demonstrated to you that using recycled water would not negatively affect your business, on a scale of 1 to 5 how interested would you be in using it?

1 2 3 4 5 (circle one)

[GEN]

did not discuss

11. Our client/customers will approve of use of recycled water.

1 2 3 4 5

Comments:

did not discuss

Interviewer Name: Leslie Howard
Interview Date: 10/6/09
Company Name: VA Hospital

12. Our employees will approve of our use of recycled water.

1 2 3 4 5

Comments:

Bill stated recycled water use has been discussed internally. Currently no piping is nearby.

13. We would be willing to retrofit our on-site system.

1 2 3 4 5

Comments:

yes, Bill understood dual plumbing and purple pipe

IF THE ANSWER TO QUESTION 13 IS MORE THAN 3, SKIP QUESTION 14.

14. If recycled water rates are lower than potable rates, do you think your organization can provide the financing to retrofit your system?

1 2 3 4 5

Comments:

yes, Bill stated this has been discussed

15. If I have follow up questions later, may I contact you? via email?

THANKS FOR YOUR TIME!

End of Survey. If they are interested in learning more about recycled water, refer them to the

City website: <http://www.sandiego.gov/water/recycled/>

San Diego Zoo

SAN DIEGO ZOO

The San Diego Zoo and Wild Animal Park support water conservation through a variety of programs, some are visible to guests and some are behind the scenes. Both the San Diego Zoo and Wild Animal Park have used water smart landscaping techniques, using a variety of native and water-tolerant plants on their expansive grounds. The zoo has also installed 35 waterless urinals that save approximately 1 million gallons of water per year. Another 20 units are scheduled for installation.

Also, both parks have streamlined their cleaning and sewage processes to conserve water. Several ponds have been converted to a naturalized system of bio-filters and rapid-sand filters. The Wild Animal Park also operates a wastewater treatment plant onsite. Last year, the plant produced more than 22 million gallons of recycled water used for landscape irrigation. The Zoo recently installed Variable Frequency Drives on several of their filtration systems that has saved approximately 15% of overall power usage and saves approximately 45,000 gallons of water per week. Several process improvements in the Tiger River Trail area are also showing water savings of approximately 5,000 gallons per week. The new elephant project is being designed to be as water-efficient as possible. The enclosure will use high-efficiency bead filtration that will save 15,000 gallons of water per day over other means of water filtration. The new ozone generation technology at the elephant enclosure does not require water-cooling, and will result in daily water savings of 4,000 gallons. To see the water saving techniques firsthand, and of course, the animals enjoying them, visit the San Diego Zoo and Wild Animal Park.

annette larson - construction

Kevin Haupt

- botanical - not for irrigation
- salt, TSS, rape plants
• animal ~~cave~~ - not wearable. potable only
• sidewalk clean-off

great idea, but salt content too high

Company Name: _____

The following questions are designed to get feedback from you that will indicate your level of agreement or interest using a scale of 1-5, with 5 being the highest.

4. Some of your water use – such as [SUMMARIZE FROM INVESTIGATIONS ABOVE – I.E. IRRIGATION AND COOLING TOWERS] - is the type that has typically been successful for conversion to recycled water. On a scale of 1 to 5, how interested is your company in converting to recycled water in the future?

1 2 3 4 5 (circle one)

[GEN]

Additional Comments?

5. Given the recent droughts and the uncertainty surrounding future imported water supplies, would you be interested in using recycled water to reduce reliance on imported water?

1 2 3 4 5 (circle one)

[ENV]

6. Would your business be affected by water use cutbacks?

1 2 3 4 5 (circle one)

[DS]

7. Would your company be interested in recycled water given it is not subject to cutbacks on use?

1 2 3 4 5 (circle one)

[DS]

Interviewer Name: _____
Interview Date: _____
Company Name: _____

8. Do you currently have an on-site treatment system before using water?

YES NO NOT SURE

9. On a scale of 1 to 5, would you have any water quality concerns with using recycled water?

1 2 3 4 5 (circle one) [WQ/H&S]

Additional comments on what the water quality concerns may be?

Fluoride & Boron

10. If it was demonstrated to you that using recycled water would not negatively affect your business, on a scale of 1 to 5 how interested would you be in using it?

1 2 3 4 5 (circle one) [GEN]

11. Our client/customers will approve of use of recycled water.

1 2 3 4 5

Comments:

Interviewer Name: _____
Interview Date: _____
Company Name: _____

12. Our employees will approve of our use of recycled water.

1 2 3 4 5

Comments:

13. We would be willing to retrofit our on-site system.

1 2 3 4 5

Comments:

IF THE ANSWER TO QUESTION 13 IS MORE THAN 3, SKIP QUESTION 14.

14. If recycled water rates are lower than potable rates, do you think your organization can provide the financing to retrofit your system?

1 2 3 4 5

Comments:

15. If I have follow up questions later, may I contact you? via email?

THANKS FOR YOUR TIME!

End of Survey. If they are interested in learning more about recycled water, refer them to the

City website: <http://www.sandiego.gov/water/recycled/>

Interviewer Name: ANTHONY KNAPP
Interview Date: 10-7-2009
Company Name: National Steel & Ship Building

SURVEY FORM

Before contacting customer, complete Section A to understand background information.
Section B to be completed by independently by interviewer as well.

Section A. Background Information

Business Function: Manufacturing
Business Category: Industrial
What is total potable water consumption (AFY)? 69 AFY 30,000 HCF
Do they have an "irrigation only" potable water meter? Yes
Do they have a cooling tower? No
What is cooling tower discharge flow (AFY)? -
Do they already have an existing recycled connection?
Customer ID# (potable database): 921133640, 921133736, 921133828
Customer ID# (wastewater database):

Section B. Customer Identification and Contact

Company Name: National Steel and Ship Building
Company Address: 2629 East Harbor
Contact Name: Sarah Gribble 49-654-4100
Position in Organization: Facilities engineer
Contact Phone Number: 619-544-7506
Date of Interview: 10-7-2009

Section C. Survey

Ask to speak with the facilities manager.

My name is _____. I work at an environmental engineering consulting firm, and am calling on behalf of the City of San Diego Long Range Planning Department. Given the uncertainty surrounding our future water supplies, the City is evaluating potential water resource alternatives for the future – one of them being increased use of recycled water for proven successful applications such as irrigation, cooling water, and other processes for example. We are conducting a market assessment survey to get a feel for the interest in using recycled water, to help the City decide whether they should expand the recycled water distribution

Interviewer Name: ANTHONY KNAPP
Interview Date: 10-7-2009
Company Name: National Steel & Ship Building

system to new areas in the future. I would like to ask you some questions that relate to your particular uses of drinking water for irrigation and industrial uses. Are you the right person for me to talk to? I have about 15 questions to ask and believe our interview will take about 15-20 minutes to complete. Do you have the time to talk now, or would you like to set up a different time to talk?

Section C1. Water Use

1. According to the City's records, your organization uses approximately 69 30,000 HCF AFY of potable water. Does that sound accurate to you?

Yes.

2. What is the majority of your water use for?

Sanitary waste. No cooling towers at process flows. Very little irrigation flows.

IF THE ANSWER IS ONE OF THE FOLLOWING, SEE QUESTIONS BELOW. OTHERWISE, IT IS NOT AN APPLICATION THAT COULD USE RECYCLED WATER AND THERE IS NO NEED TO CONTINUE THE SURVEY QUESTIONS.

POTENTIAL APPLICATIONS FOR PURSUIT

-IRRIGATION
-CAR WASH
-CONCRETE BATCH PLANTS
-LAUNDRY FACILITIES
-COOLING TOWER

No people water needs.

-OTHER MANUFACTURING PROCESS THAT DO NOT INVOLVE CREATION OF FOODS, BEVERAGES, OR PHARMACEUTICALS – USE FOR PACKAGING OR PREWASHING OK

Interviewer Name: _____
Interview Date: _____
Company Name: _____

A. IF THE ANSWER IS IRRIGATION:

[USE]

- i. If they have an irrigation meter, do they use all water from it for irrigation? YES or NO. If NO, what percentage is used for irrigation?
- ii. If they don't have an irrigation meter, what percentage of your water is used for irrigation?
- iii. For any water not used for irrigation purposes, would they need a dual connection – one for potable water and one with recycled water?

B. IF THE ANSWER IS SOMETHING OTHER THAN IRRIGATION:

[USE]

- i. What percentage of your total water use is for this purpose?

IF THEY HAVE A COOLING TOWER, COMPLETE QUESTION 3. OTHERWISE, SKIP TO QUESTION 4.

According to the City's records, your organization has a cooling tower process, correct?

3. According to the City's records, you currently use a total of approximately ____AFY of potable water, and discharge approximately ____AFY from your cooling system to the sewer plant. Does this sound accurate to you?

YES NO NOT SURE

Interviewer Name: _____
Interview Date: _____
Company Name: _____

The following questions are designed to get feedback from you that will indicate your level of agreement or interest using a scale of 1-5, with 5 being the highest.

United States Marine Corps
Marine Corps Air Station
Miramar
San Diego, California
858-577-7734

In fiscal year (FY) 2007, Marine Corps Air Station Miramar achieved total water cost savings of more than \$1 million. Miramar used metering equipment to locate and repair water leaks throughout the base and identify and to troubleshoot high water use areas. This effort decreased potable water consumption by 29 million gallons. In addition, to help relieve drought conditions affecting the San Diego region, the station completed the first two phases of a reclaimed water project. Irrigation of the station's golf course was converted from potable to reclaimed water by tapping into the City of San Diego's large reclaimed water line, saving another 97 million gallons for a total of 126 million gallons saved at the station. These savings equate to a decrease in water consumption of 15% from the previous year, reducing the station's consumption to 12% below the FY 2003 baseline. Five remaining phases of the reclaimed water project are planned for completion by FY 2010.

Appendix E – WATER PURVEYER SURVEY SAMPLE

This Page Intentionally Left Blank

August 26, 2009

Mr./Ms. Name

Name of Participating Agency or Water Purveyor

Address

City, CA 9XXX

Subject: City of San Diego Recycled Water Study
Request for Recycled Water Program Information for Use in Long-Range
Planning

Dear Mr./Ms. Name:

Recently, the City of San Diego embarked on an 18-month Recycled Water Study to identify opportunities to increase recycling and reclamation of wastewater within the City of San Diego and the Participating Agencies of the Metro Joint Powers Authority (Metro JPA). The overarching goal of the study is to determine to what extent water recycling and reclamation could feasibly offload wastewater flows to the Point Loma Wastewater Treatment Plant (PLWTP) and allow PLWTP to be upgraded to full secondary treatment at the lowest total cost. The focus of this component of the study is to evaluate ways to maximize the recycling program within the service areas of the City and of the Metro Participating Agencies (PAs).

We respectfully request the assistance of your agency in our efforts to estimate the potential demand for recycled water within the City's and the PAs' service areas. We understand that although Water Purveyors' and PAs' service areas may overlap, they do not always coincide exactly. Thus, we are asking each Participating Agency and Water Purveyor to provide information about their current and future plans for serving recycled water within their jurisdiction. The City would like to obtain any planning document that has been done or is currently underway that may be relevant to this study. The attached questionnaire will help to characterize the water recycling program within your service area as it currently exists and what may be planned to be implemented within the planning horizon ending 2035. This data will be used to identify the optimum facility and service plan for recycled water for the San Diego Region. Please complete the questionnaire and return it to me by e-mail, fax, or mail by September 10, 2009.

Please contact me at 619-533-4186 or ABarhoumi@sandiego.gov if you have any questions. We appreciate your help in planning for recycled water use in the San Diego region.

Very truly yours,

Amer Barhoumi, PE
Project Manager
600 "B" Street

RE: Recycled Water Study

Dear Amer:

As always, we look forward to working with the City of San Diego (City) on a variety of projects that benefit our agencies and the region. Helix Water District (District) provides water service to the cities of La Mesa, El Cajon, Lemon Grove, and unincorporated areas of the County of San Diego. The District does not currently have any recycled water facilities or customers. However, we are planning the El Monte Valley Groundwater Recharge, Mining, and Reclamation Project using highly treated purified recycled water to provide up to 5,000 acre-feet per year to offset potable water use. We have coordinated this project with Padre Dam Municipal Water District and the City for potential highly treated purified recycled water sources. Please see the attached completed questionnaire, map, and a copy of our most recent Recycled Water Report in 1991.

Should you or your staff have any questions regarding the information provided, please do not hesitate to contact me at (619) 667-6241 or Tim Smith at (619) 667-6201.

Sincerely,

Carlos V. Lugo
Director of Engineering/Chief Engineer

City of San Diego Recycled Water Study
Request for Recycled Water Plan Information from Water Purveyors within Participating Agencies' Jurisdictions

Question	Response
Water Purveyor name and contact information Name Address Phone Email address	Helix Water District 7811 University Avenue, La Mesa, CA 91942 (619) 466-0580 helix@helixwater.org
Description of Service Area (map if available)	Helix Water District's existing service areas include the cities of La Mesa, El Cajon, Lemon Grove, and unincorporated areas of the County of San Diego.
Status of Recycled Water Planning (i.e., plan developed, plan not developed, etc.; indicate availability of documents and provide available reports)	A Recycled Water Report was prepared in 1991 (Dudek). An El Monte Valley Groundwater Recharge Project feasibility study was prepared in 2006.
Anticipated Recycled Water Use in Jurisdiction	Current Future (2035)
Average Use (acre-ft/yr or indicate other units). Please indicate current source of recycled water.	0 AF/yr 5,000 AF/yr
Peak Use (acre-ft/yr or indicate other units)	0 AF/yr 5,000 AF/yr
Number and Type of Customers	None All Helix Water District retail and wholesale customers
Do you have any recycled water quality concerns or requirements?	The recycled water currently planned as part of the El Monte Valley Groundwater Recharge Project would be highly treated purified recycled water (microfiltration, reverse osmosis, ultraviolet light) for use in Indirect Potable Reuse (IPR). The quality of the IPR water must meet CDPH and RWQCB requirements for IPR and groundwater recharge.

Identify preferred location and diameter of point of connection from the City of San Diego Boundary for wholesale recycled water delivery	The preferred location for delivery of highly treated purified recycled water for the El Monte Valley Groundwater Recharge Project is at the intersection of Moreno Avenue and Willow Road along the City of San Diego's proposed Reservoir Augmentation Pipeline from the North City WRF to San Vicente.
Do recycled water distribution facilities exist within your jurisdiction? If so, please provide a map if available.	No
<p>Certainty Assessment of Recycled Water Projections – If recycled water were available to you as a wholesale commodity, what is your confidence that a RW system could be implemented within your jurisdiction?</p> <p>What are the key issues affecting RW program implementation?</p> <p>Is your PA/Water Purveyor willing to provide financial support for customer retrofits?</p> <p>Is a mandatory water reuse ordinance in place or planned for your jurisdiction?</p> <p>Please provide a copy of the recycled water portion of the current Urban Water Management Plan for your agency.</p>	<p>Implementation would be highly treated purified recycled water for the El Monte Valley Groundwater Recharge Project. High Confidence.</p> <p>Recycled water would need to be highly treated purified recycled water suitable for IPR. Other key issues affecting implementation of the El Monte Groundwater Recharge Project include regulatory approval, funding, and outstanding litigation.</p> <p>N/A – Not required for IPR</p> <p>N/A – Not required for IPR</p> <p>Not Applicable</p>

<p>Do you have any additional comments?</p>	<p>Helix is supportive of the City's effort to move forward with their IPR/reservoir augmentation project. It is our understanding that advanced treated recycled water from the North City Water Reclamation plant will be pumped to San Vicente Reservoir via the proposed Reservoir Augmentation Pipeline. Helix would like the City to keep in their planning the option of delivering a portion of this water to Helix in off the Reservoir Augmentation Pipeline at Moreno Avenue/Willow Road. Helix could use this water for groundwater recharge and extraction as part of the El Monte Valley Groundwater Recharge Project (conjunctive use, put-and-take). The groundwater would be blended with our surface water supplies and treated at our R. M. Levy Water Treatment plant to supplement our potable water supply.</p> <p>Otherwise, we do not have nor plan to add Title 22 recycled water distribution into our service area.</p>
<p>Please provide any document that you believe may impact this study.</p>	<p>Attached Recycled Water Report (1991). The City of San Diego has copies of all documents related to the El Monte Valley Groundwater Recharge Project (contact Marsi Steirer).</p>

Otay Water District
(Existing Wholesale Customer)

City of San Diego Recycled Water Study
Request for Recycled Water Plan Information from Water Purveyors within Participating Agencies' Jurisdictions
December 17, 2009

Question	Response
<p>Water Purveyor name and contact information</p> <p>Name Address Phone Email address</p>	<p>Otay Water District 2554 Sweetwater Springs Boulevard Spring Valley, CA 91978-2004 (619) 670-2242 jpeasley@otaywater.gov</p>
<p>Description of Service Area (map if available)</p>	<p>The Otay Water District (WD) recycled water service area is the eastern portion of the City of Chula Vista located generally east of I-805 and the Otay Mesa within the Otay WD jurisdiction. Maps are provided in the attachment which is from the final draft of the most current Water Resources Master Plan (WRMP) Chapter 5 – Recycled Water System.</p>
<p>Status of Recycled Water Planning (i.e., plan developed, plan not developed, etc.; indicate availability of documents and provide available reports)</p>	<p>Recycled water is currently being conveyed to customers and it is used entirely for landscape irrigation purposes. Attached is the final draft of the most current WRMP Chapter 5 – Recycled Water System.</p>
Anticipated Recycled Water Use in Jurisdiction	Future (2035)
<p>Average Use (acre-ft/yr or indicate other units). Please indicate current source of recycled water.</p>	<p>The Otay WD was supplied with 3,658 acre feet of recycled water in FY 2009 from the South Bay Water Reclamation Plant (SBWRP). The Otay WD Ralph W. Chapman Water Recycling Facility (RWCWRF) produced 843 acre feet of recycled water in FY 2009. The Otay WD total recycled water demand for FY 2009 was 4,501 acre feet and it was used entirely for landscape irrigation.</p> <p>Current recycled water supply sources are the RWCWRF with a maximum capacity at 1.2 million gallons per day (mgd) and the SBWRP at 6.0 mgd with the SBWRP supply ending 2027.</p> <p>The current rated capacity of the RWCWRF is 1.3 million gallons per day (mgd) with an effective recycled water production capacity of about 1.2 mgd or about 1,300 acre feet per year. There are currently no plans or intent to expand the capacity of the RWCWRF prior to 2020.</p> <p>The current rated capacity of the SBWRP is 15 mgd with an effective recycled water production capacity of about 14 mgd or about 15,700 acre feet per year. There are currently no plans or intent to expand the capacity of the SBWRP prior to 2020.</p> <p>The projected recycled water irrigation demand for the Otay WD in the year 2035 is 10,000 acre feet per year. This excludes potential industrial and commercial uses and power plant cooling uses. If it assumed that about 1,000 acre feet per year will be supplied by the Otay WD RWCWRF, thus the take from the SBWRP will be at least 9,000 acre feet per year for irrigation uses only. These take numbers assume the peak summer irrigation demands can be met from the SBWRP supply source.</p>

Question	Response
<p>Certainty Assessment of Recycled Water Projections – If recycled water were available to you as a wholesale commodity, what is your confidence that a RW system could be implemented within your jurisdiction?</p> <p>What are the key issues affecting RW program implementation?</p> <p>Is your PA/Water Purveyor willing to provide financial support for customer retrofits?</p> <p>Is a mandatory water reuse ordinance in place or planned for your jurisdiction?</p>	<p>The Otay WD is 100 % confident that recycled water retail operations will continue and be expanded as along as the City of San Diego wholesale recycled water supply rate remains fair, reasonable, founded upon accurate engineering and accounting information and sound principles, and in conformance with applicable laws.</p> <p>The key issues affecting recycled water implementation and continued retail agency recycled water system operations are the City of San Diego wholesale recycled water supply purchase price and the City of San Diego relationship and fair treatment of its wholesale recycled water customer base. The City of San Diego recycled water supply wholesale rates must be substantially lower than and different from their retail rates. Given the physical and other differences, including the complete independence from one another, the cost allocations related to the North City System and the South Bay System including their treatment plants must be separately accounted for and priced to arrive at a separate wholesale rate and a retail rate for each system. The South Bay System must not be included in any way, including costs, within the North City System. The Otay WD is a retail recycled water purveyor and the City of San Diego supplies SBWRP recycled water to Otay WD at a wholesale rate of \$350 per acre foot. The primary reason, among others, that the \$350 rate is a wholesale rate to Otay WD is that the Otay WD paid 100% of the cost to construct the facilities from the SBWRP to the Otay WD existing recycled water system for conveyance of the SBWRP supply. In addition the Otay WD paid a fee to the City in the amount of \$3.6 million dollars for the SBWRP supply. The Otay WD has spent over \$130 million on recycled water infrastructure. Realization of the Otay WD supply takes from the SBWRP hinges upon fair and reasonable wholesale recycled water pricing by the City.</p> <p>The Otay WD does support retrofit financial assistance to a limited extent.</p> <p>The Otay WD mandatory recycled water use ordinance is in place.</p>
<p>Please provide a copy of the recycled water portion of the current Urban Water Management Plan for your agency.</p>	<p>See attached Otay WD UWMP for 2005. The recycled water data in the 2005 UWMP is based on the 2002 Otay WD Water Resources Master Plan.</p>
<p>Do you have any additional comments?</p>	<p>The Otay WD would like the City of San Diego to expand the capacity of the SBWRP or at a nearby location and increase the supply of appropriate levels of TDS waste water collection to the SBWRP location to be capable of producing and supplying at least 24 mgd recycled water to Otay WD.</p> <p>The City of Chula Vista and Otay WD are currently and cooperatively evaluating the feasibility of constructing a 6 mgd reclamation facility in the South Bay from which the Otay WD is interested in acquiring a recycled water supply of 6 mgd. The existing system of pumping, piping, and storage will be used for conveyance of the City of Chula Vista supply.</p> <p>If the City of San Diego does not continue in the future to be successful in acquiring the Point Loma Plant waiver than waste water agencies (i.e. Participating Agencies) such as Otay WD will be seriously looking for a level of waste water disposal independence from the Metro System. Metro System independence will likely be less costly than the costs for going to secondary treatment at the Point Loma site.</p>
<p>Please provide any document that you believe may impact this study.</p>	<p>The SBWRP is currently operated well below its rated capacity of 15 mgd primarily due to waste water supply limitations. Operating the SBWRP in that manner (i.e. well under current capacity) the City of San Diego will not be capable of supplying sufficient quantities of recycled water to the Otay WD in the near future to meet demands of the Otay WD. Under this situation the City will lose an additional revenue opportunity. Other direct local and regional benefits will be lost as well such as lessening the waste water load on the Point Loma Plant.</p> <p>The City of San Diego should carefully review the existing City of San Diego recycled water studies.</p>

Padre Dam Municipal Water District

City of San Diego Recycled Water Study
Request for Recycled Water Plan Information from Water Purveyors within Participating Agencies' Jurisdictions

Question	Response
<p>Water Purveyor name and contact information</p> <p>Name Address Phone Email address</p>	<p>Padre Dam Municipal Water District Attention: Arne Sandvik, P.E. Senior Engineer P.O. Box 719003 Santee, California 92072 619-258-4643 asandvik@padre.org</p>
<p>Description of Service Area (map if available)</p>	<p>Padre Dam MWD serves potable water to both its Western and Eastern Service Area. Padre Dam purchases all of its water as potable water from the County Water Authority. Sewer collection and treatment is provided by the District for the Western Service Area only. Raw wastewater sewer flows generated in the Western Service area is currently 6.2 mgd and at build-out projected to be 7.5 mgd. The Padre Dam Water Recycling Facility (WRF) currently treats 2.0 mgd of the sewage flow, the remaining flow is sent to the Metro System for treatment at the Point Loma Wastewater Treatment Plant. Recycled water is only served currently in the Western Service Area. A location map is attached showing District Boundaries.</p> <p>Padre Dam is currently in the planning process to identify new users within its service area and to determine financial feasibility to expand its existing 2.0 mgd plant to 4.0 mgd (Phase 1) to serve the increase in demand within its service area.</p> <p>Padre Dam (WRF) is also coordinating with Helix Water District to potentially serve Advanced Treated Water for the El Monte Valley Aquifer Recharge Project. If the El Monte Recharge Project is fully developed as currently planned, an additional 4.5 mgd of demand would be realized. A future expansion (Phase 2) of the Padre Dam WRF to 10 mgd would be required to supply water to supply for this project.</p> <p>Studies are currently in process and should be finalized in early 2010.</p>

Question	Response
Anticipated Recycled Water Use in Jurisdiction	Future (2035)
Average Use (acre-ft/yr or indicate other units). Please indicate current source of recycled water.	<p>0.8 mgd - Distribution (1) <u>0.5 mgd</u> – Santee Lakes 1.3 mgd Total Yearly Demand</p> <p>Current source of recycled water is from the 2.0 mgd Padre Dam Water Recycling Facility.</p> <p>Note: (1) Includes 0.17 mgd for Sycamore Landfill located outside the District Boundary.</p> <p>3.3 mgd – Distribution (2) <u>0.5 mgd</u> – Santee Lakes 3.8 mgd – Total Yearly Demand</p> <p>Proposed source of water from a future expansion to the Padre Dam water Recycling Facility (from 2 to 4 mgd).</p> <p>Note: (2) Includes 0.29 mgd for Sycamore Landfill and 0.07 mgd for Castle Rock Development located outside the District Boundary. The El Monte Valley Recharge Project would add an additional 4.5 mgd.</p>
Peak Use (acre-ft/yr or indicate other units)	<p>The peak month demand is 1.5 times the average yearly demand.</p> <p>The peak month demand is 1.5 times the average yearly demand.</p>
Number and Type of Customers	<p>200 existing customers; developments, schools, parks, etc.</p> <p>40 potential new customers; developments, schools, parks, golf courses, etc.</p>
Do you have any recycled water quality concerns or requirements?	<p>Basic Title 22 water quality for all irrigation and Santee Lakes demands.</p> <p>Advanced Water Treatment would be necessary to serve a future El Monte Valley Recharge Project.</p>
Identify preferred location and diameter of point of connection from the City of San Diego Boundary for wholesale recycled water delivery	<p>All present and future demands are planned to be served by the Padre Dam Water Recycling Facility.</p>

Question	Response
<p>Do recycled water distribution facilities exist within your jurisdiction? If so, please provide a map if available.</p>	<p>A map of our current system is attached.</p>
<p>Certainty Assessment of Recycled Water Projections – If recycled water were available to you as a wholesale commodity, what is your confidence that a RW system could be implemented within your jurisdiction?</p> <p>What are the key issues effecting RW program implementation?</p> <p>Is your PA/Water Purveyor willing to provide financial support for customer retrofits?</p> <p>Is a mandatory water reuse ordinance in place or planned for your jurisdiction?</p>	<p>Padre Dam is currently studying the economics of expanding their existing Water Recycling Facility to meet future demands, including the cost of the distribution system to serve these demands.</p> <p>The key issue is financial viability.</p> <p>Padre Dam has identified potential retrofit sites and will seek financial assistance from the County Water Authority through their Retrofit Program.</p> <p>The District Rules and Regulations require recycled water to be used in areas where it is available. The District currently waives facility development fees for recycled water service. The District is also considering a future reduction in water rates during the winter months for large recycled water users.</p>
<p>Please provide a copy of the recycled water portion of the current Urban Water Management Plan for your agency.</p>	<p>A copy is attached.</p>
<p>Do you have any additional comments?</p>	
<p>Please provide any document that you believe may impact this study.</p>	<p>No other documents have been identified.</p>

Current	Future (2035)								
3 year average is 502 AF/ year	Anticipate no additional change until recycled water becomes available in north Poway or recycled water is extended from the South Poway Business Park to Community Park.								
Our peak calendar use was 2003 @ 600 AF.	Unknown Anticipate no additional change until recycled water becomes available in north Poway or recycled water is extended from the South Poway Business Park to Community Park.								
198 irrigation only customers in the South Poway Business Park.									

Question	Response
Do you have any recycled water quality concerns or requirements?	Yes, the quality is a problem as well as the availability. For example, the water we receive is corrosive. The water is also high in TDS and causes problems for some of the plant material in our South Poway Business Park.
Identify preferred location and diameter of point of connection from the City of San Diego Boundary for wholesale recycled water delivery	Connection already exists on Scripps Poway Parkway. For the north end of Poway, the preferred location would be near Maderas gold club or the boundary of Poway and San Diego on Espola Road.
Do recycled water distribution facilities exist within your jurisdiction? If so, please provide a map if available.	For the South Poway Business Park, yes. For north Poway only for Maderas golf course, which currently has raw water from CWA conveyed through it.
Certainty Assessment of Recycled Water Projections – If recycled water were available to you as a wholesale commodity, what is your confidence that a RW system could be implemented within your jurisdiction?	We old and it has.
What are the key issues effecting RW program implementation?	Capital cost, customer demands, and availability of recycled water.
Is your PA/Water Purveyor willing to provide financial support for customer retrofits?	Unknown, Council consideration
Is a mandatory water reuse ordinance in place or planned for your jurisdiction?	No
Please provide a copy of the recycled water portion of the current Urban Water Management Plan for your agency.	
Do you have any additional comments?	San Diego must start charging its customers the fair market price for the product and recycled water must start paying for itself as a commodity. There has not been a price increase to San Diego customers since 2001 when there was a price decrease. San Diego appears to be operating the reclaimed water system upside-down on purpose to continue collecting credits from MWD and CWA.
Please provide any document that you believe may impact this study.	None

Sweetwater Authority
[Chula Vista, National City and County Area]

City of San Diego Recycled Water Study Request for Recycled Water Plan Information from Water Purveyors within Participating Agencies' Jurisdictions		
Question	Response	
Water Purveyor name and contact information Name Address Phone Email address	Sweetwater Authority 505 Garret Ave., Chula Vista, Ca 91910 (619) 420-1413 hmartinez@sweetwater.org	
Description of Service Area (map if available)	32 square miles within the City of National City, Chula Vista and Bonita (County of San Diego)	
Status of Recycled Water Planning (i.e., plan developed, plan not developed, etc.; indicate availability of documents and provide available reports)	Recycled Water Master Plan was developed in 2005 and later placed on hold after anchor recycled water customer lost interest in financing the project.	
Anticipated Recycled Water Use in Jurisdiction	Current	Future (2035)
Average Use (acre-ft/yr or indicate other units). Please indicate current source of recycled water.	N/A	N/A
Peak Use (acre-ft/yr or indicate other units)	N/A	N/A
Number and Type of Customers		
Do you have any recycled water quality concerns or requirements?	Sweetwater Authority does not have funds to implement a recycled water program, or interest from a developer with a large recycled water demand that can fund the installation of the required recycled water infrastructure. Streets would have to be torn up to install recycled water main in a fully developed service area.	
Identify preferred location and diameter of point of connection from the City of San Diego Boundary for wholesale recycled water delivery	N/A	
Do recycled water distribution facilities exist within your jurisdiction? If so, please provide a map if available.	Recycled water distribution facilities do not exist within our jurisdiction.	

Question	Response
<p>Certainty Assessment of Recycled Water Projections – If recycled water were available to you as a wholesale commodity, what is your confidence that a RW system could be implemented within your jurisdiction?</p> <p>What are the key issues effecting RW program implementation?</p> <p>Is your PA/Water Purveyor willing to provide financial support for customer retrofits?</p> <p>Is a mandatory water reuse ordinance in place or planned for your jurisdiction?</p>	<p>Not a high level of confidence that RW could be implemented at this point in time without funding for required infrastructure or demand.</p> <p>Local demand, required infrastructure cost, and available funding.</p> <p>No</p> <p>No</p>
Please provide a copy of the recycled water portion of the current Urban Water Management Plan for your agency.	See attachment.
Do you have any additional comments?	It is unknown if recycled water will be included in Sweetwater Authority's water resources portfolio due to the lack of local RW demand, high cost of installing infrastructure and available funding.
Please provide any document that you believe may impact this study.	N/A

Other Interested Parties

City of Escondido

City of San Diego Recycled Water Study
Request for Recycled Water Plan Information from Water Purveyors within Participating Agencies' Jurisdictions

Question	Response
Water Purveyor name and contact information Name Address Phone Email address	City of Escondido Utilities Craig Whittemore – Deputy Utilities Manager, Const. & Engineering 1521 S. Hale Avenue, Escondido, CA 92029 760-839-4038 cwhittemore@escondido.org
Description of Service Area (map if available)	
Status of Recycled Water Planning (i.e., plan developed, plan not developed, etc.; indicate availability of documents and provide available reports)	
Anticipated Recycled Water Use in Jurisdiction	Current

Peak Use (acre-ft/yr or indicate other units)	Future (2035)
Number and Type of Customers	
Do you have any recycled water quality concerns or requirements?	Rincon Del Diablo Water Palomar Energy City of Escondido
Identify preferred location and diameter of point of connection from the City of San Diego Boundary for wholesale recycled water delivery	No connection from San Diego is required, the City of Escondido produces its own reclaimed water.

Question	Response
Do recycled water distribution facilities exist within your jurisdiction? If so, please provide a map if available.	The City of Escondido has both production and distribution facilities.
<p>Certainty Assessment of Recycled Water Projections – If recycled water were available to you as a wholesale commodity, what is your confidence that a RW system could be implemented within your jurisdiction?</p> <p>What are the key issues effecting RW program implementation?</p> <p>Is your PA/Water Purveyor willing to provide financial support for customer retrofits?</p> <p>Is a mandatory water reuse ordinance in place or planned for your jurisdiction?</p>	NA
Please provide a copy of the recycled water portion of the current Urban Water Management Plan for your agency.	http://www.ci.escondido.ca.us/depts/ut/UWMP.pdf
Do you have any additional comments?	The City of Escondido has high quality Title 22 water available to inject into the ground water basin of the San Pasqual Valley or for surface introduction to Lake Hodges to help provide a more reliable water supply for the region.
Please provide any document that you believe may impact this study.	

Olivenhain Municipal Water District
(Existing Wholesale Customer)

City of San Diego Recycled Water Study
Request for Recycled Water Plan Information from Water Purveyors within Participating Agencies' Jurisdictions

Question	Response
Water Purveyor name and contact information Name Address Phone Email address	Olivenhain Municipal Water District George Briest, Engineering Manager 1966 Olivenhain Road, Encinitas, CA 92024 (760) 753-6466 gbriest@olivenhain.com
Description of Service Area (map if available)	Recycled water from the City of San Diego is utilized for all or a portion of the irrigation water for 4 golf courses within the District's boundaries. These courses as well as some additional surrounding HOA irrigation demands are generally north and west of the Black Mountain Ranch and Santa Luz developments within the northern portion of the City of San Diego. (See Jennifer Cassimassima for maps).
Status of Recycled Water Planning (i.e., plan developed, plan not developed, etc.; indicate availability of documents and provide available reports)	The area where the golf courses are being served has already been master planned out with respect to recycled water. Generally, with the exception of one additional golf course slated to convert to recycled water later in 2009 or 2010, all of the demands are currently being served with recycled water. This portion of the District is known as the Southeast Quadrant.
Anticipated Recycled Water Use in Jurisdiction	Current Future (2035)
Average Use (acre-ft/yr or indicate other units). Please indicate current source of recycled water.	Currently approximately 500 to 600 AF/YR in accordance with our take or pay agreement. 1000 AF
Peak Use (acre-ft/yr or indicate other units)	Same same
Number and Type of Customers	n/a n/a

Question	Response
<p>Do you have any recycled water quality concerns or requirements?</p>	<p>Availability of recycled water needs to be as certain as potable water. While short (1 day) down times may be acceptable, long term down periods are not as the availability of make up water from the potable system is neither certain nor is it potentially feasible due to health department concerns.</p>
<p>Identify preferred location and diameter of point of connection from the City of San Diego Boundary for wholesale recycled water delivery</p>	<p>Two locations are currently provided for delivery of recycled water from the City.</p>
<p>Do recycled water distribution facilities exist within your jurisdiction? If so, please provide a map if available.</p>	<p>Yes. See Jennifer Cassimassima at the City.</p>
<p>Certainty Assessment of Recycled Water Projections – If recycled water were available to you as a wholesale commodity, what is your confidence that a RW system could be implemented within your jurisdiction?</p>	<p>The District already provides recycled water to its customers via a transmission and distribution system. If additional recycled water were available and reliable, that system may be expanded to include other types of customers and or new service areas.</p>
<p>What are the key issues effecting RW program implementation?</p>	<p>Cost, both for commodity purchase and system operations is the key issue impacting the District's ability to expand it's recycled water system.</p>
<p>Is your PAWater Purveyor willing to provide financial support for customer retrofits?</p>	<p>The District provides financial support to customers who want to retrofit in the form of a loan program.</p>
<p>Is a mandatory water reuse ordinance in place or planned for your jurisdiction?</p>	<p>A mandatory recycled water ordinance is in place which requires the use of recycled water if it is available.</p>
<p>Please provide a copy of the recycled water portion of the current Urban Water Management Plan for your agency.</p>	<p>To follow . . .</p>
<p>Do you have any additional comments?</p>	<p>Cost and recycled water availability/reliability are the two largest factors which affect the District's use and expansion of its recycled water system.</p>
<p>Please provide any document that you believe may impact this study.</p>	

Santa Fe Irrigation District

City of San Diego Recycled Water Study
Request for Recycled Water Plan Information from Water Purveyors within Participating Agencies' Jurisdictions

Question	Response
<p>Water Purveyor name and contact information</p> <p>Name Address Phone Email address</p>	<p>Santa Fe Irrigation District 5920 Linea del Cielo, P.O. Box 409 Rancho Santa Fe, CA 92067 (858) 756-2424 William Hunter, Engineering Manager whunter@sfidwater.org</p>
<p>Description of Service Area (map if available)</p>	<p>See attached map with District Boundaries and potential recycled water customers</p>
<p>Status of Recycled Water Planning (i.e., plan developed, plan not developed, etc.; indicate availability of documents and provide available reports)</p>	<p>Currently purchasing recycled water from the San Elijo Joint Powers Authority (SEJPA) to serve SFID's recycled water customers in the western portion of our service area. Currently utilizing 500 AFY and have near term plans to extend the distribution system to serve an additional 100 to 150 AFY demand. Planning studies have been completed to serve a potential demand of approximately 700 AFY in the eastern portion of SFID's service area. SFID is currently defining the most viable recycled water supply option(s) for the eastern service area.</p>
<p>Anticipated Recycled Water Use in Jurisdiction</p>	<p>Current Future (2035)</p>
<p>Average Use (acre-ft/yr or indicate other units). Please indicate current source of recycled water.</p>	<p>500 AFY Current Source - SEJPA 700 AFY * To Be Determined</p>
<p>Peak Use (acre-ft/yr or indicate other units)</p>	<p>Max Day Ultimate = 1.69 MGD Or 5.18 AF/Day (Note that Golf Course would be about 45% of total)</p>
<p>Number and Type of Customers</p>	<p>1 – Golf Course (275 AF/Y) Various Users/Types (425 AFY)</p>

* In a follow up phone call, SFID clarified that they are currently evaluating purchase of 150 AFY from San Diego via the current Olivenhain WD connection. In addition there is potential for purchase of an additional 700 AFY if the service area is extended to the east.

Question	Response
Do you have any recycled water quality concerns or requirements?	Prefer TDS less than 1,000 mg/l
Identify preferred location and diameter of point of connection from the City of San Diego Boundary for wholesale recycled water delivery	City's existing RW distribution pipeline in San Dieguito Road. We may also be able to tap into an Olivenhain Municipal Water District (OMWD) pipeline currently being served by the City of SD Connection. Hydraulic analysis needs to determine if existing City System can serve demands. Note that our demand could be phased.
Do recycled water distribution facilities exist within your jurisdiction? If so, please provide a map if available.	There are SEJPA RW distribution pipelines in the eastern portion of SFID's service area. SFID will be adding pipelines in the west. There are no RW distribution facilities in the eastern portion of SFID's service area. Planning studies have identified multiple distribution options.
<p>Certainty Assessment of Recycled Water Projections – If recycled water were available to you as a wholesale commodity, what is your confidence that a RW system could be implemented within your jurisdiction?</p> <p>What are the key issues effecting RW program implementation?</p> <p>Is your PA/Water Purveyor willing to provide financial support for customer retrofits?</p> <p>Is a mandatory water reuse ordinance in place or planned for your jurisdiction?</p>	<ol style="list-style-type: none"> 1. Confidence in implementing RW is high. However it will ultimately depend upon the cost and availability of supply, terms of the supply agreement, and cost of the distribution system. 2. The major user in the east is the golf course and they are planning to implement improvements to enable use of recycled water. 3. We are currently working with several potential western service area customers to define on-site retrofit needs. We are working with the SDCWA and others to define financial support options. 4. A mandatory water reuse ordinance is in place.
Please provide a copy of the recycled water portion of the current Urban Water Management Plan for your agency.	
Do you have any additional comments?	
Please provide any document that you believe may impact this study.	SFID has completed a Recycled Water Master Plan, Integrated Water Resources Plan, Asset Management Master Plan, and other documents that define recycled water strategies for our service area.

Appendix J – COST DETAILS

This Page Intentionally Left Blank

APPENDIX J

BASIS OF UNIT COSTS

Unit costs were developed for pipelines, reservoirs, pump stations and treatment processes. These costs were generated using construction bid summaries, actual construction costs of recent projects, opinions of probable costs, related reports, TMs, and studies provided by the City and others. These costs were adjusted to January 2010 using an ENR Los Angeles Construction Cost Index (CCI) of 9761 and include the cost of materials and installation.

Pipelines

Pipeline costs were developed for recycled water pipelines (gravity and forcemain). Data was collected for construction within the public right of way and for use in new developments. These unit costs were then plotted and a best-fit line was applied to the data. Equations for the best fit lines were then used to determine pipeline costs. The pipe material was assumed to be the most commonly used material within each size range.

Unit costs include imported sand bedding and backfill, compaction, pavement removal, hauling, shoring, trench excavation, and testing. The costs assume pavement replacement of half the street width, assumed to be 6-inches thick and 40-feet wide. Additionally, the unit costs reflect cut-and-cover pipe construction techniques and do not consider unusual conditions such as the need for bypass operations, environmental mitigation, community relations, night work, easement/land acquisition, and freeway crossings.

Pump Stations

Unit costs for pump stations were developed using data from existing projects as described above. Pump station costs vary widely depending on site specific requirements (i.e. architectural or noise considerations). The costs include earthwork, concrete, metals, structure, landscape and equipment. The pump station costs include the pumps, building, landscaping, piping and appurtenances. The costs do not include night work, traffic control, and easement/property acquisition.

Reservoirs

The reservoir unit costs were developed using recent project bids, reports, studies, and TMs. These costs are provided for recycled water storage associated with reuse opportunities. Costs were developed for prestressed concrete and steel tanks. Earthen lined reservoir cost is provided for larger reservoirs.

Wastewater Treatment

Wastewater treatment unit costs were developed using recent bids or actual construction costs from several projects. These costs have been adjusted to June 2010 using an ENR CCI of 9962. A Means City cost index correction was used to adjust the unit costs to the Southern California area.
